THE hall shown in the illustration is 100 feet long by 40 feet wide by 45 feet high, and is surmounted by three domes enriched with plaster decoration. The domes are supported on arches that rise from massive piers connected at first-floor level by a balcony giving access to the principal apartments. In the centre of the hall stands a statue of Queen VICTORIA, executed by Mr. FREDERICK POMEROY, A.R.A., and unveiled by H.R.H. the Duke of CONNAUGHT AND STRATHEARN, K.G., &c., December 7, 1905. The hall is lighted by six lunettes formed in the barrel vaults and a three-light window over the principal staircase, the stained glass showing by heraldry the successive dynasties under which England has been governed from the time Woolwich was first mentioned, in association with the names of the more famous owners of the manor of Woolwich of each age. The window over the staircase illustrates the visit of CHARLES I. to see his great ship, the *Sovereign of the Seas*, and PHINEAS PETT, the master shipwright, in the act of presenting the plans of the ship to the king. The inscription is as follows:—"Here, in the month of October, 1637, PHINEAS PETT, the master shipbuilder, having fixed the rigging and sails at the yards, conducted King CHARLES I. on board H.M.S. *Sovereign of the Seas* before her final departure from Woolwich, and the king is mightily pleased. Her building lost the king the affection of many of his subjects, who rebelled against the levy of ship-money." The architect is Mr. A. BRUMWELL THOMAS.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday, the 6th inst., in Tufton Street, S.W., Mr. E. Guy Dawber, the president, in the chair.

Prior to the reading of the paper Mr. Guy Dawber read the following letter from the Secretary of the Royal Institute of British Architects, dated the 5th inst :—

"Your letter of February 14 has been laid before the Board of Examiners, who have reported thereon, and the Council will grant exemption from the intermediate examination of the Royal Institute to those students of the Architectural Association who have passed through the four years' course of the Architectural Association schools in a manner that shall be found satisfactory by the Board."

Mr. Dawber said that the contents of that letter would give the greatest satisfaction to members of the Architectural Association. It was a strong testimony to the quality of the teaching given in the classes. He hoped that the privilege would be extended to the evening classes.

Mr. E. Greenop then read a paper on

Valuations, Compensations, and Light and Air.

In acceding to the request of our Council to read you a paper on these subjects I wish to explain that I lay no claim to any special knowledge upon them. They were suggested to me, and I willingly offer for your consideration this evening a few observations which my limited experience suggests.

I confess that the title of the paper would not have been a tempting one to me in those rose-coloured studentship days which many of you are still happily enjoying. We all start with ideals, which I believe and hope aim higher than the prosaic matters of valuations, compensations, and light and air. Further, this Association exists for the purpose of training architects rather than surveyors, upon whom these matters usually devolve. Not that I hope any of us mind being termed "surveyors," a title honoured by age and borne by greater men than any of us can reasonably hope to become. But we must take our world as we find it, and if we are to grapple successfully with it, we must observe the conditions which its manner of life and requirements impose. In other words, there must be a considerable commercial element in our up-bringing to accompany the artistic training. Without this it is not, I think, possible for an architect to protect the public from whom we derive our means of subsistence. The client has a right to think that the most important factor when employing us is our ability to protect his pocket, and to enable us to attain this qualification something more than the artistic spirit must be added; we must by diligent observation and study make ourselves competent surveyors. The term "surveyor" embraces many departments; but my observation, I think, may fairly cover them all.

With the hope that this short preface will be some justification for this paper at the Architectural Association, I will proceed to unburden myself of a few thoughts, which I trust may be useful to some of you. Were I by some wizard's aid suddenly transformed from an architect to a client, I should, if looking for an architect for my proposed building, choose one who, besides satisfying my artistic instincts, if I had any, was something also of a valuer, something of a land agent and something also of a quantity surveyor. The more this text is considered the more convincing is the sermon that grows out of it, and, example being better than precept, I can recall—and I do not doubt many of my hearers can also—dire results to clients arising from deficiency under one or more of these heads—picturesque results maybe, but built upon an ill-digested financial foundation, leaving a legacy of a precarious 2½ per cent. investment or less. The reason is not necessarily reckless misrepresentation or roseate exaggeration born of the enthusiasm of a young architect to see his long-studied fancies moulded into reality, but ignorance of the broad principles of business and commercial life, which govern building operations equally with dealings in stocks and shares, or, indeed, any other commodity. Everything has its market price, and if we manufacture under such conditions as produce a total cost greater than the saleable value we have failed in applying a first principle of worldly wisdom, and our client may righteously be dissatisfied.

You will note that I am tuning these remarks down to a student's keynote, and this for two reasons—firstly, because any attempt on my part to pretend to put forward original ideas on the subjects of valuations, compensations, and light and air would be as out of place here as they would be presumptuous elsewhere; and, secondly, because I interpret the invitation of the Council to mean that I should say something to enable some of you who may be a little younger than myself to bring your ideas to a useful working focus. In doing this I shall doubtless say much that is everyday knowledge to men of my own age, for which I ask their indulgence. If I should appear to make too lavish a use of the personal pronoun or to speak dictatorially, I must ask you to attribute it to the desire I have to avoid giving you what is readily available in the many excellent text-books on these subjects, and to speak only from my own experiences.

To speak first of valuations. What I understand by value is the price which would be given by the average investor ordinarily on the look-out for the commodity in question. It is conceivable that this is something less than the actual theoretical value, as every man expects to get something, however small, off the theoretical value, or, in other words, to get something of a bargain; but, on the other hand, it may be more than would be obtained upon a forced sale in open market, where it is known to possible buyers that there is from some cause a necessity, more or less acute, to realise at once. The figure is not to be arrived at by running your finger down a printed table, followed by an elementary problem in arithmetic, but by the exercise of a judgment trained by observation and experience, with knowledge of the world and some study of human nature. A good pinch of common sense may be thrown in with the other ingredients.

A common object on a solicitor's bookshelf is a copy of Inwood's "Valuation Tables." I can recall instances in which, as events have transpired, a moderate charge of gun-cotton would have involved a preferable risk. As popular works on legal advice in the hands of a layman are to the lawyer, so is the book of valuation tables in the hands of the lawyer to the surveyor. As this sounds like a rule-of-three sum, you may be looking to me for an answer; I should give it as—ultimate increased business to the professional man and corresponding loss to the unfortunate client. Said a solicitor once to me, "We generally do these private valuations ourselves." To my inquiry as to why he made the particular matter an exception, he replied :—"Well, we found we could calculate everything except the proper amount to be deducted for annual repairs and the number of years' purchase." A reply like that would dispel a London fog. I think it must have been the same sunny temperament which induced the gentleman to instruct me that in valuing a fixed rent-charge I should have particular regard to the then standing price of Consols. However, here we were on common ground, and all I asked was that he would allow me to throw in for momentary consideration a theoretical pound of butter.

The young valuer cannot too clearly keep before him the principle that there is no value in land except for what you can make out of it. This may appear so obvious as to almost insult your intelligence, but it is singular how frequently it is insufficiently grasped. I was once asked by a member of this Association what price per foot super he could offer for a site off Fleet Street. When the full blast of this staggering query had passed over I suggested that, if he contemplated turnips, the price at the moment, having regard to the probable quality, would not probably justify his offering more thas 30s. an acre. Doubtless by this time he has learnt, like the philosopher with the doubtful breakfast egg, to work from the other end. First find what crop is wanted, then calculate what that crop will cost you from seed-time to harvest, and then what the crop is worth in the market when finally gathered. In other words, what building is appropriate for the position is the question to determine—the rest follows. Observation and inquiry alone can assist you here.

When valuing existing buildings one must, of course, have the necessary knowledge to enable one to estimate with accuracy the probable cost of repairs, the deductions for rates, and a deduction for possible loss of rent and similar contingencies. It is not unusual to see 10 per cent. upon the gross rental value deducted for repairs, but the experienced valuer prefers to take each case on its merits. A stuccoed house, for instance, requiring painting externally every three or four years, would obviously necessitate a much larger annual average outlay than a red brick-faced house of the same size; again, the age of the property, the class of tenant, and other such considerations may vary the conditions materially. The parochial rates in the pound are easily ascertained; they vary in London, as you doubtless know, from about 3s. 6d. to 12s. 6d. They are calculated on the net rateable value. I have not time to go into the

Digitized by Google

question of the manner in which under the Rating Act of 1869 this net rateable value is arrived at, but it represents the theoretical net amount going into the landlord's pocket after he has paid out of the gross rent received such outgoings as are necessary to insure the property against fire risk and to keep it in a condition to command the rent. It is a popular error to deduct property tax from the gross rent when making calculations for the purpose of arriving at capital value. There is no such thing as property tax; it is merely income tax, miscalled because it happens to be derived from land or house property instead of from profits of business or the many other sources from which the tax is derived.

In the case of property of small annual value, overseers are legally authorised, if they think fit, to allow a rebate to the landlord upon his paying the rates instead of the tenant, the advantage to them being that he pays whether the property is let or not, and they are not at the expense, trouble and risk of collecting small sums from small tenants. Owing, however, to the increased difficulty of late years of raising sufficient money to meet their many demands, the overseers have in some cases ceased to allow the abatement (usually about 15 per cent.), with the result that the landlords have refused to collect. It has proved to be an interesting corroboration of the belief that the working classes have been under the delusion that they do not pay rates, for, notwithstanding that the amount of the rates has been deducted from the rentals, serious losses have been incurred to owners of such property, owing to their inability to keep tenants, who consider additional burdens are being imposed upon them.

When you have finally got at your net income, you have then to decide upon what is the most important matter, namely, the number of years' purchase to be applied as a multiplier. In other words, what percentage would an investor require during the term in question, in addition, of course, to getting back his capital. Here the tables help you, as far as the mathematics go, but as regards the proper percentage to adopt you must decide this yourselves. In the case of a house, say, in Belgrave Square, an investor would be content—indeed, would have to be so—if he could see, say, 4 per cent. for his money, whereas in the case of an inferior East-end weekly property the expectation of 8, or even 10 per cent., could be justified, the one being well assured, the other more or less precarious.

Valuations of property perhaps more often arise out of mortgage proposals than for other objects. Here I need hardly say the greatest care has to be exercised. Careful inquiry should be made in the neighbourhood in order to compare the rentals of the property in question with those surrounding it of similar character. This is not only a check upon possibly artificially created rentals, but in the case of old-standing tenants it will occasionally be found that the property is under-rented. In making such investigation it is generally possible, with a little humouring, to get information of value from tenants, and it is well to follow up any clue, however unimportant at first sight, as one comes by chance sometimes on information not to be obtained by direct inquiry. Quite recently, by merely following up a casual remark made by a street loafer, I was enabled to get at some facts which I had been for weeks unsuccessfully attempting to obtain through ordinary channels. In weekly property a respectful and sympathetic attention to the recital of the varied complaints of which flesh is heir, of which the female members of this class would appear to enjoy an abundance, will be found profitable, and the continuation of the narrative into the third and even fourth generation backwards may, if borne with fortitude by the surveyor, prove to have a less remote bearing than would appear at first sight upon the subject he is specially concerned with. Old residents will compare the past and present character of the occupants of the houses and drop many useful hints which you will not find in your written instructions, the borrower not having thought it necessary to mention them. At times a visit to the local board offices or vestry hall to inspect the rate-books will be useful, as the rateable values nowadays are usually kept up to date, and, used with caution, are a very good guide as to value. I have always met with courtesy, and at times offers of assistance, at the hands of vestry clerks and their subordinates. Unless you are a ratepayer a charge of 1s. is occasionally made, but your professional card handed in is frequently accepted as a substitute, the object of the charge being to prevent unnecessary inquiries by busybodies, who, having little to occupy themselves with, are over-concerned about their neighbours' affairs. On going to an unknown district examine the particulars displayed in the windows of the local house-agents, usually in the neighbourhood of the railway station.

Where the money to be lent is derived from trust funds it behoves one to be especially careful. The Trustees Act of 1893 throws the responsibility entirely upon the surveyor, as it should do; a trusteeship is a thankless office at best. Trustees are precluded by Act of Parliament from lending upon leasehold property having less than sixty years unexpired. This very much limits the opportunity of investment, and at the present time, when there is so much money always available, it would strike the lay mind as going a little too far on the safe side. It is possible to guarantee the loan made on a property or get it guaranteed by paying a premium to one of the existing guarantee societies, but as the income is reduced by the amount of the premium, and they are fastidious in their choice, I am unable personally to see that they are of much practical use in ordinary everyday transactions one has to deal with.

I fear I have occupied more than its fair share of the time allotted to me to valuations, and must now pass on to the next heading.

Compensation in the sense in which we are here using the term is payment for property compulsorily taken in the public interest. The circumstances which may arise are endless. The most frequent are perhaps those arising out of the formation of and additions to railways, the widening of roadways, the acquisition of land for schools, drainage, &c.

The proceedings are governed mainly by the Lands Clauses Acts, which are generally incorporated with the special Acts obtained by the various bodies acting as promoters. This is not the place in which to go into the procedure in compensation cases, which, as a fact, is looked after by the solicitors engaged. The surveyor's work is confined to making the claim, and supporting it in the witness-box failing a settlement privately. The claimant can elect to go to arbitration or before a jury of laymen, and generally chooses the latter. You are all familiar with the conflicting evidence given by eminent surveyors as to value in these cases. Of course, every allowance must be made for bias, over which the professional mind has a limited control, varying with the individual, but in some cases the evidence given would lead one to consider certain people are more than ordinarily afflicted. However, I think there is little harm done, for if the figures of the promoters and claimant are added and divided by two it is astonishing how closely the verdicts of juries approximate to the result. The young surveyor should be cautioned against the client who has inflated ideas as to his claim, or who imagines that, regardless of the actual value, the more you ask the more he will get. It is you, not he, that will have to go into the witness-box and be cross-examined as to how you arrive at your figures, and he will sit unruffled in court whilst you are having a very uncomfortable time. With such clients it is safer to decline to act, or to limit your evidence to such as you can conscientiously agree to, making him understand that it is open to him to go into the witness-box, since he is so satisfied about it himself, to prove it. This generally brings about the desired result.

The ordinary principles of valuation of course apply to compensation cases. It is usual to add 10 per cent. to the actual value as the recognised solatium for having to part with your property against your will. In one of the recent draft Bills promoted by the London County Council it was provided that compensation should be paid in certain cases, based on the amount which would be required by a "willing seller." As this was no doubt intended as a joke, we cannot do better than end compensations with it.

Light and air.

It is mere trifling to introduce this subject and dispose of it in a few minutes, as I, nevertheless, am compelled to do in order to carry out my undertaking. You all know how such questions have arisen out of the crowding of buildings belonging to different owners in large cities and towns.

Of all the varied matters with which surveyors have to deal, I think light and air questions are the most unsatisfactory to everyone concerned, not excluding the professional men themselves, who, as far as my experience goes, are never in any way adequately compensated for their services. Those services have generally to be performed under great pressure as regards time, the work is fraught with much worry and anxiety, and if you happen to be on the dominant owner's side you are liable to have to listen to such terms as "blackmail," "blood-sucking," &c., from brother architects, who do not want to be interfered with, however much in

Digitized by Google

the wrong they may be. If litigation ensues the proceedings are usually long drawn out, and it is difficult to get the case properly appreciated, and sometimes not even then without models and visits to the premises, which are costly matters. In the end the parties are probably far worse off than if they had settled their differences out of court.

As you are no doubt aware, there have been many methods put forward from time to time for ascertaining the amount of privation of light, but they are theoretical rather than practically conclusive, and the tendency now is rather to rely on the actual opinions of lay as well as professional witnesses upon the question of the quality of the lighting before and after the alleged interference.

In endeavouring to make terms privately with your adversary the opportunity of getting an equivalent for the light obstructed by enlarging windows and skylights should be looked for. Were both sides to employ a reasonable surveyor and be reasonable themselves I believe there are few cases which need be fought.

I endeavour myself to get these cases referred to a surveyor as sole arbitrator. It is a comparatively inexpensive method of dealing with the dispute, and it is generally speedily settled, the latter a point of no little importance where buildings are going up.

I must almost apologise for mentioning the famous case of Colls *v.* The Home and Colonial Stores, so much having been heard of it and so much more having been made of it during the last few months. Put into as few words as possible, the House of Lords decided that, provided a sufficient light remained to the building affected, having regard to the use to which it was ordinarily put, no claim for damage could be sustained against the person building. The plaintiffs in the case made a claim for more than a sufficient light, in which they were supported by earlier decisions. The case was, however, of special interest and value as reviving and restating the existing but dormant law. The earlier decisions laid down that in order to obtain redress for interference with light you must show the interference to be of sufficient importance to amount to a nuisance, and in the older works on "Nuisances," such as "Gibbons's Law of Fixtures and Nuisances," you will find the question of light and air dealt with under the heading of "Nuisances." As was pointed out in the judgment in the Colls case, that which originally was in the nature of a negative right that your light should not be interfered with became gradually looked upon, owing to the tendency of the decisions, as a positive right in the nature of an easement. By its decision in this case the House of Lords brought us back to the point from which we had strayed. The result should, to my thinking, be satisfactory to every fair-minded man. It is the assertion of reason and honourable dealing over selfishness and cupidity.

At the same time, it might be imagined from the statements one hears occasionally that this case presented anyone who cares to avail himself of it with a definite charter to do precisely what he pleases in his building operations, as though his neighbour were entitled to no light at all, except such as the chartered gentleman, in the goodness of his heart, allowed him to retain by special favour. I have had people who knew so little of the case that they have scarcely been able to quote the name of it in an intelligible form quote it against me as though it were a parting shot which settled the whole of my clients' rights, body and soul, for ever.

This, however, is not the case. A man can no more interfere with your rightly-acquired reasonable amount of light now than he could before the case of Colls *v.* The Home and Colonial Stores was tried. In leaving this subject I might mention that one of the Lords Justices in his judgment spoke approvingly of the value of the angle of 45 degrees as a test, and thereby gave, I hope, a new lease of life to it. It may not be very accurate or scientific, but it is very convenient and time-honoured. It is also readily understood by lawyers and laymen.

I may mention in conclusion that a Bill was promoted several years ago, with the combined aid of the Royal Institute of British Architects, the Surveyors' Institution and certain eminent lawyers, for the purpose of dealing with light and air matters on the lines of Part VIII. of the London Building Act, which, as you know, deals with party structures. The Bill is, I think, a most excellent one, but a private Bill of this nature is not hurried on, as you know, in Parliament, and I fear it will be a long time before we see it pass into law.

Meantime we can adopt the procedure for ourselves by referring the matter to a third surveyor. I have now only to thank you for so patiently listening to these, I am afraid, rather disjointed observations.

Mr. Woodward said that Mr. Greenop had imparted into his paper that which he himself sometimes endeavoured to introduce into papers which he was called upon to read, viz. humour. The treatment of so technical a subject as "Valuations, Compensations, and Light and Air" was immeasurably lightened by the introduction of this quality. The paper was also remarkable for the amount of information contained in it, which would be valuable to the student members of the profession, and also to the older branches, if the term might be allowed. It was especially difficult in this case to properly condense the subject in such a way as to come within the limits imposed on readers of papers. Mr. Woodward believed in the advantages afforded by possessing some acquaintance with valuing and quantity surveying. He himself had had the good fortune in the first years of office work to come under a master who taught him these subjects. They tend to produce method in daily work, and enable an architect to protect the pockets of his clients by a knowledge of measurement and prices. In this connection it is important to realise that a client does not employ an architect merely to make pretty drawings. A man can be as thoroughly artistic with as without a knowledge of quantity surveying. There was a tendency to use the word "surveyor" as a term of opprobrium. This was to be deplored. With reference to the words "light and air," it was pointed out that in giving evidence it is better not to introduce the latter, for there is no existing law touching the deprivation of air. With regard to the presence in solicitors' offices of Inwood's "Valuation Tables," Mr. Woodward declared that solicitors knew how to use them intelligently quite as well as surveyors. It is impossible to be too careful in the matter of calculating the number of years' purchase, because there are many charges which must be provided for that do not at first appear. The surveyor cannot remember too clearly that he will be liable for any errors in his calculation or any mishap that may occur in consequence of his misrepresentations. This fact has in some cases been learnt only after a painful and expensive lesson. In one instance an architect was induced by his father's solicitors to value some riverside property on the upper reaches of the Thames. He only afterwards discovered that no tenant would come into the house. In making a report it is well to provide against contingencies by some such statement as "If the house is let at such and such a rental to a substantial tenant on a repairing lease, then it will be worth so much." The necessity for caution will be still further increased if the present Government are successful in passing certain of the proposed measures. The existence of the Taxation or Rating of Ground Values Bill would make a serious difference. The claimant for compensation under the Lands Clauses Acts and similar measures was said to be unwise in his selecting to go before a jury of laymen in preference to an arbitrator, for the former are often not to be relied on. In these cases it is rare that professional witnesses are compensated sufficiently. It is unremunerative work for a busy man who has for indefinite periods to keep himself clear from other work, as well as suffer trouble and anxiety. The paper just read had advocated the use of models as facilitating a proper appreciation of cases arising out of light and air claims. Mr. Woodward believed that models are sometimes desirable, but certainly there are other occasions when they are not, and these latter are in the majority. The method of arriving at injury to light by angles was, he considered, very misleading. Judges are beginning to think that the evidence of surveyors is given with the intention of mystifying. A remarkable measure is Michael Angelo Taylor's Act. Lawyers say that there is nothing which cannot find authorisation in it. It will be found to afford assistance when every other measure fails.

Mr. Max Clarke said that the primary duty of every member of the Architectural Association should be to derive information. They had done so in the paper just delivered by Mr. Greenop. One of the allied objects in holding meetings was to teach the younger members how to speak on such occasions. It would be a matter for satisfaction if those opportunities were more readily seized upon. It was not right that the older members should monopolise the evening. Those who listened to the paper should determine to draw out from the author all the information he was possessed of on the subject. It was perfectly obvious that in professionally dealing with valuations, compensations, and light and air it was essential that one should be

Digitized by Google

equipped with special knowledge. He complained that they had not yet been told how to set about getting that knowledge. What did Mr. Woodward do in the commencement, and did Mr. Greenop or his clients suffer at first? Further, was it to be expected that the clients of those who had listened to the paper would suffer also? Architects are unable to do good work in any of the branches of their profession if they lack a feeling of responsibility and forget that they must do the work of the client who employs them to the very best of their ability. This truism was peculiarly applicable in work arising out of the matters dealt with in the paper. It was illustrated in valuing for clients by a readiness to ferret round neighbourhoods in order to obtain valuable information which might be obtained in no other way.

Mr. M. GARBUTT warned the younger members of some of the difficulties they may have to encounter in the course of their work when endeavouring to arrive at a calculation of the value of any property. It has happened that the information supplied by the parties desirous of selling seemed suspicious, and in consequence a visit was paid to the property for the purpose of interviewing the tenants. The documents and everything else seemed all right. It is afterwards discovered that the tenant has disappeared, he having only been put there in order to deceive. Those who build property for their own special occupation and to suit their own ideas, or after purchasing a house introduce much additional decoration, must be prepared when selling again to receive inadequate compensation for the trouble and expense they have been put to. A point in estimating the value of houses is the class of property by which they are surrounded. Similarly a once fashionable district may deteriorate. Small property is certainly nearly always full, but it may be accompanied by frequently recurring small expenses that cut down a profit that would otherwise be very tempting.

Mr. JOHN MURRAY, who had taken the chair in the absence of Mr. Guy Dawber, said that in order to carry on architectural practice successfully it was advisable to acquire considerable knowledge on these subjects. The calculation of the correct value of property is to be arrived at by considering many facts that are, as it were, only visible to the mind's eye, and bringing other aids to bear. It is necessary to be somewhat versed with the ways of human nature if pitfalls are to be escaped. The difficulty attending light and air cases was familiar to most architects, and they would find it advantageous to keep in mind the words used in the case of Colls *v.* The Home and Colonial Stores. That decision was the same as had been delivered in 1752 by Lord Hardwick. In the opinion of Mr. Murray the passing of the proposed rating Bill would be of very considerable benefit to the public.

Previous to Mr. Greenop replying to the points raised and to the vote of thanks, one of the younger members referred to the remarks that had been made earlier in the evening as to the seeming unwillingness of the junior men to take part in the discussion. This, he thought, might be ascribed to the fact that they never had an opportunity of studying the paper prior to hearing it read on the evening. He was sure that if they were enabled to do this a larger number of those present would express their views. Mr. Murray, in answering this point, explained that only a limited number of copies were sent from the printers, but that if any member wished to see the paper prior to the meeting he had no doubt it would be arranged by the secretary, to whom application ought to be made.

Mr. GREENOP, while admitting that it was useless to bring up a claim for deprivation of light, said it was nevertheless customary to combine the words light and air. Moreover, it was not impossible that the loss of air might not be detrimental to the value of an existing building. In considering the fees charged it ought to be remembered that it was necessary to insure oneself against the consequences that would arise out of a possible future mistake. A man who does work at inadequate fees does an injury to his profession. He complained that there was a lot of misunderstanding, wilful or otherwise, when the desirability of the taxation of ground values was insisted upon. Ground values are already very much rated. The taxation of land which is not being put to any use is against the fundamental principles of economy. Mr. Greenop said that one of the speakers had expressed curiosity as to whether his first clients had suffered through his lack of ripe experience. The best answer to this would be by briefly outlining the facts. In his earliest days, when working in an office, he suffered a rude awakening from the dreams of youth when he found himself being sent on messages in connection with valuation and compensation business practised. After doing this for some time he commenced to take a lively interest in the difficulties which came up, and to ask himself what he would do if he were independent. Shortly after his master began to consult him, and finally took his view altogether. Consequently, when he started a practice on his own he was equipped with actual experience. A guiding principle in any doubt that arose was the question, "Now, if this was my money, should I do that thing or not?" He strongly recommended his hearers not to take an ounce more responsibility than they are compelled to do, or to attach definiteness to a matter of which they are not quite sure. Otherwise they might find themselves compromised.

EXETER ARCHITECTURAL SOCIETY.

THE report read at the annual meeting of the Exeter Diocesan Architectural and Archæological Society stated that the proposed excursion to St. Germans was fixed for May 29, and it was also most probable that the long-talked-of visit to Ford Abbey would be arranged in the autumn. Dr. Brushford had promised a paper on "Chained Books" at an early date. The committee much regretted that before long the old church of Allhallows, Goldsmith Street, Exeter, would be demolished, the fittings being removed to St. Pancras. That would be the fourth church destroyed within about fifty years, the others being St. George, St. Kerrian and St. Mary Major. So the old history of the city in its architecture was fast being obliterated. The City Council had desired a member of the committee (Mr. Harbottle Reed) to inspect the pulling down, in case old work was discovered. Any human remains would be carefully removed and reinterred. The tower of St. Petrock's it was hoped, after all, to preserve. The new church, designed by Mr. Sedding, of Plymouth, for Highweek, was nearly completed, and would be a great addition to the Newton Abbot churches, as those already built (except Wolborough) were not satisfactory from an architectural point of view. The style adopted was Perpendicular, and the nave was unusually wide. The committee were glad to hear that All Saints Church, Withycombe, was to have its tower completed. One of the members (Mr. A. J. Radford) recently came across some interesting Mediæval features at his residence, Dunchideock House. The removal of the imposing Palladian structure known as Mount Radford House, the old manor-house of the Barings at Exeter, disclosed, in the pulling down, many traces of sixteenth-century work, and also work of an older structure, which had been at a late period clothed in a pretentious exterior of stuccowork. Numerous remains of mullions and windowwork, and other features in Beer stone lay prostrate amongst the ruins alongside, mixed with the shafts of Doric columns, &c. Close by numerous small houses were being erected on the estate. Some rich examples of old work remained in the partially dismantled Larkbeare House, in the valley below Mount Radford House. At Hennock Vicarage two sixteenth-century wood windows of three lights had been revealed, and were being reopened. One had a most unusual feature, viz. oak stanchion bars. The centre of the house had some sixteenth-century oak-framed partition work, with a doorway into the kitchen, which possibly was the little sanctum of the vicars of Hennock, which came from Torre Abbey from 1259 to 1537. Some double oak partitions originally filled with cob were also discovered. The attention of one of the secretaries had been again called to the fact that one of the original "misereres" in the choir of the cathedral, removed during the restoration in 1870-7, was now in the cathedral library. The committee suggested that the odd one of Perpendicular work, now among the thirteenth-century ones, should be removed, and the original one, of Bishop Bruere's work (1224-44) put in its place, so as to complete the fifty of that bishop's time, which were the most perfect and complete examples in existence, one having the earliest known carving of an elephant, though it was questionable whether the carver had ever seen a live one, as he carved the knee joints the wrong way. No doubt the bishop had seen them when he was taking part in the wars in the Holy Land and told the carver about them, but forgot to mention the legs. The committee were glad to see the decided improvement of the street architecture of the city, and hoped that when anything more was done, the houses might be designed in keeping with the remaining

Digitized by Google

houses of the sixteenth or seventeenth century, so as to retain the picturesqueness of the old streets. The report was adopted and the committee and officers re-elected.

THE DUNDEE ENGINEER'S CLAIM.

THE following communication has been addressed by Mr. Mackison, the burgh engineer, to the members of the Town Council of Dundee :—

Having regard to the recent meetings and discussions on the subject of the administration of the burgh engineer's department, I feel that I am being unfairly treated, my position prejudiced and my professional status injured, in consequence of certain letters and reports, which I have submitted to the town clerk and committees, being suppressed and not minuted. I therefore beg to submit the following facts for your consideration. At the board meeting of the Council on February 1 last, notwithstanding that I had handed in a report dated January 22 last, addressed to the markets and baths committee, referring to certain grave irregularities in the administration of the department under my charge, the town clerk did not bring the said report under the notice of that meeting. I had previously submitted that report, which was partly read to a meeting of the works committee held on January 22. The minute of said meeting, however, contained no record of said report having been partly read or referred to. The markets and baths committee met on the same evening, immediately after the works committee meeting, and, although this meeting was specially called to consider the matters referred to in said report, the deputy clerk was prevented on that occasion from reading said report, and no minute whatever has been made of this meeting. The meeting of the markets and baths committee, dated January 23, 1906, was not held on that date, but on January 22, as I have already stated, and should have contained a reference to the matters in connection with the Miller's Wynd baths and wash-houses which formed the subject of my said report. The report in question being thus suppressed, I wrote the town clerk on February 10 bringing the matter again under his notice, and pointing out that, as a special committee had been appointed to consider the administration of the department under my charge, that committee might consider the matter. The town clerk made no reply to this letter in writing, but verbally informed me that the special committee would not take up the matter in question. The minute of meeting of said special committee held on February 12 contained no reference to my said letter of February 10, or to my subsequent letter of February 12, which were both intended for said committee. The markets and baths committee had their usual monthly meeting on February 13, at which the town clerk might have submitted my said report of January 22, but did not do so. Another meeting of the special committee was held on February 19, but no reference was made in the minute of this meeting to my letters of 10th, my two letters of 12th, and my letter of February 17, notwithstanding that my letter of February 17 was read at said meeting.

Another meeting of the Council was held on March 1, but the town clerk again failed to submit to the board my report of January 22 and the letters before mentioned, notwithstanding the fact that a member of the Town Council called for the letters in question to be read. The town clerk on that occasion only admitted having received two letters from me after the meetings in question, while, in point of fact, he had received other three letters from me before said meetings, making five in all. Mr. John Robertson, works convener, is also reported to have stated at said Council meeting that "no letter from Mr. Mackison had been submitted to him, and had never been read to the sub-committee or any committee." This is not the fact; as I have already stated, the letter of February 17 was read at the special committee meeting at which I was present. In consequence of this further failure on the part of the town clerk to submit my report of January 22 to the Town Council I wrote him on March 13 as follows :—"I beg to direct your special attention to my letter to you of 10th ult., bringing under your notice my report of January 22 last addressed to the markets and baths committee, left by me in the hands of your deputy, and since then (January 22) allowed to remain in your hands undisposed of, and have to request that you forthwith submit that report to said committee for their information and instructions." At the meeting of the markets and baths committee held on 13th ult., at which my letter above quoted was read, it was stated by the town clerk that he could not find my report of January 22 last, and I accordingly produced a duplicate copy, which I had in my possession, which was read to the meeting. On March 14 the town clerk wrote me as follows :—"I return Messrs. Twyfords, Ltd., accounts in connection with the Miller's Wynd baths, which you left with me last night. The committee instructed that these should be passed through the accounts and paid in the ordinary way. Please have this done." On March 16 I replied to the town clerk as follows :—"I have yours of the 14th inst., with enclosures. Messrs. Twyfords' accounts for baths and tubs supplied to Miller's Wynd baths and wash-houses, to which I specially referred in my report of January 22 last, and which were again under consideration at the markets and baths committee meeting on Tuesday, 13th inst., cannot, I regret to say, 'be passed through the accounts and paid in the ordinary way,' inasmuch as the goods charged for in said accounts have not only been wrongly purchased by my assistant, Mr. Thomson, and Mr. M'Gregor, superintendent of the baths, against the specific instructions and standing orders of the Town Council, as pointed out in said report, but are likewise defective in quality and not, in my opinion, of the value stated. I cannot, therefore, certify the accounts in question and herewith return same to you." Notwithstanding that my report was read at said last-mentioned meeting of the markets and baths committee, and notwithstanding the town clerk's letter to me of March 14, that the markets and baths committee had instructed the passing of the accounts referred to in the report in question, the town clerk has not stated in the minute of meeting of said committee that my report had been read to that meeting, or that the committee, as stated in his letter to me above quoted, had passed the accounts. The town clerk having thus again failed to submit to the Town Council, through the committee to whom it was addressed, my said report, or to record the decision of its committee on the subject, I have now no other alternative but to bring the whole matter thus specially before you as a Council. I have also, at the same time, to bring under your notice a report, with three relative letters, which I handed to the town clerk on March 19, dealing with the administration of the burgh engineer's department, and the actings of my assistant and two members of the Council. This report was prepared, as you are no doubt aware, in accordance with the standing instructions of the Commissioners, dated July 12, 1894, and specially communicated to me by the police clerk. This report was not addressed to, nor was it intended specially, for the works committee, but for the whole members of the Town Council, to whom it now falls to be submitted. The works committee, before whom it was read, had no power whatever to remit the said report to the special committee, so far as the actings of the two councillors therein mentioned were concerned, nor had the special committee any authority whatever to deal with this matter or to make any deliverance thereon. The minute of the special committee of March 20, so far as the remit from the works committee is concerned, is therefore quite irregular and ought to be deleted.

The town clerk controverts the statements, and he quotes a letter from Mr. Mackison in which he states that he had no intention of making any imputation regarding the character of the deputy town clerk. The town clerk deprecates the procedure followed by the engineer in submitting reports and communications in a manner that differs from that adopted by other officials.

EDWARDIAN MASONRY.

ACCORDING to the Rev. James King, B.D., vicar of St. Mary's, Berwick-on-Tweed, in the course of excavation on the site of the old post office of Berwick the workmen last week uncovered the exterior face of an ancient stone wall. The masonry is about 6 feet high, 20 feet long, and seems to continue its course eastward in the direction of the sea. The stones, which are composed of the close-grained sandstone used in all the Edwardian fortifications, are built in six regular courses, squared and dressed, and so closely fitted together that the workmen could scarcely thrust their trowels between the joints of the masonry, while the stonework resting upon the wall and forming the lower part of the comparatively modern dwelling-house is merely rough rubblework. The block of masonry is of the same character as the fragments of ancient masonry fronting

Digitized by Google

the Tweed on the river banks by the new road. It is, however, a better finished piece of work, inasmuch as the fine jointing and regular courses of the stones contrast favourably with the gaping joints and uneven coursing of the decaying fragments on the river bank. The former bears marks of being built leisurely at a period free from any disturbing element, while the latter bears marks of being hastily reared at a time of danger. The history of the military vicissitudes to which this ancient borough has been exposed seems to throw light upon the age and aim of the recent discovery. In the year 1316 A.D., two years after the battle of Bannockburn, the old Lanercost chronicler records the fact that King Robert the Bruce, with a large army, came secretly to Berwick and attacked it by moonlight, "hoping to have entered the town on the river side between the Bridge House and the Castle, where the walls were not yet built." Edward I., the builder of the fortifications by the Bell Tower, had been in his grave for nine years when Bruce made the above attack, so that the decaying walls facing the Tweed are not the work of Edward I., but are probably the work of King Robert the Bruce, who took Berwick in 1318 A.D., and determined to strengthen the town and castle as being an important fortress, and a key to the sister kingdom of England. The accession of Edward III. to the throne of England in 1327 A.D. was the harbinger of a dark era for Berwick. Bruce died in 1329 A.D., and Edward, a dashing soldier and one of the greatest English kings, soon showed signs of hostility to Scottish independence, and having gained a great victory over the Scottish forces at Halidon Hill in 1333 A.D., he perpetrated great butchery on the vanquished foe, and marched his victorious troops to Berwick, which readily capitulated to the English army. Throughout his long and prosperous reign, extending over half a century, Edward III., distinguished as a great military monarch, regarded Berwick as his chief fortress of the north, and much of his time was devoted to the extension and strengthening of its fortifications. The strong, well-built masonry brought to light by the excavation at the old post office last week is probably the work of Edward III., and formed a portion of the extended wall running eastward from the wall of King Robert the Bruce along the present Bridge Street and Ness Street towards the sea by the present pier.

VAUXHALL BRIDGE.

THE London County Council on May 19, 1903, upon the recommendation of the late bridges committee, approved the design then submitted of the new Vauxhall Bridge and the proposed architectural and artistic treatment of the same, but reserved for future consideration the question of erecting propylæa on the abutment piers. Models have been prepared and designs submitted for propylæa which are suitable for erection on the bases as now constructed. With regard to the question whether any artistic treatment at all of the abutments should be attempted, it is considered that unless something be done in this direction the bridge will appear in every way incomplete and unsatisfactory. The alternatives are therefore presented either of erecting propylæa on the abutments or of covering them with large groups of statuary. There will be little difference in the cost of the two schemes. In the opinion of the improvements committee the erection of propylæa will produce a much better effect than groups of statuary, and it is recommended that the Council should sanction the erection of propylæa. Models of the propylæa, and copies of a statement describing the same have been placed in the lobby of the Council chamber. One of the models (No. 1) is square and of plain design; the other (No. 2) has rounded ends and some decorative treatment of the sides. The total estimated cost of erecting, in granite, propylæa for both approaches to the bridge, in accordance with design No. 1, would be 12,600*l.*, while, if design No. 2 be adopted, the cost would be 15,120*l.* The committee think that design No. 1 would be in greater harmony with the general features of the bridge than No. 2, and propose that it should be adopted, but ask the Council for authority, if necessary, to introduce some slight modification on the Lambeth abutment. The arrangements to be made for the erection of suitable figures on the summits of the propylæa have been also considered. Mr. Alfred Drury, A.R.A., has been engaged in collaboration with Mr. F. W. Pomeroy, A.R.A. (Mr. Drury being the contracting artist), to model and cast the panels for the piers of the bridge, and it is considered that he should also be engaged to design and provide the figures for the propylæa. He is prepared to provide four subjects, different in design but in harmony with each other, in a composite material, for a total sum of 2,800*l.* The material is an excellent one, and has been used, amongst other works, for the fountains at Versailles and for work at Hampton Court. It is recommended that Mr. Drury's offer should be accepted, but that Mr. Bertram Pegram, who was originally suggested by the bridges committee to collaborate in the work, should be associated with him in the provision of two of the groups. The unexpended balance of the several votes passed by the Council for the construction of the bridge is amply sufficient to cover the cost of the works proposed.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A COMPARISON of British and American methods in steel building construction was given by Mr. J. Roxburgh Sharman, A.M.Inst.C.E., in a lecture to the Edinburgh Architectural Association. Mr. Sharman noted the remarkable growth in the use of steel construction in this country, and he showed how American methods were modifying the older practice of British architects. At the same time he indicated that the best practice in both countries was coming very much into line. The Americans were modifying their latest buildings to correspond more with British ideas; we, on the other hand, were getting to appreciate the advantages which steel columns had in building. He showed that the Americans were becoming more modest in the matter of height, the limit of the later buildings being twenty-four storeys. A large number of interesting pictures were shown of the "skyscraper" in course of erection, the marvellous speed with which the building was got in hand was indicated, and admiration was expressed at the splendid organisation of the American engineer. By way of favourable comparison, Mr. Sharman mentioned the expedition with which the Singer's new factory at Kilbowie was erected by Messrs. M'Alpine. This huge building contained 23,000 tons of brick, 7,000 tons concrete foundations, 14,000 ferrolithic, 4,000 steelwork and 1,500 in timber. Its construction occupied about six months, which was a record in building construction even compared with America. The lecturer also discussed the question of loads, and thought probably a safe and good practice would be found in adopting loads somewhere between the extremes of America and Glasgow—dwelling-houses and tenements, 80 lbs. per square foot; theatres and hotels, 100 lbs.; halls, schools, churches, &c., 140 lbs. Mr. Sharman was cordially thanked for his lecture, on the motion of Mr. Tarbolton, the president.

YORK ARCHITECTURAL SOCIETY.

A MEETING of the York Society was held on the 5th inst. in the lecture-room of the School of Art, when a paper on "English Architecture in Later Stuart Times" was read by Mr. C. F. Innocent. Mr. A. Pollard presided. The period of English architecture under consideration, said Mr. Innocent, was that of the four later Stuart sovereigns, from the restoration of the monarchy in 1660 to the death of Queen Anne in 1714, a period lasting little more than half a century, but one of the greatest interest to the student of English architecture, for not only was an immense amount of building done, but during this time the designers emancipated architecture from the crudity of Jacobean design. The architecture was marked by great restraint in design, a restraint which remained in the smaller buildings throughout the eighteenth century, but in the larger buildings was swept away by the exaggerated Palladianism of the Earl of Burlington and his followers. The sanity and practical common sense which mark so many of the designs of the time was largely due to the influence of Sir Christopher Wren, who was the greatest architect of the period, and who continued in the practice of his art until the eighty-eighth year of his age. He was the architect of St. Paul's Cathedral, a building in which an untrammelled display of his powers was prevented by the Court and the clergy. In addition to St. Paul's, Wren also rebuilt some fifty of the London churches destroyed—like the cathedral—in the Great Fire; in these Wren's powers of design are shown at their best, and the various types into which they may be grouped, with the justly celebrated steeples, were illustrated. It was an age of the building of great houses, greater even than those of Elizabeth's time.

Digitized by Google

Wren built the royal palaces of Greenwich, Hampton Court and Kensington. Other great houses of the period were Ashdown, designed by John Webb, pupil and son-in-law of the famous Inigo Jones; Chatsworth, of which the architect was William Salman, the rival of Wren; Castle Howard and Blenheim Palace, the work of Sir John Vanbrugh. In the planning of houses at this time the square or rectangular block with entrance hall in the centre and rooms at the sides came into general use; it was descended from the Mediæval house with its hall in the centre, through the symmetrically planned houses with projecting wings and centre halls of the Elizabethan period.

A vote of thanks was accorded to the lecturer on the proposition of Mr. Davis, seconded by Mr. Burleigh.

RHIND LECTURES.

IN his fourth Rhind lecture in Edinburgh Dr. Haverfield sketched the civilised and settled life which arose in Southern Britain as the outcome of the establishment of a military frontier in the north. It was an important subject, he said, for it was involved in one of the most difficult and serious problems of early English history. The two elements, Roman and Celtic, combined, as in other provinces, in a compromise. The late Celtic art nearly vanished; it survived in Caledonia and in Ireland, but in Britain the neater Roman fabrics drove out the native fashions, despite their artistic charm and quaint interests. Only in a few points could we discern its survival. Only in a few cases could we trace that living love of artistic ornament, that vivid delight in fantastic forms which marked the later Celt. Politically the Roman British world had, of course, no freedom, but much Home Rule. The land was divided up among cantons; their nobles were the magistrates of the cantonal districts, and the towns were the canton capitals. As in Gaul, the Romans allowed the cantonal system to continue. Their tolerance was justified. The cantonal nobles did not form centres of national resistance. Instead they took up Roman ways and speech and adopted Roman titles to describe their office. Politically, therefore, as well as artistically, the land grew Roman. Dr. Haverfield at this point threw upon the screen sketches of towns, country houses and villages, in illustration of his lecture, and pointed out that there were several types of British and Gaulish house, but that all looked outwards. They would not fit into streets and belonged to a non-town civilisation. He thereafter passed on to art architecture, and ordinary decoration. The mosaics, he pointed out, were classical. No single mosaic probably in all Roman Britain introduced a local or topical scene—only conventional hunting-pieces or Greek mythology or geometric decoration of classical type were found. Even the language, at least in the towns, was Latin. This Roman civilisation was destroyed by the Gauls. It existed only in the first area conquered by the Saxons. A remnant of civilised Britons was driven out, but they left the centres of civilisation and retired to lands where civilisation and civilised men were alike few. They became civilised, and that in part was why parts of Wales and Scotland still spoke Celtic.

The fifth lecture treated of the Roman occupation of Scotland. Rome, like all States, he said, had its two parties of Imperial administration, its Radical and progressive party, which always desired to advance and widen the Empire, and its Conservatives, who desired, at any rate, not to go forward. At Rome, as elsewhere, they could trace the pendulum swinging between the two tendencies, and whenever the Progressives were in power there was activity and advance. They could trace three periods when the Progressive policy dominated in Britain—in the time of Agricola, and in that of Pius, and in that of Septimius Severus. Each of these movements was strictly dominated by geography. The advance northwards in England must be either east coast or west coast, and for English purposes alone the east coast was, and always must be, the best. But when they had to advance into Scotland the position altered. Newcastle or even Berwick were not such good bases as Carlisle, and southern Scotland centred round the one strategic isthmus between Forth and Clyde. And to reach this isthmus was easiest from Carlisle. Two or three routes led through the hills towards it. The easiest was that of the Caledonian Railway from Carlisle by Beattock and Clydehead. The next best were those that ran from the English Tyne across Cheviot to Jedburgh, either by Redesdale and the Carter (the line once projected by the North British Railway) or by Deadwater and the Wheelcausey, a route often followed by moss-troopers. Agricola, it was probable, advanced up the west coast. They could trace vague indications of his presence in Cumberland, and perhaps also at Birrenswark. But it was not likely that he used only one line. Certainly they found at Newstead, where important excavations were now proceeding in most auspicious fashion, an earlier fort than that of Pius, and remains belonging to the first century. Anyhow, they knew that he occupied the Forth-Clyde isthmus. That Tacitus told them, and evidence had been forthcoming at Camelon, near Falkirk, in the shape of early pottery, and at Barhill, lately dug in very admirable style by Mr. Whitelaw, of Gartshore, and soon he hoped to be no less admirably described to the public. The line of Agricola's advance was fixed by geography. It must have run by Falkirk and Stirling and Perth and Coupar-Angus, along the Caledonian Railway line towards Aberdeen. But the extent of his advance was more doubtful. Their one account of it was by Tacitus, and Tacitus wrote it partly to canonise Agricola and partly to blacken the Emperor Domitian who recalled him, and wholly without reference to the twentieth century A.D. The book was a drama, in which Agricola won a fifth-act fight at Mons Graupius (that, not Grampius, was the correct spelling, though Grampius had been anglicised as Grampian, and hence was the more familiar to them). The battle was a stage battle. He would undertake, if it were made worth his while, to turn out an excellent case for its having been fought near any ancestral mansion north of the Clyde. But it was one of those fights that lay outside time and place, and he should content himself with observing that the true solution was not to argue but to dig. They had had too much talk about this site; it were best to use their eyes and hands and keep their mouths shut for a while. Archæology would help them. It had already done so at Inchtuthill, where was a large encampment and a bath-house, ten miles north of Perth, in a strong and strategic position. There, as coins, or rather one coin, indicated, they might think Agricola camped for a good while. They should go on to dig up other sites—Comrie, Abernethy, Strageth, Inveresk, Cramond and the like, where Roman remains had occurred. Agricola's work did not last. There was evidence at Barhill of early abandonment. There was general scantiness of early remains. In detail it might be uncertain how much of the north was abandoned. But in 125 the frontier was south of Cheviot. The second advance was that of Pius. The wall of Pius was plainly a basis of frontier defence, like Hadrian's, not a final end. There were forts north of it, and Hadrian's wall was not given up meanwhile. Like the advance of Agricola, that of Pius also did not last long. Coins show it was abandoned by 180 A.D. Septimius Severus made the third advance about 208. He might have visited Edinburgh in his great punitive exhibition, as coins of his were hereabouts. But there was no kind of evidence as to details. The Roman occupation of Scotland was a purely military occupation. At least 150 miles separated it from the nearest civilised parts of Britain, the villages and towns of central Yorkshire.

Correspondence

Rebuilding of Nuneaton Church.

SIR,—Might I ask on what authority your informant of the intended rebuilding of the above calls it an abbey church?

I have complete lists of the 200 abbeys of England, the thirty-seven of Scotland, the seventeen of Wales, the fifty-seven "greater" priories and all the "lesser" priories, yet Nuneaton is not among any of the English monastic edifices on those lists.

There is too great a readiness to take for granted that monastic buildings of less importance than abbeys were abbeys. The church above referred to I may find as having belonged to a friary or a convent, but it is not classed in any of the lists I have referred to, and which I have sorted and checked from the eight big volumes of Dugdale, with verifications at times from Stevens or Tanner where there was any uncertainty. As I wish my lists to be complete and accurate I should be glad of "chapter and verse" for your informant's authority that Nuneaton could boast rightly of having a real and not a so-called abbey in its midst. By

Digitized by Google

so-called, I obviously wish to convey the meaning of the abbatial dignity being mistakenly conferred on a priory, friary or convent by local enthusiasts whose sole authority may possibly be either legend or mere hearsay.—Yours faithfully, JOHN A. RANDOLPH.

GENERAL.

A Collection of ninety-two pictures lent from the London Guildhall will be exhibited in the Kelvingrove Gallery, Glasgow, during the summer months.

An Exhibition of works by German artists, to be held at Prince's Skating Rink, Knightsbridge, W., will be opened on May 20. Professor Von der Velde, architect, is making the necessary structural arrangements.

Mr. Kenneth J. S. Harris has been selected out of 250 candidates for the post of borough surveyor by the Wisbech Town Council. The salary is 175*l.* per annum, together with other emoluments.

Mr. T. Anning Bell and Mr. T. M. Rooke are to be appointed as examiners for the Arts Scholarship Examination and Exhibitions in the London County Council schools. The usual fee is 21*l.* in each case.

The French President opened the exhibition of pastel paintings on Sunday last. It is the twenty-sixth of the series, and contains examples by several of the French painters.

The Court of Common Council have decided that an art loan exhibition of pictures should be held in the Guildhall Art Gallery in the summer of next year at a cost of 450*l.*, exclusive of insurance. The Court agreed with the recommendation.

Mr. E. W. Dyson has been appointed architect for the new Council schools which are shortly to be erected in Race Common Road, Barnsley, at a cost of between 11,000*l.* and 12,000*l.*

Mr. Leslie Wood, F.S.I., of East Grinstead, has gained first prize of 20*l.*, offered by the Carpenters' Company, for an essay on "The Treatment of Woods and Plantations from the age of twenty years to maturity, with full details as to thinning, marketing and demand for various purposes at different periods of growth."

M. Jules Grosjean, the sculptor, has died in Paris in his thirty-fourth year. He lately obtained the commission for the memorial of Gerôme, the painter and sculptor, which is to be set up in Vesoul.

Holborn Town Hall was put up for auction on Monday at the Mart, Tokenhouse Yard. In the auctioneer's prospectus and general remarks the property was described as "valuable and extensive freehold, having a frontage to Gray's Inn Road of about 101 feet, a frontage of about 123 feet to Clerkenwell Road and a total ground area of about 12,800 feet." The first bid was of 10,000*l.* and the last 25,000*l.* There being no further offer the building was withdrawn.

Mr. J. B. Goodacre, architect, Mansfield, has been successful in a competition for a new Carnegie library to be erected in Pleasley Hill, Derbyshire.

A Painting of Franz Hals, *A Youth playing a Mandoline and holding a Green Glass Goblet*, was sold by public auction in Dublin, and was purchased by a London firm for 3,650*l.*

The Glasgow Corporation have been given notice of the following motions:—(1) That it be remitted to a special committee to consider and report upon the advisability of the Corporation adopting a policy whereby vacant land within a ten miles' radius of the city be acquired. (2) That the Corporation authorise the tramways committee to pay over to the Common Good all surplus revenue, to be expended by the Corporation on the purchase of unoccupied land within a radius of ten miles of the city as opportunity occurs.

The Furness Railway Company having sold the cottage at Dalton-le-Furness, Lancashire, where Romney was born in 1734, it was reported that the building was to be demolished. Owing to strong representations from all parts of the country the cottage has been repurchased by the railway company and will be put into good repair, a visit to it being included in some of the company's summer tours.

Mr. Charles Martin, the painter, who recently died, exhibited his first work in the Academy in 1836. He is best known as a portraitist, though he painted subject pictures and even modelled statuettes. Among his sitters have been Mr. T. L. Donaldson (1872), painted for the Institute of British Architects, of which he had been president; a medical student of Edinburgh (1871); Joseph Bonomi, curator of the Soane Museum (1867), and several other members of the family; and Peter Cunningham (1859). Charles Martin was at the Academy schools with Millais, in Rome with Leighton.

The New Central Criminal Court is not sufficiently advanced to be opened in May by the King as was expected. The date has been postponed indefinitely.

The Lincolnshire Architectural Society have arranged to make Norwich the headquarters of its annual meeting this year on June 12 and 13. One day will be devoted to the city and one to excursions in the neighbourhood.

The Local Government Board for Ireland give notice that at an examination of candidates for qualification as assistant surveyors in Ireland held on March 1 and 2, under article 4 of the General Order of February 9, 1900, the undermentioned candidates have qualified in the prescribed subjects:—1, James N. Down; 2, Frederick O'Brien; 3, Jeremiah O'Leary; 4, Thomas Mulcahy; 5, Maurice Murphy; 6, Martin Tierney.

Appeals have been made for contributions towards the sum of 1,140*l.* required to complete the purchase of the Tudor house known as Barrington Court, near Ilminster, Somerset. The property will be under the control of the National Trust. An anonymous donor has offered 10,000*l.* conditionally.

The Clerk of the London County Council has informed the Further Strand Improvement committee that the improvements committee will receive on May 2 a deputation in support of the memorial. Until its presentation on May 2 the memorial may be signed at the Royal Academy of Arts, Burlington House; the Surveyors' Institution, 12 Great George Street; the Society of Architects, Staple Inn Buildings, or at the office of the honorary secretary, 7 Pall Mall. The Surveyors' Institution have subscribed 5*l.* 5*s.* towards the expenses of the committee.

The Court of Common Council, at a meeting on the 5th inst., considered a report concerning the so-called Sir Christopher Wren's house. The Lord Mayor received a letter a month ago from the President of the Local Government Board enclosing a communication with reference to the impending demolition of the house in Love Lane, Billingsgate, the Corporation being asked to secure it for the purposes of a museum or for some similar object. The library committee now reported that there was a doubt as to whether the house ever had been in the possession of Sir Christopher Wren, and further, that the majority of the objects of interest had been removed. Under the circumstances they recommended that the Court should take no steps for the acquisition or preservation of the premises.

The Secretary to the Treasury was asked last week in the House of Commons how long the Ruskin paintings, now being restored at the Gallery of British Art, had been the property of the nation; who was responsible for their having been withheld from public view; and whether means would be taken to insure that any other work of art in the possession of the country should be either exhibited or disposed of. Mr. McKenna, in reply, said that the paintings and drawings by Turner, known as the Turner Bequest, were placed in the custody of the National Gallery trustees in 1856, and the responsibility for not exhibiting them rests with the trustees and director of the Gallery for the time being from that date onwards. He could not give a pledge which would involve interference with the discretion of the trustees and director in deciding whether works of art entrusted to them should be immediately exhibited.

Reports from Khartum, says the *Glasgow Herald*, state that building operations are entering upon a stage of unprecedented activity. The call for building materials and labour is so persistent that a remarkable rise in the prices of both has resulted. One cause for this activity is that the time limits of many holdings of land elapse in a short period, and owners therefore build to save their property from confiscation. Fortunately the higher prices in land and the growing demand from European residents induce more substantial building, and in a far better style of architecture than in the past.

The Architect.

THE WEEK.

On Wednesday there was terrible destruction of life and property in San Francisco, and for once it cannot be said that architects and builders were in the least degree responsible for the calamity. The selection of a site for a city in a region which was subject to earthquakes may now be considered unwise, but there are so many advantages offered by the position, the most nervous people will not suggest an abandonment of it. San Francisco will be rebuilt, and the destruction may lead to improvements. It is not to be expected, however, that a different system of construction will be adopted. The City Hall, which cost about a million and a half pounds, the Stanford University Buildings, the lofty office buildings and immense hotels have succumbed, equally with the wooden houses which were for temporary use. At present it would appear as if no precautions can withstand the tremendous forces which can be exerted by the mysterious power which exists beneath the habitable surface of the globe.

The death on Saturday last is announced of Mr. Robert A. Bryden, an architect who was much esteemed in Glasgow. He was in his sixty-fourth year. At an early age he became a pupil of Messrs. Clarke & Bell, and he rose to be principal assistant, and subsequently partner in the firm. Afterwards he opened an office of his own, and latterly his son, Mr. Andrew Bryden, was in partnership with him. He designed several important buildings in Glasgow, and as an expert his services were often sought by litigants. He was associated with the late William Quarrier, the philanthropist, and designed the homes at Bridge of Weir. He took a share in municipal affairs and rendered services to the public in several ways. He was an admirable type of the Scottish man of business, and was not deficient in genial humour. His death will be regretted by all who knew him.

The Portsmouth Waterworks Company sought to obtain powers from Parliament during the present session for enlarging the area of the watershed from which the supply is drawn. The town, from its naval and military establishments, is of peculiar importance, and deprivation of water might result in serious consequences to the whole country. The Portsmouth Town Council intended to oppose the Bill, but after negotiations it was agreed to insert a clause by which the Corporation would be able to acquire possession of the water company's property. A meeting was held on Monday, when it was agreed almost unanimously to obtain control of it. Each shareholder will obtain sufficient Corporation stock to secure him 4 per cent. The outlay under this head will be 897,187*l.* 10*s.* The debenture stock and the terminable debenture debt will be taken over and paid off, as well as all debts, liabilities, contracts and obligations of the company. The directors and auditors of the company are to receive 12,757*l.* 10*s.* as compensation. The works are to be taken over as they stand with or without investigation, but it is believed that they are in thorough working condition and repair. The conditions appear to be satisfactory, and if the Bill before Parliament should be discussed, there is little doubt about its becoming law.

There is no city in France which more plainly suggests that at one time it was a part of the Roman Empire than Nimes. The Maison Carrée, the Temple of Diana, the tower, the gates and the Pont du Gard in the neighbourhood are all evidence of the dominion of Rome. A discovery which has recently been made reveals that the Romans were not attentive to architectural and engineering works alone. A sarcophagus has been found near one of the old Roman roads which may be considered as being a museum on a small scale. In it was a beautiful alabaster vase, which preserved the ashes of some young Roman lady. There was also a coffer which contained a collar of gold and precious stones, a ring with a cameo on which was carved a figure of Eros holding a quiver, a tapestry frame in ivory, several vases, a mirror, and, in fact, all the works of ornamental art which the lady possessed. They have been placed in the archæological museum of Nimes in a special case. Apart from the intrinsic interest of the objects the discovery is important, inasmuch as it suggests that France as an archæological field is not yet exhausted.

In 1902 a departmental committee was appointed to inquire into the constitution, powers and duties of the Board of Manufactures in Scotland—a body that, in addition to aiding several industries, has exercised vast influence over the fine arts. It was recommended that the Board of Manufactures should be transformed into a Board of Trustees having fifteen members. The President was to be an artist who was a member of the Royal Scottish Academy. The Board was to exercise a general supervision of the National Gallery and the National Portrait Gallery. A Bill has been introduced into the House of Commons with the title "National Galleries of Scotland Bill," which proposes to give effect to the recommendations of the departmental committee. Instead of fifteen members there are to be only seven, who will hold office for five years instead of eight, as originally suggested. The question of a chairman is to be determined by the Secretary for Scotland, but apparently it is not essential that he should be an artist. The Trustees are to have the management of the National Galleries of Scotland, the several buildings situated in Edinburgh and known as the Royal Institution, the National Gallery and the National Portrait Gallery, and of Dunblane Cathedral. The expense of the maintenance and repair of these buildings by the Commissioners of Works, together with the expenditure incurred by the Board of Trustees in the payment of officers and otherwise in connection with the management of the National Gallery and the National Portrait Gallery, is to be defrayed out of moneys voted by Parliament. The question will, no doubt, arise as to what is to be done to increase the accommodation for pictures in the National Gallery. It will be remembered that Mr. Honeyman proposed the erection of a new building on the Calton Hill. The Royal Scottish Academy also requires larger space, and other bodies have similar needs. The Bill is therefore likely to be made the subject of several lengthened debates.

The proposal which M. Paul Escudier is to bring before the Municipal Council of Paris has caused much consternation among French sculptors. The number of statues in the streets of Paris has long been perplexing, and the cry is still they come. Several committees exist with the object of finding money to put up a statue to anybody who gains a little notoriety, and it might be supposed there was a rivalry between the streets of Paris and the cemetery of Père-la-Chaise. In fact, a guide to Paris should now be supplemented by a biographical dictionary. There is no doubt the sculptor's art is encouraged. But, on the other hand, the possibility of obtaining a commission for a statue of some notability is an inducement to many students who enter on sculpture without a knowledge of the sacrifices which are inevitable. M. Escudier proposes to begin by prohibiting the appropriation of any part of the Champs-Elysées, the Parc Monceau and the Cours-la-Reine as a site for a statue. This, no doubt, will grieve committees who obtained subscriptions by holding out the prospect that one or other of these places would be assigned by the Municipality for the proposed statue. By excluding such favoured positions the opportunities are increased for utilising places in less favoured districts where a statue would be an advantage.

MENGS AND VELASQUEZ.

AMONG the 9,000 people who visited the National Gallery on Monday last a large number must have been attracted by the opportunity of seeing the latest addition to the collection, the *Venus and Cupid*, or *Rokeby Venus*, by Velasquez. It would be interesting to discover how many of them were able to appreciate the style of the painter as exhibited in that work. What Sterne called the cant of criticism still unfortunately prevails among us; and although admiration of Velasquez is general of late years, the reasons given for it are not very clear. Velasquez is essentially a painter's painter, and his qualities can only be appreciated by those who have had more or less practical experience in the use of colours. He is not one of the self-revealers to those who see him for the first time. It requires, however, some courage to acknowledge that paintings are beyond us. But in the case of Velasquez, if his works appear undeserving of all their praise a strong excuse is forthcoming. A picture by him was not seen in the National Gallery prior to 1846, and the hunting-piece was not of a kind that would rival masterpieces by other artists. Indeed, it may be said it was owing to the writings of Richard Ford that the Spaniard was able to gain a footing in this country.

The neglect of Velasquez was not confined to England. If the experts who accompanied the French troops were competent to understand his value there is no doubt the paintings would have been carried off to France and dispersed. Artists and amateurs followed one or other of the numerous roads to Rome, and it was accepted that in Italy alone painting was to be studied. We believe that the first artist outside Spain who was courageous enough to pay a tribute to Velasquez was Raphael Mengs. In his case the recognition was remarkable. Mengs, like many other German artists, was as much an æsthetician as a painter. Fuseli, who bore some resemblance to him, describes him as a deep scholar whose writings are full of most useful information, deep observation and often consummate criticism. He was born in Dresden in 1728, and was the son of a Danish painter. He exhibited so much talent when he was a boy, he was sent to Rome in his thirteenth year, and on his return three years later he became Court painter to Augustus III. of Saxony. He preferred, however, to live in Rome, and quickly went back. When he was twenty-six he was elected President of the new Academy of Painting in Rome, and he obtained commissions for altarpieces and other works. Twice he lived in Spain, where he was appointed principal painter to the king. Many grandees were proud to patronise him. He was recognised as a legislator who was able to lay down the law for all living artists, and as one who alone was able to explain the principles of the ancients. Among those who sought knowledge from him was Winckelmann, who is described by Fuseli as a parasite for the fragments that fell from the conversation or the tablets of Mengs. In return for the favours he received Winckelmann lauded Mengs as the foremost artist of the age, and one who was never likely to be equalled. He believed him to be a resuscitated Raphael, whose mission it was to demonstrate by his own works what is possible for human forces to achieve. The fact was that Mengs sought after a higher ideal in form than the *Apollo Belvedere*, which to Winckelmann was the noblest example of art. But as a painter Mengs not only was unable to realise his aspirations, but he could not paint a figure which suggested a living being. He played a practical joke with Winckelmann and the cognoscenti by representing a pseudo-Greek figure in ancient style which was accepted as a genuine discovery. But he was not endowed with the qualities which were demanded for ordinary work. In everything he did the influence of an ancient master was perceptible.

Mengs's defects, however, made him an admirable critic. Possessing definite ideas about what should be attained by painters, he was able to point out how far they approached or departed from his ideal. To scrutinise representatives of all the Italian schools in his way would require a life of patriarchal length. Mengs therefore confined himself to three painters, Raphael, Correggio and Titian. He analysed their drawing and modelling, their chiaroscuro, their colouring, their composition, their ideals, and then compared their results with those of the ancients. It is needless to say that with a man of his class victory was always with the ancients. There might, for instance, be no surviving examples of Greek colouring. But, as Mengs said, "I imagine to myself that Zeuxis and Apelles were not only true but very beautiful in their colouring."

To ask a man whose prepossessions were so strong to assess the value of a collection of Spanish paintings displayed at least great confidence in Don Antonio Ponz, who was the intermediary. He wished to describe Spain and its treasures, and the contribution of Mengs about the Spanish schools is not the least interesting part of the eighteen volumes which were produced. The inquiry was not without advantage to Mengs, for he was compelled to take a broader view of art in general. For the first time he recognised that there could be different styles of painting, some of which at least merited approval. There was the sublime style, the beautiful style, the gracious style, the expressive style and the natural style which imitated nature. There was also the vicious style, which was adopted by some imitators of Michel Angelo, Correggio and masters of the Lombard school. There was, moreover, the facile style, which could be attained by many amateurs without much effort. Whatever the style it was subject to laws relating to drawing, light and shade, invention and composition. The three Spanish painters whose works he had to consider were Velasquez, Ribera and Murillo, examples by whom were to be seen in the principal apartments of the king in Madrid. Mengs was struck with the truth and intelligence in the treatment of chiaroscuro displayed in the works of Velasquez. It is said that he understood the effect of the ambient air which is interposed between objects, and by the treatment enables us to recognise the distances separating them. The examples of the three periods of the master form, it is said, a school for artists in which they can discover the method followed by the painter in order to arrive at so excellent an imitation of nature. Mengs points out especially *The Water Carrier of Seville* as evidence of the restraint which Velasquez imposed on himself in imitating nature. Although his endeavour to be exact has made the picture appear to be a little dry and hard, yet we can realise the essential difference in treatment between the parts which are illuminated and those which are in the shade. The picture, we believe, now belongs to the Duke of Wellington, and was exhibited a few years back at Burlington House. Another painting noticed by Mengs is *Los Borrachos*, in which Bacchus crowns some drunkards. In it we are told Velasquez imitates nature, not as it is, but as it appears to be—a distinction which was made for the sake of theory. *The Forge of Vulcan* does not recall Homer, but Mengs insists that the Cyclops are a perfect imitation of nature. Of the *Fileuses* or *Hilanderas* Mengs remarks that the hand of the artist does not seem to have had any part in the execution of the work, which seems to be created by a single act of the will—words which are often erroneously applied to the works of the painter in general. Concerning the portrait of Donna Marguerita of Austria, Mengs declines to say anything about the beauty of the subject, for the lady was not lovely. But he said that it proves to us what effect is generally produced by the imitation of nature, and still more when mere beauty is not supposed to be the principal object which is sought. The equestrian portrait of Philip IV. excited admiration through the painting of the horse as well as the figure of the king. His Majesty's head was finished with so much care that the skin appears to be transparent.

Then, as now, the royal portrait was a pendant for one of the Duke D'OLIVAREZ, which MENGS considered was in no way inferior—a proof of honesty on the critic's part as well as on the painter's. A picture hung in that part of the palace called *del Ritiro degli stati del Regno*, and which represents the *Surrender of Breda*, is said to have all the perfection belonging to the subject. But MENGS states that the lances which form so remarkable a part of the painting were not executed by the master's hand. In another part of his criticism VELASQUEZ is placed on a level with CORREGGIO and REMBRANDT.

It may have been because MENGS as a critic was identified with MENGS as a painter that so little notice was taken for a long period of the works of VELASQUEZ. WILKIE was amazed when he came in front of the works of the great Spanish painter. His whole style became altered, although the people who bought pictures at that time were not satisfied with the new manner. A similar effect has been produced on painters from other countries. Of late years many critics have become votaries of VELASQUEZ. But amidst all the enthusiasm, it should not be forgotten that when the indifference was strongest RAPHAEL MENGS risked his reputation in order to have justice done to one of Europe's foremost artists.

AN ACADEMY RECORD.*

THERE is sometimes a misgiving among those who contemplate the purchasing of works in several volumes that the series will never be completed, and accordingly they hesitate about subscribing. There need be no apprehension of that kind in respect of Mr. GRAVES's Dictionary. The fifth volume has appeared, and the conclusion of the excellent work is consequently within sight. All who have gone through the volumes will be ready to admit that Mr. GRAVES has merited to have his laborious and costly undertaking crowned with success.

Among the architects whose names appear in the fifth volume the most successful was JOHN NASH. No architect was made the subject of more criticism. Some years ago his Regent Street was condemned because of its monotony and the unsubstantial character of the houses. But of late years, when questions of great roadways have become prominent, it is recognised that, with all its shortcomings, there is no more effective thoroughfare in the Metropolis. JOHN NASH began exhibiting in the Academy in 1796. He was then in his forty-fourth year; he continued regularly until 1803; he had no work in 1804, and his last design was seen in 1805. There was accordingly nothing to suggest his metropolitan improvements, or his work for GEORGE IV. in Buckingham Palace or at Brighton. At a time when so many architects were sending in designs for temples, altars and sublimities for which no client could pay, it is really pleasant reading to find in the majority of cases that NASH presented views of buildings which he had erected or was about to erect. In 1797 were "Alterations to Corsham House" and villas at Dulwich and Southgate Grove. In the following year among his works was a conservatory for the PRINCE OF WALES. Helmingham Hall, Nonsuch Park and a Quadrangle at Magdalen College, Oxford, were other exhibits.

Whatever might be said about the Academy in later years, there is no doubt that in those days there was a desire to encourage architectural draughtsmanship. The committee of selection this year would be likely to take it as a very poor joke, if not an insult, if any man were to submit plates which he intended to use in a treatise on perspective. THOMAS MALTON was allowed to do so. His son, THOMAS MALTON, jun., probably sent in more drawings, not designs, but views of buildings than any contributor. Between 1773 and 1803 he exhibited about 130, the majority derived from various parts of England. A large number, if not all, were engraved. The old rule of eight subjects was not enforced in his case, for in one year he had thirteen views of London. The plates which bear his name, and which are still in request among collectors and dealers, suggest his ability. But it is remarkable that so clever a man never erected even a cottage. He sometimes contributed, like so many of his contemporaries, designs for a triumphal bridge, a bath, a prison, a temple, and on one occasion a design for the curtain of Drury Lane Theatre. Another member of the family, JAMES MALTON, likewise prepared many architectural views. Several of them were derived from Dublin, where all the MALTONS appear to have found employment.

An architect who enjoyed a large practice and was a contemporary of the MALTONS was THOMAS LEVERTON. In 1771 there was a design by him for Woodford Hall, Essex, then in course of erection. In 1783 he showed three drawings of "Penitentiary Houses," for which he had received a premium from the Government. Two years afterwards he sent a view of one for 600 male and 300 female convicts. At the time prison reform was receiving attention. HOWARD had published his revelations in 1775. It was found that in several of the prisons or bridewells no food was allowed, and in county gaols, although food was given for murderers and highwaymen, there was none for debtors. In some gaols no sewers existed, and as the window tax fell on the gaolers, windows were stopped, regardless of the stifling of the prisoners. In 1778 an Act was passed for the establishment of penitentiary houses. Three commissioners, including HOWARD, were appointed to select a site for the first, which was to be at Islington, and there was a second to be set up at Limehouse. Differences arose between the supervisors, and the project fell into abeyance. In 1792 JEREMY BENTHAM offered to provide a penitentiary or panopticon on a circular plan at his own cost. Two years afterwards the Government agreed with him to erect a prison for 1,000 convicts for the small sum of 19,000*l*. Lands at Tothill were purchased, but it was not until 1816 that a part of the Millbank Prison was completed. The outlay on it was about half a million sterling. LEVERTON's design was therefore never carried out.

The only drawing of the late Professor HAYTER LEWIS exhibited was in 1839, viz. "Sketch for a Cathedral formerly proposed to be erected in Manchester." THOMAS LITTLE exhibited between 1832 and 1851 several designs, including chapels at Nunhead Cemetery and St. Mark's Church, Regent's Park. The attraction of the nobility for English people is suggested by the designs produced by T. LLOYD between 1813 and 1817; they comprise a "Park Entrance for a Nobleman," a "Design for a Nobleman's House," a "Design for a Nobleman's Seat," a "Design for a Nobleman's Mansion" and a "House in Castle Style." Whether any commissions came from plebeians after looking at them is not recorded. SAMUEL LOAT was another designer of ambitious works. His subjects comprised a national gallery, a theatre and an Italian palace. The first gained him the gold medal and travelling studentship in 1828. He returned from Rome in 1832, and exhibited a design and section of the Corsini Chapel. What became of him is unknown. Another prizeman was W. C. LOCHNER; he won the gold medal. In 1808 he exhibited a design for a triumphal building; in 1811 a design for Bethlem Hospital, which gained for him in conjunction with J. H. GOOD the first premium. He also is another of the exhibitors who appeared and disappeared within a few years. GEORGE MADDOX was at one time expected to attain a high position as an architect. C. R. COCKERELL and DECIMUS BURTON were among his pupils and owed much to his teaching. In 1796 he exhibited a design for a villa, and this was fol-

* *The Royal Academy of Arts.* A Complete Dictionary of Contributors and their Work from its Foundation in 1769 to 1904. By Algernon Graves, F.S.A. Vol. V., Lawrence to Nye. (London: Henry Graves & Co., Ltd., and George Bell & Sons)

Digitized by Google

lowed by Roman monuments, a church at Greenock, and an architectural study. But to the end of his life he was looked on only as a fastidious drawing-master.

One work of Frederick Marrable's is sufficient to indicate the growth of administration in London. Appointed as architect to the Metropolitan Board of Works he designed the offices in Spring Gardens, which have now to be supplemented with a large number of temporary offices. In 1843 he exhibited the Prescot Workhouse, in 1861 the Holborn Viaduct, in 1863 the Garrick Club, and subsequently the church of St. Peter at Deptford.

The painters and sculptors are best remembered of the artists whose works are enumerated in the fifth volume. Complaints are made about the number of portraits accepted. But Sir Thomas Lawrence did not hesitate to send a dozen to a single exhibition. His contributions reach 311. No other artist, we suppose, was ever so fertile in one class of work. Millais does not approach him, for although he might show eight examples in a single exhibition, they were varied in character. Lord Leighton, although great as a portraitist, sent very few examples of that kind. His first work was seen in 1855, and it was the well known *Procession of Cimabue's Madonna*, which is now in Buckingham Palace. Charles Robert Leslie began exhibiting in 1813. He gained his renown by delightful humorous scenes, but his first work might have been inspired by Fuseli, for it was a murder scene with a motto from "Macbeth." The next year he showed the Witch of Endor raising the ghost of Samuel, and in 1816 the death of Rutland in "Henry VI." By 1819 he had discovered where his strength lay, for he sent the painting, which was afterwards engraved, of Roger de Coverley going to church. In 1822 appeared "The Rivals," and in 1824 "Sancho and the Duchess." For nearly forty years there followed what Thackeray calls a series of noble works, which delighted the world by calling into pictorial presence, and informing "with life, grace, beauty, infinite friendly mirth and wondrous naturalness of expression, the people of whom his dear books told him the stories, his Shakespeare, his Cervantes, his Molière, his Le Sage." A painter of varied abilities was Edwin Long, who upheld his position from 1855 to 1891. An artist who should have been an Academician was Charles Lucy, and who, from the list of his works, was consistent in the adoption of incidents which were worth representing on canvas.

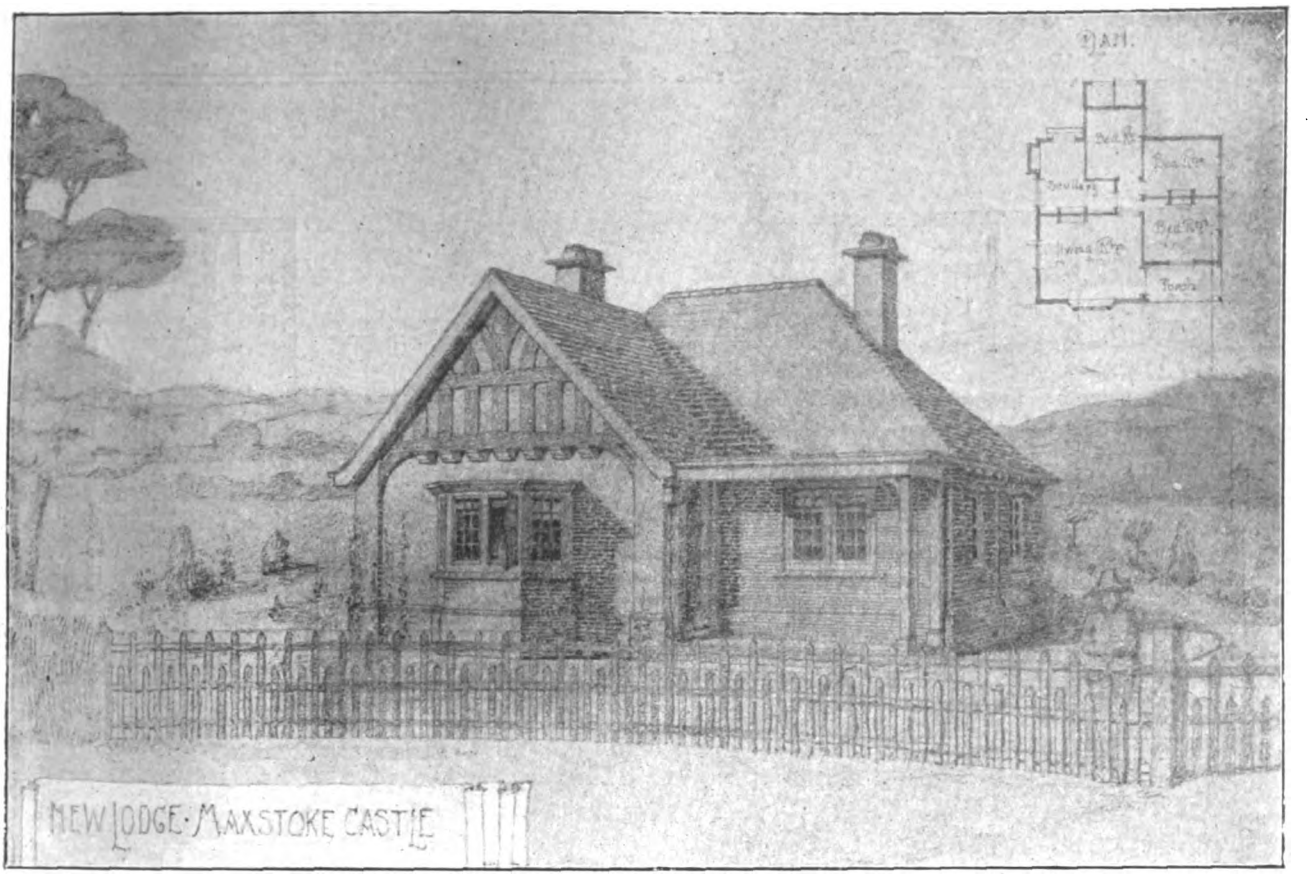
The volume also records the numerous works of Daniel Maclise, who seems to have conquered from the time he came to London. He entered the Academy schools in 1828, but next year he was able to have a scene from "Twelfth Night" exhibited. He might have been the fashionable portrait-painter of his time, but he rarely had more than one portrait in an exhibition. It may now seem strange that a man who was so sculpturesque in his figures never attempted to work in relief. Henry Stacy Marks was more dry in his humour than Leslie; but the course he commenced with his *Dogberry* he followed for over forty years, *i.e.* from 1853 to 1897. Numerous as were his works, there was only one portrait among them. John Martin, who painted *The Deluge*, *Pandemonium*, *The Fall of Man*, and various other difficult scenes, might not be supposed to have his works approved by Academicians. He was an exhibitor in 1811. His *Clytie* in 1814, who was supposed, instead of languishing for the sun, to be all night on the trackless wild teaching the listening rocks her moan, was not satisfactorily hung. But Martin continued to exhibit until 1852, when he closed the series by a characteristic *Destruction of Sodom and Gomorrah*.

William Mulready is also summoned before us. He exhibited in 1804 views of Kirkstall Abbey, and his last work was seen in the exhibition of 1862. To the end he was an earnest student. There can be no doubt that he prized the Academy, and his election to an Associateship in 1815 and to membership in 1816 had a wonderful effect on his powers. In 1816 he exhibited *The Fight Interrupted*, in 1819 *The Loan of a Bite*, and in 1820 *The Wolf and the Lamb*—three masterpieces. Although his pictures were sought after, year after year he exhibited no more than a single example. Many more works which are identified with the history of English art could be cited. And, indeed, amateurs will find it a pleasant occupation to refresh their memories by turning over the pages of Mr. Graves's volumes.

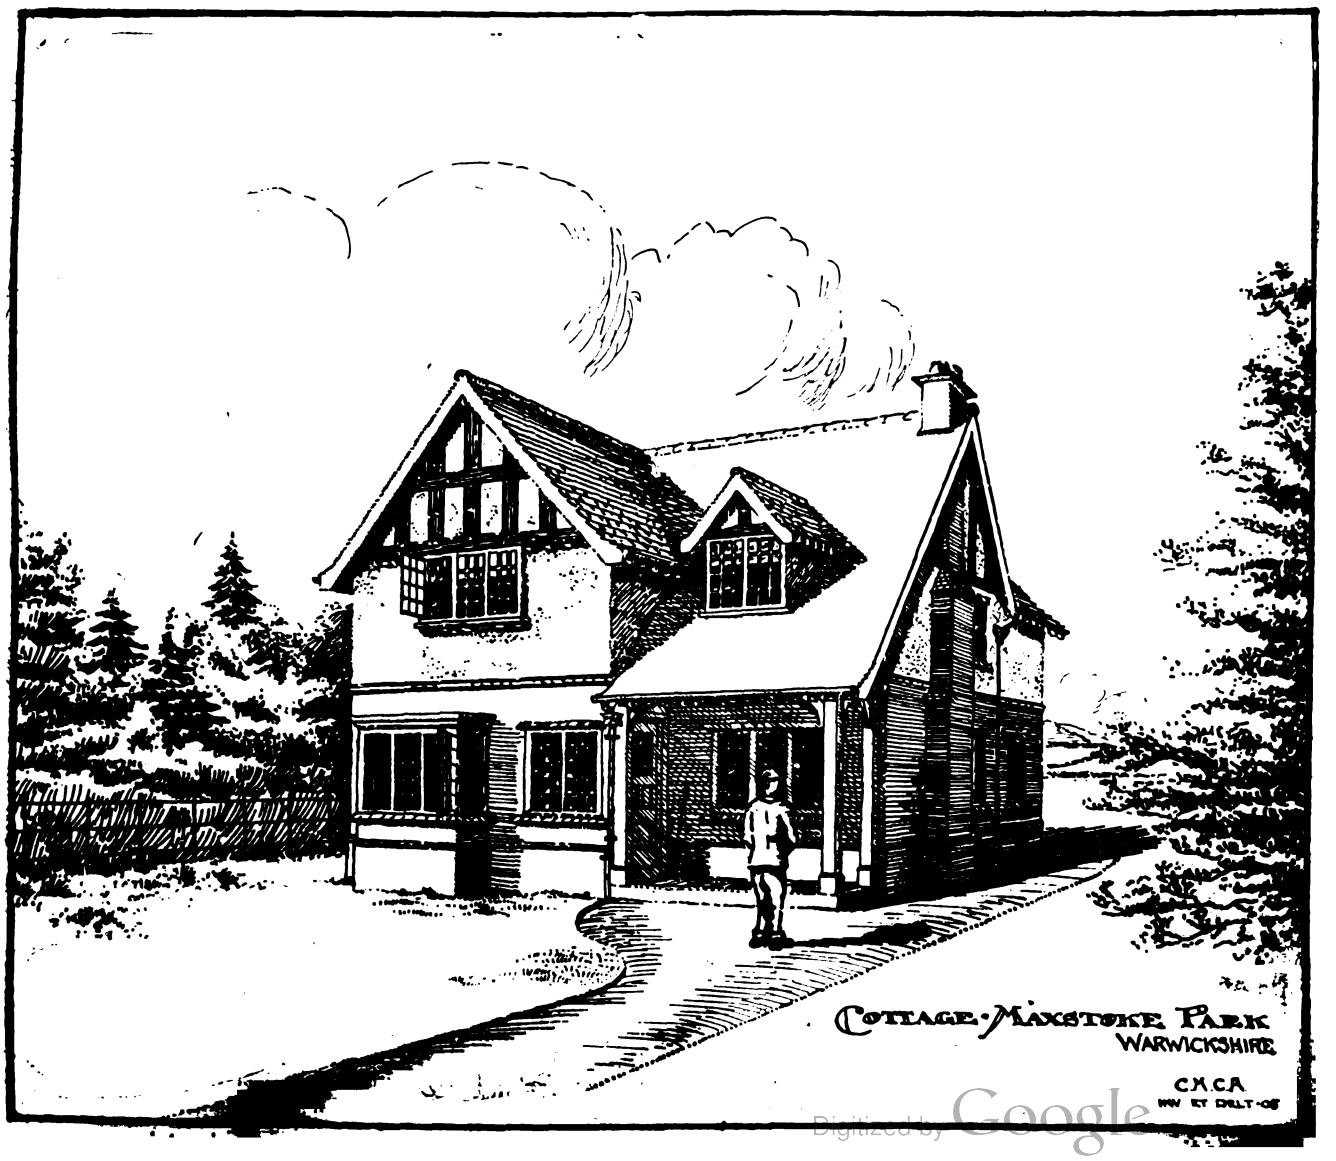
LODGE AND COTTAGE, MAXSTOKE PARK.

THESE two buildings were recently erected at the above for Mr. B. T. Fetherston. The bungalow lodge is faced with Mark Lloyd's 2½-inch sand-faced bricks, and the cottage with Kenilworth selected stocks, the upper portions being cement rough-casted with projecting half-timber gables. Dark Rosemary tiles cover the roofs, with half-round ridges. The windows are filled with leaded lights by Harvey & Ashby, and have tile cills and heads, the same material being used as cappings to chimneys. Oak posts, lintels and brackets are introduced in the porches. The cottage was planned with the idea of same being used on occasions as gentleman's quarters, which accounts for the double living-room, dining-room, bath-room, &c.

The whole of the work was carried out by Mr. Frank Davis, builder, of Moseley, Birmingham, under the superintendence of the architect, Mr. Charles Armstrong, of Warwick.



DEVON AND EXETER ARCHITECTURAL SOCIETY.



THE annual meeting of the members of the Devon and Exeter Architectural Society was held at Tiverton, and attended by Mr. B. Priestley Shires (Plymouth), president, Mr. Harbottle Reed (Exeter), vice-president, also Messrs. John M. Pinn, C. J. Tait, C. Cole, P. Morris, J. A. Lucas, O. Ralling (hon. treasurer), L. F. Tonar, F. Jerman, A. Stevens, H. W. Bulley, J. H. Shearer, A. N. Tucker, F. A. M. Rawes (Exeter), A. S. Parker, W. H. Mays (Plymouth), W. H. Williams (Paignton) and Allan J. Pinn (hon. secretary), Exeter.

The annual report stated that there were now 50 members, 13 associate members and 31 associates, making a total of 94, a net increase of 8. Several matters of importance had been dealt with by the Council during the year, and the exhibitions of drawings submitted for the R.I.B.A. and studentships were much appreciated. A book prize for measured drawings was awarded to Mr. G. B. Sellick, of Plymouth.

The retiring president, Mr. B. Priestley Shires, then delivered his address, in the course of which he said:—There is a laudable desire to make the profession we have the honour to belong to worthy of the work the members have to perform, and I dare say you have already heard of or read the report of the registration committee to the R.I.B.A. of their labours, extending over fifteen meetings, in hearing evidence and views of twenty-four architects from various parts of the country for and against registration. A step in the right direction has been unanimously arrived at in the formulation of a scheme for raising the qualification of architects. It is proposed to revise the Charter of the R.I.B.A. and submit a Bill to Parliament, which I consider does not go far enough. What we as architects in the provinces, or at any rate the greater number of us, have desired and expected all along is that the title of architect should be registered. At the present time anyone, however limited his knowledge of draughtsmanship, construction or of his art generally, may call himself an architect, and still his services as such are absolutely of no value whatever to the public or anybody else. However, it is sufficient for me to say, registrationists and non-registrationists have met on common ground and discussed this old problem, and for the present have agreed on certain lines to work upon together, and perhaps as years go by new phases will present themselves, and perhaps at no distant date.

PLANS FOR COTTAGE

MAXSTOKE CASTLE PARK
WARWICKSHIRE

Scale of Feet

Ground Plan

First Floor Plan

I take this, my earliest opportunity, of congratulating Mr. Paton, borough engineer, Plymouth, for his exhaustive report on building by-laws presented to the special works committee a few days ago. We all know that many reforms are urgently required to building by-laws in all parts of the country. Some three or four years ago Mr. Parker directed our attention to the matter in very able papers both to the parent Society and our Three Towns branch. Subsequently the members of the Three Towns branch formulated certain amendments. With some of them Mr. Paton found himself in agreement, and no doubt this important report will, as far as the district around Plymouth is concerned, prove of great benefit and prosperity to the town. We hope and trust that after further careful discussion of proposed new by-laws a set will be framed that the Local Government Board will find no difficulty in approving. Building by-laws should be made to suit the district in which they are to operate.

An oft expressed wish, that all buildings of a public character should be put to competition, we still as architects adhere to. I think I am right in saying that if county councils, boroughs, boards of guardians or any other promoters of architectural competitions will treat us fairly and recognise certain conditions, I am sure the most critical would not find anything more fair and more considerate as between competitor and promoter than the conditions as laid down by the R.I.B.A. They would always find some of us ready to give them the best of our ability in solving problems in the interests of the community. We do not want any wire-pulling or underhand favouritism from promoters. What I know of the architects of this province is to work in the best interests of the promoters, provided proper conditions are laid down. Our Society is founded upon good principles, to cultivate a love of architecture for its own sake, to promote a fraternal feeling amongst our members so that we mutually may appreciate and take pleasure in each other's triumphs. That our efforts are crowned with all the success we would wish, no one could say; but that they have met with some results no one who knew our profession in Plymouth or Exeter before the establishment of our Society could deny. Let us be strong to combat injustice to our brethren whenever attempted, to be aggressive even when needed, I should most strenuously advise, and to become strong, to remain just, to grow in knowledge and in honour, these are all consistent with using our strength and our knowledge in fostering the well-being of the profession so long as it remains honourable and just. So long as these are our aims and motives, so long will the Devon and Exeter Architectural Society progress in strength and in influence.

Mr. Harbottle Reed, of Exeter, was afterwards elected president. In returning thanks for the honour, he said he would endeavour to advance the interests of the Society as his predecessor and those members present who had been presidents had done before him. Mr. M. A. Bazeley, Plymouth, was elected vice-president, Mr. Allan J. Pinn, hon. secretary, Mr. C. Ralling, hon. treasurer, and Messrs. P. Morris, W. H. May and C. J. Tait were chosen to fill the vacancies in the Council.

THE DEANERY, CARLISLE.

A PAPER was read by Mr. J. H. Martindale at the spring meeting of the Cumberland and Westmorland Antiquarian Society, on "The Deanery, Carlisle." In the course of it he said, according to the *Carlisle Journal*, that the old group of buildings, rising above the ancient walls of the city, so familiar to all travellers to Scotland, with the marks of centuries stamped on the walls, and known as the Deanery, are most interesting and instructive from many points of view, and yet very little has been written about them. It is not my intention to describe the buildings from documentary sources, but simply outline to you the various changes made in them as far as I am able to read them from the history written in stones. We possess comparatively few residences, omitting episcopal houses, of the greater ecclesiastical dignitaries still occupied and used by the present holders of the original office. Of the nine English cathedrals of the old foundation only two, Wells and Exeter, possess residences of the date of Carlisle still inhabitable. In the thirteen cathedrals of the new foundation only five, viz. Canterbury, Durham, Chester, Winchester and Rochester, have portions of the building in use, while in the case of the large monastic houses the buildings are more or less in ruins, and in most cases only with the aid of Mr. St. John Hope can the outline of the

Digitized by Google

plan be traced from foundations just visible above the ground. But here in Carlisle—and we must remember it was the residence of the Prior long before there was a Dean of Carlisle—we have a building which has been used by the head of the cathedral chapter for between 400 and 500 years, and it replaces still earlier buildings. The long building we see to-day is the outcome of many additions at various dates, the nucleus being the tower with wings north and south, of the latter part of the fourteenth century or early fifteenth century.

The tower has been called a "Pele" tower, and it is unnecessary to discuss here whether the term means an isolated tower or a small fortress. We all understand the type, period and characteristics of a building so designated, and in this case we have a fine and interesting example, interesting because though generally associated with military purposes it is here combined and put to ecclesiastical purposes, and thus indicates the importance and influence in civil affairs of the chief ecclesiastic of Carlisle at the period, or the dangers he was exposed to from friends across the Border. The tower does not stand square with the points of the compass; one side is parallel with and abuts on the western ramparts of the city, and for distinction and reference I will call this the west face, though not quite correct, and the front of the abbey grounds the east face. The outside dimensions are 34 feet from east to west and 32 feet from north to south, comparing very nearly with the towers of Yanwath and Hutton John in Dr. Taylor's list of manorial halls, being larger than the Strickland tower at Rose Castle, and being sixth largest in respect of total width. The west wall is 7 feet thick, the north and south walls 6 feet and the east wall 5 feet. On the west face, not quite in the centre, is a flat projection 11 feet wide and 1 foot 3 inches from face of wall, forming the base of the fine corbelled rectangular bay window of the solar or Prior's room. A similar base on east face is only 9 feet wide and 1 foot projection. That the tower always had buildings abutting on the north and south side is proved by the original label moulds for high-pitched roofs on these faces, and the position of the door and window openings, the former indicating that originally only the buildings to the north communicated with the tower. The tower consists of three storeys, and is 42 feet high to top of battlements. The original entrance was on the ground floor in the north wall, about 10 feet from the east angle; the jambs remain and indicate an opening 3 feet 6 inches wide in the clear. They are not checked or rebated for a door, but have a double splay, confirming the existence of contemporary buildings on this side of the tower. The head of the opening must have been square. No trace remains, but there is not sufficient height for an arch, and this confirms the late date of the tower; the earlier ones usually have arched doors. This opening leads into a vestibule 3 feet 9 inches square in the thickness of the north wall, having on the right hand or west side a door giving access to a straight mural stair in the thickness of the north wall. The opening on the inner face of the wall giving access to the ground floor has been much mutilated, and its form or outline cannot be made out, but no doubt it was the original entrance to the vault or crypt forming the basement or bottom storey of the tower. This apartment is 22 feet 6 inches east to west and 20 feet north to south. It has a very fine ribbed segmental vault, spanning from east to west, consisting of five double-splayed ribs 12½ inches deep and 10½ inches wide, spaced about 2 feet apart, and two wall ribs. The height at the springing is 3 feet 6 inches and at the crown 8 feet 3 inches.

The whole is of very fine masonry and similar in character to the magnificent ribs in the vault of the Captain's Lodging at Bamburgh Castle and also to the Dacre Tower at Naworth Castle. This vault was originally lighted by a single loop at the east end of the south side, where is now the door giving access to the kitchen wing, the only remains of it being in the head of this inserted door. That it was outside the external wall of buildings on the south side is proved by the roof lines. The two loops on the east side were no doubt inserted when the building on this side was connected to the Prior's apartments by Dean Smith at the end of the seventeenth century, or earlier in the sixteenth century at the change in the foundation by Henry VIII., and the original loop converted into a door. The four loops in the west wall are modern, and were inserted twenty years ago when certain division walls were removed and the apartment restored to its original size. There is no indication of any other opening into this apartment on this floor. The stair to the solar or first floor, mentioned before, is 3 feet 2 inches wide, and the steps are not in original position, but were moved by Dean Smith further west. Originally access was gained to the rooms in the building to the north of the tower, exactly the reverse of the present landing, by an opening which remains but is boarded up, near the top of the mural stair, which continued up, turning the north-west angle, and the solar was entered through a mural chamber now cut down and converted into a closet.

Entering the solar, we have a very fine room about 22 feet by 20 feet, with a recessed window of three lights 6 feet deep in the west and a two-light 4 feet deep in the east wall. Both have fine-ribbed rear arches the full thickness of the recesses. The heads of the lights have five cusps. The ceiling of this apartment is the original oak one, with two moulded main beams running north and south and moulded joists between, and the whole was magnificently decorated by Prior Senhouse in the beginning of the sixteenth century. On the south side of the room is a fine redstone open fireplace, 6 feet 9½ inches wide, with a flat jointed head. The jambs and head are finely moulded with bold round and hollow and casement mould on the outer edge of the jambs; the shelf is modern. The room was panelled in the seventeenth century, probably by Dean Smith, but the panelling over the fireplace has been removed, and the wall-surface shows a fine ashlar walling with a relieving arch over the lintel of the fireplace. Turning now to the buildings on the south side of the tower, we have a block extending south for a distance of about 42 feet to the present kitchen fireplace. This is a fine old wall 6 feet thick, but of later date than the building on the other side. The stone mantels are modern or have been renewed, but on the east side of the fireplace is a curious arch and doorway with remains of a locker and loop in the thickness of the wall, and is to my mind the ancient entrance to this kitchen from the conventual buildings, and earlier than any connections to the tower. The buildings on this side of the tower must have been originally narrower than the hall on the north side, and had no connection on the ground floor, the present access from the crypt being, as mentioned before, of Dean Smith's date, and the same may be said of the opening for the connection on each floor.

The Court Leet Rolls of Carlisle have the following item, which seems to indicate that Dean Smith was not quite up to date with the then sanitary authority:—"We present do'tes Thos. Smith deane of Carlisle for his dung hill in the highwaye under ye wall of ye city and we amercye him vi.s. viii.d." The old garde robes were on this west side of the tower. There are remains of old walls beyond the buildings I have described, both north and south. It seems to me that originally the purely domestic apartments of the Prior were confined to the tower and buildings to the north. This would give him no kitchen, but under the rule of the Augustinian Order he would use the common refectory. Then when King Henry VIII. converted the cathedral body from regular to secular, the Prior, now Dean, required a kitchen and suitable offices, and at once opened out communication with the old kitchen of the priory on the south of the tower. This corresponds fairly with the date from the evidences in the building. The Chancellor says the chapter dined in common. As to the door from the mural chamber on the first floor of the tower, if this is earlier than the seventeenth century it only seems to confirm the Prior lived in common with the brethren of the Order, and that it was his private access to the refectory and conventual buildings. I have endeavoured to read you the history of the Deanery from its walls, and perhaps our President will now take up and compare and correct my reading in his kindly way from documentary history. The history I have read to you speaks well for our clergy, who for over 400 years have, out of their own pockets, maintained and improved buildings, in which they only possess a life interest, without stint, and Dean Ridgeway is at once following in the steps of his twenty-nine predecessors, and to bring up the Deanery to the go-ahead date of Carlisle has installed the electric light and restored the panelling in the Prior's room to its pristine state, for in burning off the nineteenth-century oak graining the original painting was found to have been white.

The Next Ordinary General Meeting of the Society of Architects will be held on April 26 at 8 P.M., when a paper on "Shakespeare and Old London" will be read by Mr. T. R. Croger.

NOTES AND COMMENTS.

To-morrow (Saturday) M. Rodin's large figure, *Le Penseur*, will be unveiled in Paris. It stands within the railings in front of the Panthéon. The work was acquired by public subscription, and has been presented to the State. The figure of a nude man who appears to be puzzled could be set up in any part of the revolutionary city with more or less appropriateness. Changes have occurred, and it is easy to imagine a thinker asking himself what advantages have followed. But the Panthéon has an especial fitness for such a figure. The site was occupied by an abbey church dedicated to Sainte Geneviève. It was arranged to erect a new church, and in 1764 Louis XV. laid the first stone. Soufflot was the architect. But the building was hardly completed when the Revolution burst forth, and one of the first acts of the Assembly was to decree that the church should be for the future regarded as a Panthéon which would serve as a memorial of Frenchmen, and the inscription was placed on the front, "Aux Grands Hommes la Patrie Reconnaissante." After the revolutionaries and the Empire had passed away another inscription was set up, announcing that Louis XVIII. had restored the building as a place of worship. In 1830 it again became the Panthéon. In 1851 it was restored to ecclesiastical use, and under the present Republic it is once more a Panthéon. Not many buildings have been subjected to similar alternations, and the aspect of the interior still suggests the dual purposes it has served. The wall-paintings recall the history of Sainte Geneviève, St. Denis, St. Louis, Joan of Arc, while the pendentives of the dome have paintings which recall the deeds of the first Napoleon. There are a few memorials of citizens, but the building itself is more impressive than anything in it. We may imagine the *Penseur* is asking himself why architecture should dominate all other arts.

With the exception of the two cathedrals and parts of one or two churches, Dublin has nothing to show which would suggest the character of its Mediæval buildings. It has long been known, however, that a portion of the ancient abbey of St. Mary still existed. Mary Street, which recalls the buildings, is in a part of the city closely covered with houses, and, of course, overcrowded. The alterations which have taken place in a warehouse quite recently have demonstrated that the part of the abbey which has survived is of greater archæological importance than had been imagined. It is, indeed, supposed that nearly the whole of the chapter-house still remains. It is divided horizontally into two parts, which are used mainly as stores. But although the relic is of exceeding interest, it is difficult to know how it can be preserved. The purchase of the chapter-house is out of the question. All that is feasible is to bring it under the operation of the Irish Monuments Act, and to give it in charge of the Commissioners of Public Works. But for that purpose it would be necessary to obtain a surrender on the part of the owners, and that is not to be expected with business premises, which although ancient are still useful.

We know from Cæsar that the Britons in his time possessed horses and were able to employ them with skill to draw the war chariots. It may be assumed horses were used in Ireland about the same time. The early laws recognise a distinction between horses used in agriculture and those for riding. Recently a crannog in the county of Antrim was explored by Messrs. Knowles and Coffey, and they found in it animal remains, including the skull of a horse, which is declared to be the finest in Europe. Dr. Scharff says it is of an Oriental type, and belonged to an animal about twelve hands high. The horses which we see in the Parthenon frieze are of small stature, and those of the Normans in the Bayeux tapestry are likewise small. Richard Doyle, when he caricatured that Norman work at a time when there was a talk of a new invasion of England, represented some of the French soldiers carrying their steeds under their arms with comparative ease. The Antrim crannog also yielded implements of flint and stone, a very fine iron sword, some bronze brooches and pins, some beautifully ornamented leather shoes.

The first volume has appeared, through Messrs. Constable & Co., Ltd., of "The Deinhardt-Schlomann Series of Technical Dictionaries in Six Languages." Business is now becoming of a more international character than formerly, and, as most students are aware, the best ordinary dictionaries ignore the technical terms which relate to the details of machinery, plants, metallurgy, building, &c. The first volume relates to the machine-elements and tools for working in metal and wood. The plan adopted is excellent; a vast number of small diagrams are introduced in order that the reader may have no doubt about the tool or detail which is described in the letterpress. This will obviate errors in descriptions or orders. The different sections will be prepared by specialists, and hence it is the terms which are of use in workshops, but which are unknown to lexicographers, find a place. The languages employed are English, German, French, Italian, Spanish and Russian, and the volumes are prepared in a handy form.

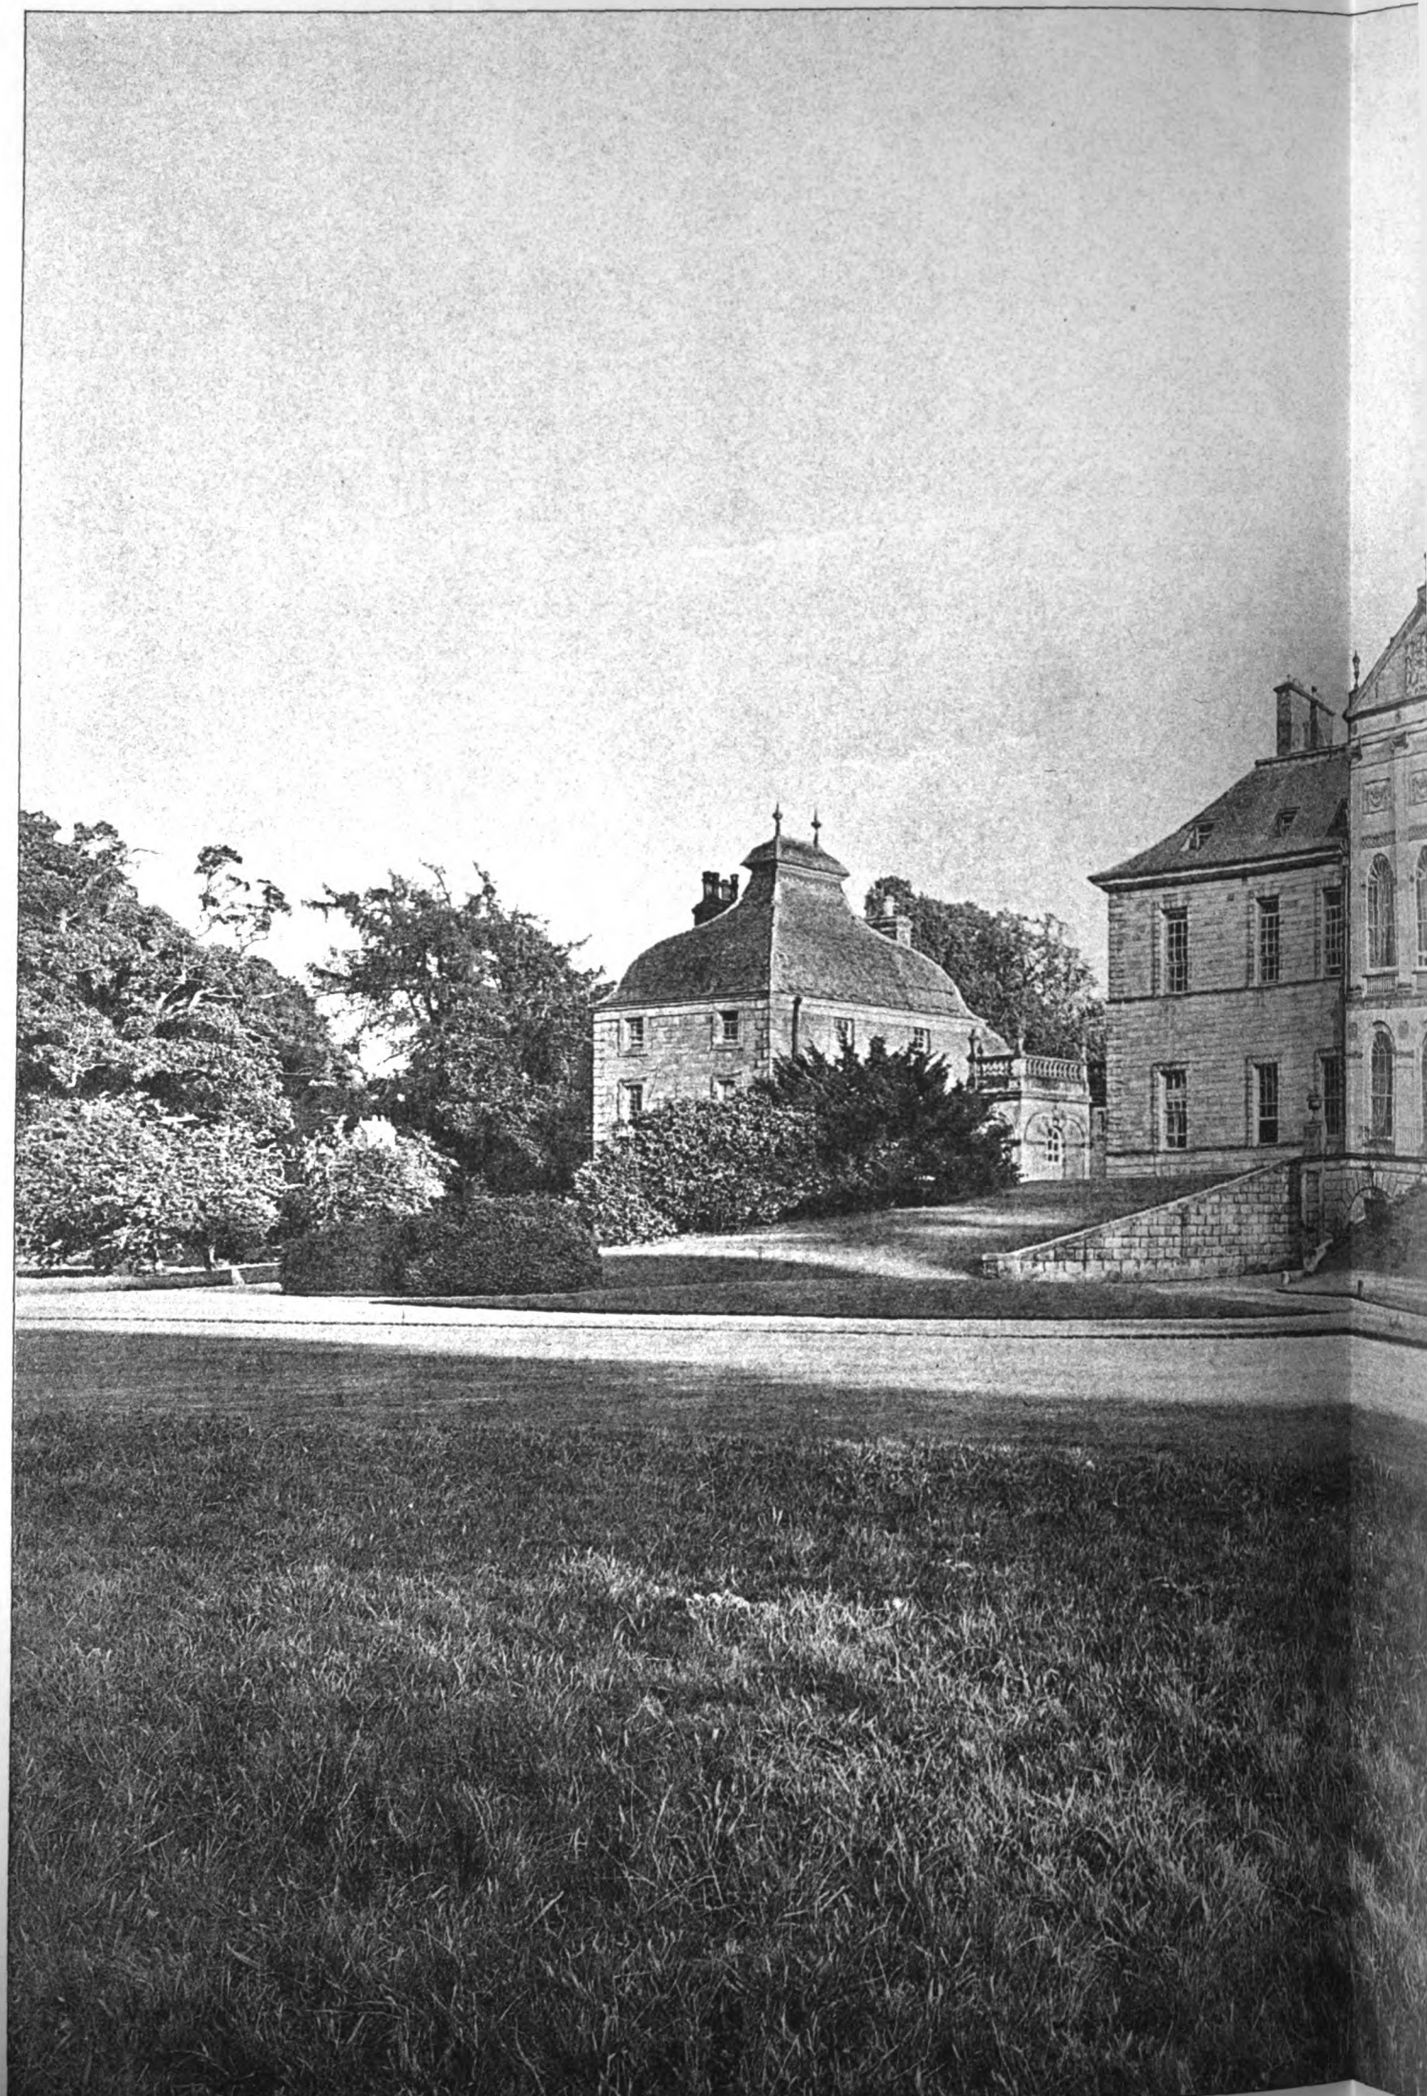
HANOVER HOUSE, ST. JOHN'S WOOD, N.W.

WOOLWICH TOWN HALL: INTERIOR OF THE COUNCIL CHAMBER.



This chamber is designed in the form of a Greek cross, the dome at the crossing being carried on four main vaults spanning the arms of the cross. The interior of the dome is enriched with modelled plaster-work, and the panelling and furnishing of the room are in wainscot oak. The members' seats range round the room in the form of a half-circle. The public are accommodated in a raised gallery following the curved line of the seating, the upper panels of the gallery front being enriched with oak carving of different designs, strengthening the main architectural line which emphasises the radiating form of the seating. The room is entered through two doors leading from the great entrance hall, between which is the dais on which the mayor presides at the meetings of the Council. On this dais is placed the mayor's table and chair, with the town clerk's seat and the deputy mayor's seat on either side. The fitting-up of this room is an exhibition of craftsmanship in its highest form, the oak carving of the gallery front, the members' benches, and particularly the mayor's chair, being of an excellence that will repay examination. The room is lighted by stained-glass windows on three sides, the centre one showing the present Royal Arms, the other two representing the great Tudor sovereigns, Henry VIII. and Elizabeth, under whom Woolwich assumed its first importance as the mother dock of England. Bluff King Hal is depicted in characteristic attitude with his famous ship the *Harry Grace à Dieu*, commonly called the *Great Harry*, in a medallion to the left, the inscription on which reads as follows:—"The *Great Harry* was built at Woolwich in 1512, and conveyed King Henry VIII. to the Field of the Cloth of Gold. She was burnt here by negligence and lack of foresight in 1553." The side medallions of the Queen Elizabeth window have in like manner a representation of her ship the *Elizabeth*, and the inscription here reads:—"The *Elizabeth* was launched at Woolwich on July 3, 1559, in the presence of Queen Elizabeth. Was afterwards commanded by Sir Robert Southwell against the Armada." The architect is Mr. A. Brumwell Thomas.

WINCHESTER CATHEDRAL.

THE following is the report on the repairs to March 25, 1906:—

14 Buckingham Street, Strand, London, W.C.

To the Very Rev. the Dean of Winchester.

Dear Mr. Dean,—I send, as I promised, a report on the work done up to the present date to the south and north sides and the east end of the south aisle of Bishop de Lucy's building.

Shoring—Bonding.

In August last I gave instructions for shoring the greater part of the south side, and for bonding across the cracks in that wall with long blocks of hard Yorkshire stone. These were well bonded and grouted with the Greathead machine which we have been able to borrow through the kindness of Mr. Fox, the civil engineer.

Tie-rods.

This has now been done effectually from the ground level up to the gallery passage that pierces the wall at the window level. The repair below awaits the underpinning, and that above the insertion of the iron ties. These are now ordered and are being made; the walls and piers are nearly all pierced for the passage of the ties, and I hope before the end of April they will be all fixed and grouted in and tightly screwed up. When this is done I propose to complete the repair of the upper parts of this wall, and also of the corresponding north wall, which proves to be cracked almost as badly as the south. When these side walls are made solid by the bonding of the cracks and the cross ties of steel rods, we shall be better able to deal with the underpinning.

The Chantries.

In order to put proper protecting casings over the Beaufort and Waynflete chantries I have been obliged to remove their top pinnacles, which will be taken care of till the time comes for replacing them. I may mention that they were nearly all quite loose, and, so far as I have observed, they appear all to be of modern work.

The Vaulting of North Aisle.

On February 26 last alarm was caused by the fall of one of the ashlar filling-in stones of the north aisle vault near the Waynflete chantry. The published reports exaggerated the accident, but, though not in itself so serious as was represented, it was symptomatic of a dangerous state of that vault in many places. The scaffolding which has since been erected affords a closer view of the vault and reveals serious defects. Part of it will need taking out and resetting, and the whole will require grouting and pinning up. I have, in consequence of this accident, stopped the piercing of the north wall, as the fall of this stone was caused, no doubt, by the jarring of this operation, which might have brought more of the vaulting down after it. I am now having the vault in this bay thoroughly centred, and have put shoring to the north wall like that on the south side. As soon as this is complete the iron ties will be inserted and the bonding of the cracks completed on this side like the other.

South Aisle Vault.

The vault of the south aisle is also now being centred and prepared for resetting the dangerous parts, much of which is really only held up by being bolted to timbering in the roof space above.

Underpinning in Crypt of Lady Chapel.

In starting the underpinning, I decided, while exploring the foundation of the main walls, to begin with the vaulting under the lady chapel, which had been well propped with centring. In my first report I gave it as my opinion that the mischief was due to the sinking of the central pillar. On removing this, after securing the superstructure by a collar round the capital supported on shores, I found my supposition was correct. A large square stone on which the column stood was broken and tilted up at the corners, and below was the head of a 15-inch timber pile which was so rotten that it could be cut with a spade like cheese. This column is now rebuilt on a new foundation of cement, concrete and brick about 16 feet deep, resting on the solid gravel. The whole of the groining of this crypt was grouted with cement and pointed, and the centring is now removed. The second column is now being collared and shored in order to be treated like the first.

Underpinning of Main Walls.

In my first report I mentioned that in the trial hole under the south wall made at my first visit the end of a timber projected from under the foundation, and I suggested this might be part of a layer of baulks or rough trees laid continuously. Further exploration proves that this is the case.

Timber in Foundation.

The whole of this part of the building seems to stand on two layers of trees laid across one another in a mass of loose chalk; many of these are quite soft and decayed, but others are still sound. The builders seem to have gone down with their foundation to the water level, and then, not knowing how to deal with the difficulty, to have done the best they could with this timber layer. Had this, as was done in some similar instances, been made a good deal wider than the walls, so as to increase the supporting area, it might have been effectual. As it is the whole has been crushed down into the soft ground overlying the peat, and the result is the settlements now troubling us.

Eastward Slip of the Church.

The nature of the foundation is worse the further it goes eastward. The ground there seems to have been a bog, for there is a layer of peat 5 feet thick above the gravel bed, which is the first hard bottom. In consequence the whole building has slipped eastwards, parting at the great cracks which are now exposed in the side walls.

Underpinning now in Progress at the East End.

I therefore decided, after conferring with you and the chapter in November last, to begin the underpinning at the east end of the building—that is, with the east wall of Bishop Langton's chapel. By putting in a very solid foundation there, resting on the hard gravel bed, I proposed to arrest this tendency to slip eastwards, and having done that, to work from this fixed base along the south wall westwards till the whole of this side of the church rested on the firm gravel bed some 29 feet below the floor of the presbytery, 21 feet below ground and 14 feet below the present level of the water.

Water Difficulty.

It was not, however, till the layer of peat was pierced that we tapped the water, which was sealed down by this impervious layer. On breaking through this, however, we found the water rushed up from the gravel bed below to the height I have mentioned, which is no doubt that of the river. It was extremely difficult to know how to put in 12 feet of building below the old foundations under these conditions; as at first I did not venture on pumping, to the danger of which I was, of course, fully alive. An attempt to dredge out the peat under water from below these thick walls was quite unsuccessful. Finally, observing that the water came entirely from below the peat out of the clean gravel, and that it was as clear as crystal, I tried pumping experimentally. The danger of pumping of course consists in the removal of sand and soil, which allows subsidence of the stratum, and as nothing of this sort came away with the water I was reassured. Hand pumping was quite unable to cope with the inrush, and our first piece of underpinning was not so successful as I had desired. A steam pump has therefore been purchased, which is powerful enough to reduce the depth of water in our drifts to 2 feet. The peat is then scooped out, cement concrete in bags laid on the gravel, above which day by day fresh layers of cement concrete are laid, and finally the old foundation is underpinned with brickwork in cement. When it is remembered that the whole of this work has to be done below the natural water level it may be understood that the task is no easy one. About two-thirds of the east wall of Bishop Langton's chapel has already been successfully underpinned with cement, concrete and brickwork resting on the solid gravel, affording a good support to this end wall. The rest is in progress, and when this end is made secure we shall work from it along the side wall westward, when the difficulty will not be so serious.

I fear it will be necessary to treat the north side of the building in the same way, but the gravel will, I believe, be found at a much less depth from the surface. As some public apprehension was excited by reports of what was being done, I asked Mr. Francis Fox, the civil engineer, whose opinion is probably as good as any you could possibly obtain, to visit the cathedral with me and report to you what he thought of the methods that had been adopted. This he has been kind enough to do, and he is sending you a separate report. I need not say how much I am indebted to him for the trouble he has so kindly taken, and for the advice and help he has afforded me. It is a relief to my

Digitized by Google

mind to find that he generally agrees with the methods that I have pursued, and is hopeful as to the result.

I am, dear Mr. Dean, yours very truly,

Thos. G. Jackson, R.A.

P.S.—As a statement has been made that fresh cracks have appeared in the walls since pumping has been in use, I may add that no movement whatever in the walls has been observed.

Supplementary Report.

April 7, 1906.

Dear Mr. Dean,—From my last report you will have learnt that the greater part of the east end of the south presbytery aisle and Bishop Langton's chapel had been successfully underpinned from the solid gravel bed 21 feet below ground, and I described the method which had been employed.

The next piece of underpinning involved fresh difficulties, as we found a thin layer of chalky matter overlying the gravel between it and the peat. As this would have been drawn by the pumping, I stopped the pump at once. To get over this new difficulty I gladly adopted the suggestion of Mr. Fox to employ divers. By his means I have been able to engage the services of two men who have had experience in laying foundations of bridges under water, and yesterday they finished taking out the peat and laying the first stratum of our new foundation under water. This will seal down the spring, and the surface water can be dealt with by the pump and the foundation completed by the ordinary workmen. To avoid delay which might be dangerous I have arranged for the work to go on during the Easter holidays.

The divers have left and will return at intervals as each piece of underpinning is ready for them. We have now, I hope, solved all the constructive problems that have hitherto made our work rather experimental, and we shall now be able to make more rapid progress.—Yours very truly,

T. G. Jackson.

ROYAL GLASGOW INSTITUTE.

THE architectural drawings are placed this year in the entrance corridor, not a bad situation, says the *Glasgow Herald*, so far as light is concerned, and one that insures notice from every visitor. At the same time, it is a little ominous; the enlarged premises are apparently proving inadequate, and the drawings are the first to feel the pressure. One is glad to note, however, that the ousting from the upper gallery is not to make room for pictures, but for an unusually large collection of sculpture.

The architectural exhibit is rather mediocre. It is not even very representative of local men—for some of the foremost show nothing—and only a few Edinburgh and English architects contribute, while in importance not one of the examples is of first rank in merit or magnitude. A full half are shown by photographs; of the remainder two-thirds are pen-and-ink drawings in perspective, the others are in colour or monochrome wash.

There is a fair show of ecclesiastical work. One of the most important examples is the fine church of "St. James, Kilmalcolm," by Mr. Leiper. It is a Gothic design, illustrated by two photos of the exterior—where the chief feature is the tower, an agreeable variant on the ordinary steeple—and four interior views, showing stonewalling and columns, with wood finishings in keeping. With this may be compared Mr. Cullen's "Dundyvan Church, Coatbridge," an ink drawing, with stone piers but plastered walls, of orthodox three-aisled plan, with transepts, the aisles being used for passages only. Note may be taken of the arrangement for the choir, who are placed in a gallery alongside of the organ, which faces the chancel, but has this choir space behind as well, thus avoiding an objectionable recess or chamber. Mr. Cullen also sends a pen drawing of a church at Motherwell, "St. Andrew's," showing a tower with saddle-back roof of Scottish type. A large interior, a pen-and-ink drawing of the "Catholic Apostolic Church," Parliamentary Road, by Messrs. Salmon, Son & Gillespie, does not make obvious what is the new extension, which, presumably, is the north aisle. Pen drawings of "Bridgeton Baptist Church," by Messrs. Miller & Black, of "Ruchill U.F.," by Mr. Neil Duff, and photographs of a most attractive small "Wesleyan Church, Girvan," by Messrs. Watson & Salmond, are in a late phase of the Gothic style favoured by all the examples exhibited. "Iona Cathedral," a pen drawing by Messrs. Honeyman, Keppie & Macintosh, is a tiny structure; the view shows the nave walls carried up and a roof added; the west window is new.

The largest drawing is in pen and ink, one of a competitive set, by Miss Campbell Douglas and A. N. Paterson, for a "London Hospital." The view given does not so well illustrate the wards as the large administrative and dispensary blocks. The chief architectural feature is the water towers, of brick. Our own new "Maternity Hospital," by Mr. Robert A. Brydon, has no plan to explain the arrangement, and externally is quite uninteresting. One of our Board schools—Scotland Street—by Messrs. Honeyman, Keppie & Macintosh, is distinctly away from the commonplace. Two flanking round towers make up a good composition, and window space is abundant. A key plan would have shown how the towers were utilised. Other schools, happily less original, are "Dalmuir," by Mr. Andrews, and "Bowling," by Messrs. Stewart & Paterson.

Of city street architecture, about the only example is the "British Linen Bank," Queen Street, by Messrs. Salmon, Son & Gillespie. Photographs show how very happily a couple of storeys have been added, to the distinct improvement of the building. Another bank is in Kent, a coloured drawing by Mr. Ernest Newton, in brick, with oriels partly lead covered. It is a very characteristic specimen of this architect's ability. New Metropolitan Offices for the "Scottish Temperance Assurance," by Mr. Fred Rowntree, has a curved façade—in plan—and there is moderation in the shopman's claim for glass. By the same hand is a house at Reigate, in brick, very homelike and attractive. Both are pen drawings. "The Wesleyan Methodist Halls," Paisley, a pen drawing by Messrs. Watson & Salmond, has to contend with shop-front difficulty. The longer façade, that includes the hall proper, is free. The design is dignified and effective.

The "Institute of Public Health, Edinburgh University," a wash drawing by Messrs. Leadbetter & Fairley, is good; and by the same architects, "Carlung," a clever enlargement of a mansion, is in excellent taste. A "City Hall Front" (Perth?), an ink drawing by Messrs. Walker & Ramsay, has twin towers, whose upper parts rather suggest bandstands. "Dunoon Pavilion," a pen drawing by Mr. Wm. Fraser, has a quite appropriate treatment, being gay with balconies, towers and flag-poles. An illuminated pencil-sketch design for a like building at Ayr is by Messrs. Baptie, Bonn & H. Hamilton Scott. Designs for lending libraries at various places are shown, whether only intended or actual is not stated Strangely enough, only one of over three-score competitive designs for our Mitchell is shown, namely, that by Mr. H. K. Bromhead. The amended design that is to be built one might have expected to see. The "Hotel at Arrochar," by A. N. Paterson, with rough-cast walls, is finely situated on the loch side, and the photo makes a beautiful picture. Houses at "Winchfield" and "Wokingham" in ink and in colour, by Ernest Newton, are both excellent, if the first does err in over-simplicity—*e.g.* only a trellis at the doorway. "Red Tower, Helensburgh," by Mr. Leiper, is a large mansion and a characteristic example of the architect's work. It is illustrated by six photographs. Mr. T. W. Deas shows "Kinfauns Castle: the Staircase," with some quaint carvings in oak. Credit is given on the frame of photographs to the several craftsmen employed. Mr. Deas has also a small "House at Corstorphine," rather interesting. A photo of a nice plaster overmantel is by Mr. Morris. Sketches or drawings of interiors sometimes show apartments to more advantage than do photographs. This is seen in the slightly-tinted sketches of a house in "Hatfield Drive," by Messrs. Stewart & Paterson, and in the "Drawing-room, Jerviston," by Mr. Cullen, jun. "Redholme," the house of Sir John Ure Primrose, Messrs. Burnet, Boston & Carruther, is illustrated by a set of photographs. Two good coloured drawings of a "House at Troon" show rough-cast walls with some interesting work at doorways. "Dansky," Mr. James K. Hunter, is a photo of a large mansion even more completely rough-cast than the preceding. Photos, too, show the handsome gateway and lodge to Tulliallan Castle, richly treated in seventeenth-century Scottish fashion by Messrs. Watson & Salmond. A design for a Victoria monument, a wash drawing by F. E. Schenck, in general form an obelisk with figures at three stages, is of considerable merit, though the pediments overhang the lowest group rather threateningly. There are various fairly good designs for stained glass by Edgar and Hall and Bryson. Messrs. Guthrie in their sketches show nice colouring, as do also Messrs. Stephen Adam & Webster. Another is the "Hall Window," M'Lellan & Co. It is rather more of a transparency than a glass window, and is shown in rather dull colouring.

HORIZONTAL CURVES IN AMERICAN BUILDINGS.

By W. H. GOODYEAR.

AS the construction of the great flight of steps in front of the central portico of the Brooklyn Museum begins to rise above the earth's surface, it may be observed by careful inspection that the steps are built in delicate curves rising from each end toward the centre. The use of such a refinement is so unusual in modern architecture as to call for a mention of other known instances.

Mr. C. H. Blackall, of Boston, was apparently the first American architect to employ this device of horizontal curves, which occur on a warehouse in Purchase Street, Boston, in a long stone belt which is immediately over a row of columns in the first storey. In the construction of Tremont Temple in Boston horizontal curves were planned by the same architect, but the façade was in terra-cotta, and the expense of bevelling the separate pieces to form the line of curve caused the abandonment of the plan.

Curves similar to those seen in front of the Brooklyn Museum portico have been employed in the steps leading up to the front portico of the Library of Columbia University, and also in the front platform of University Hall, in Columbia University. Both these buildings were designed by Messrs. McKim, Mead & White, who are the architects of the Brooklyn Museum.

Aside from the Albright Art Gallery in Buffalo, which is reported to have introduced the Greek refinements, it is doubtful that any other instances can be offered of the use of horizontal curves in modern architecture, and all of the instances quoted are well understood to be incipient revivals or imitations of an ancient Greek practice. This practice was forgotten in later times, and at the opening of the nineteenth century it was wholly unknown to modern students that it ever existed. It was rediscovered by an English architect, Mr. John Pennethorne, who not only discovered the curves in site, as found in the Parthenon at Athens, but also called attention to a passage in an ancient Roman authority on architecture (Vitruvius) which laid down rules for the construction of such curves. Vitruvius had been studied for 300 years before the time of Mr. Pennethorne, but no one had previously realised the significance of the given passage or had taken the trouble to test its truth by an examination of the original buildings.

At the present time the facts are well admitted, but the explanations are by no means so well understood by the world at large. There is a general and wide-spread impression that the Greek curves were intended to produce the appearance of straight lines by correcting an optical effect of sagging downward, which is supposed by this explanation to be a general effect in long horizontal lines. Such a suggestion regarding the sagging effect as peculiar to all horizontal lines has never been offered by the authorities on optics who have published accounts of the Greek curves. Nor has it ever been offered by any of the authorities who have published investigations of the original buildings. The statement appears to originate in a misapprehension of what certain writers have said as to a sagging effect of certain horizontal lines under certain peculiar conditions, and even these explanations have been shown to be unsatisfactory and inconclusive explanations of the Greek curves.

The true explanation is undoubtedly that which is offered by the highest and most recent American authority on the subject, "The Dictionary of Architecture," edited by Dr. Russell Sturgis, and published by Macmillan. The article on Refinements in Design, written by Mr. G. L. Heins, the official architect for the State of New York, says:—"If, however, we can give a satisfactory reason why a column should have an entasis, that same reason will suffice to account for all the other refinements as yet known to exist, at least in Classical work. The only satisfactory explanation of them is that the entasis (vertical curves in the columns) and other such refinements were introduced from artistic preference, from delight in the abstract beauty which results in their use."

For several reasons the curves employed in the steps of the Brooklyn Museum building have no very close relation to those of Greek architecture. There is no known example of ancient Greek curves excepting in the temples, and here they always occur in the entablature (that is, in the upper horizontal lines) as well as in the steps and platforms. Moreover, the curves of the platform are not confined to the exterior platform, but they belong to a system of construction by which the entire platform of the building, including the interior, was built in the shape of a very flat spherical surface. An extremely important point is that the curves were only one of many refinements, all of which appear to have had equal importance, although the curves have been more frequently mentioned and quoted by modern writers because the modern imagination seems to have been especially impressed by them. Moreover, the erroneous but plausible explanation that the curves were intended to make the lines look straight has had great attraction for the modern public, which naturally thinks that the lines ought to be straight, and which consequently thinks it can comprehend an effort to make them look so. The other refinements, of equal importance with the curves, all start from the one principle that every detail of a Greek temple was delicately asymmetric. Thus the columns and capitals are all of delicately irregular sizes, the spacings and other apparently corresponding measurements are all delicately varied and irregular. The apparently perpendicular lines are all delicately out of perpendicular. None of these variations are consciously perceived by the eye, but they all contribute to its enjoyment and pleasure by adding an element of life, which is possibly physiologically due to optical vibration, but which is, at all events, akin to the sentiment which leads us to prefer Oriental rugs and hand-made lace to the products of machinery. The sentiment which prefers originals to copies in all classes of materials is a closely related and probably identical feeling.

In spite of the vast gulf which thus separates the modern incipient revival of Greek curves from those of the original buildings, which belong to a larger complex of related facts, they have great interest as indicating an interest in architectural refinements which must in time prove of considerable value to modern art appreciation. The asymmetric refinements of Mediæval architecture are in some cases more easily revived than those of the Greeks, as attested by the façade of a new hotel on the Lido at Venice by the architect Sardi, which does not differ in its external character and appearance from an ordinary modern building, excepting in the fact that its surfaces and openings of doors and windows are out of exact symmetry, but for that very reason really more utilitarian. The entire country house and villa architecture of the United States has in recent years shown similar tendencies. The truest independence is always nearest to the truest art, and exactly where copies of ancient buildings are not in question it is most likely that their true spirit will be most nearly revived.

RHIND LECTURES.

THE last of the series of Rhind Lectures on "Roman Britain" was given by Dr. F. Haverfield, of Christ Church, Oxford, in Edinburgh on the 10th inst. The lecturer dealt specially with the study of Roman Britain, attention being directed mainly to the antiquaries of the twelfth century and of the sixteenth, to the period of Horsley, to the archæological uprising about 1848, and to the condition of the study at present. The study of Roman Britain, the lecturer said, embraced four periods, the first of which was the Norman Conquest. The period which opened in 1120 continued with slight alterations of knowledge and interest all through the Middle Ages, and the second period began with the Renaissance, with its revival of states of all sorts. In speaking of this period the lecturer pointed out that the true Watling Street ran across England, corresponding exactly with the Roman Road from London to the neighbourhood of Shrewsbury, and possibly from there a little further on. There was another Watling Street, starting from York through Durham, and which, somewhere in Durham or Northumberland, obtained that name. It crossed the Cheviots and passed close to Jedburgh and Melrose, and then proceeded across country to Inveresk and Cramond. Deer Street was the proper name; that Watling Street was a modern invention was quite certain. In the third period, which dated from the commencement of the eighteenth century, specialisation began to appear, and the idea took firm root that it was possible and desirable to deal with Roman Britain as a subject of its own. That period went on for about 100 years, and a distinct advance was made towards the fourth period—that which immediately succeeded the Reform Bill. It had been left to a few societies and museums to keep alive the scientific and continuous study of the subject. Otherwise, he was afraid, archæology had become a mere form of picnicking. Universities probably, if they had the money, and many

Digitized by Google

had, could do a good deal in respect to the training of men and making them competent to excavate; and the training, it seemed to him, might frequently be carried out actually on the field of excavation. On the motion of Dr. Christison, the lecturer was cordially thanked. The course, Dr. Christison said, had been both interesting and instructive, and not only had Dr. Haverfield shown himself a master of his subject but a master of the art of delivery.

THE PALACES OF THE JAMESES.

TO those at a loss to know how best to spend a short holiday I strongly recommend, says a correspondent of the *Scotsman*, a tour through the palaces of the Jameses Everybody who has the opportunity visits the French castles on the Loire, and a rich reward they get in beauty and historic interest; but why should those who do not have that opportunity not make a tour through the beautiful palaces at their own door?

The fabric of our palaces may not be so rich architecturally as their French counterparts, but we have at least the advantage of knowing their history better and feeling in them the pride of ownership. We may visit each separately as occasion offers and examine it in detail, but the pleasure produced by a connected tour with these palaces as our stopping-places is something quite different.

To get into the proper frame of mind for the thorough enjoyment of such a tour we, in Edinburgh, cannot do better than begin by climbing the ramparts of the castle and looking at the well-known view before us. What we see is peculiarly the Jameses' Scotland. Down to the right lies Holyrood; the splendid estuary before us winds up to Stirling, while midway between is Linlithgow. Over there, among the Fife woods and cornfields, are Dunfermline and Falkland, and we know that behind those far-away hills we shall find Perth. Touraine cannot furnish a vantage-point like it, and the valley of the Loire knows no such scenery. It matters not which James built which palace. They were all built or added to by one or other of them. James after James was born in one or other of these palaces, and spent his eventful life between them, imprisoned here, escaping there, hunting and hearkening to music in one, marrying and holding high revel in another, deliberating gravely on affairs of State in a third. Only their deaths are not associated with them, for the Jameses were not given to dying in their beds. Of all the five in the direct line, and their daughter Mary, only one died at Falkland a natural death, if dying of a broken heart may be so called. Was ever such a record in any country?

The time of the great sieges and captures was over before the Jameses came to Edinburgh Castle, but a story from their time haunts the memory there. It is the story of the banquet given to the Douglases by the Chancellor and governor of the young King James II., which terminated by the introduction of the fatal bull's head. One can hear in imagination the "plaints cryes and teares" of the young king when the terrible sentence presaged by the horrible dish was carried out on the Douglases and their faithful friend. Would that, grown older, he had remembered his childish tears and cries, and stayed his hand when another Douglas, trusting to his honour, stood within his power in Stirling Castle. He would have spared the greatest blot on his short and chivalrous career. The memories called up by existing Holyrood are also deeds of violence. Holyrood has suffered almost more than any of the Stuart palaces. The royal dead who sleep in the abbey church were powerless to check the fire or stay the hand of the destroyer. Gone is every vestige of the great monastic house which so often entertained kingly guests, of the banqueting-hall where James II. held his wondrous wedding feast, and of the chambers "hang'd of red and of blue" which James IV. furnished for his English bride. All that remains is the setting of the tragedy of Rizzio, and that deed of horror can be only too easily conjured up on the spot.

We are quite glad to be out on the road to Linlithgow, passing in imagination through the forest of Drumsheugh, meeting perhaps a jovial hunting party, or a group of nobles hotly riding with a young king in their midst, whom they had wrested from a rival group, who as hotly pursue behind. These wrestings of the young king by one faction from another were not infrequent, as most of the Stuart reigns began with a minority, and many a stern chase has been led over the roads connecting the castles. Poor passive James III. was but as a pawn in a game. Persuaded by a Boyd to break away from a hunt while at Linlithgow, he was turned back by a Kennedy, recaptured by a Boyd and hurried to Edinburgh. But James V. was made of sterner stuff, and took his destiny into his own hands when he broke away from Falkland in the disguise of a groom and rode hard to Stirling, attended only by Jockie Hart and one other boy. Round Linlithgow less sinister memories cling; with Falkland it was reserved as the pleasure house of the Stuarts, the setting of their courtly amusements. It has one attraction peculiar to itself in the loch that laps its walls. On it gay barge-loads of "lords and ladies gay" must often have floated, and the song of the minstrel and the strains of the lute been wafted over its waters. There James IV. and Margaret Drummond wiled away pleasant hours in each other's society, before jealousy doomed her to death and State necessity devised a more brilliant alliance for him. In Linlithgow his son, the fruit of the union of the Thistle and the Rose, was born, and it became the dower-house of the widowed Margaret Tudor after the disaster of Flodden. It is the little James V. that haunts us at Linlithgow. We hear his childish voice pleading, "Pa, Da Lyn," and see the tiny figure of the baby king trotting after his knightly tutor, the great Sir David Lyndsay, of the Mount. It was from Linlithgow that the news was borne to him on his death-bed at Falkland of the birth of the baby girl who was to succeed him. We who live in times when our kings see their grandchildren, sometimes their great grandchildren, should surely give much sympathy to the royal race who never saw a son grow to man's estate and judge their actions very tenderly, remembering how they came to their throne as fatherless infants.

The blood must surely have mantled in many a Stuart cheek as they rode from Linlithgow to Stirling, memories of Falkirk, Stirling Bridge, and, above all, Bannockburn, being called up by the scenes they passed; and if anything was needed to embitter the feelings of poor James III. after his defeat at Sauchieburn, it must have been that it took place under the eye of Stirling and within sight of Bannockburn. He must have been glad to lie quiet in Cambuskenneth by the Forth, although he owed his release to the assassin's knife and not to an honourable death in battle. From Stirling there is a splendid view back over the plain of the Forth that has been traversed. Northwards just across the river are the Ochils, a barrier that must be rounded. Steep and bracken-covered on this side, they are smooth and sloping and green on the other, and the valley at their base cannot have changed much since the Jameses' days. Houses are few, for the farms are large, and the loneliness is great. On the right lies the Sheriffmuir, associated with the defeat of the hopes of a James Stuart of a later generation, on the left the solitary Carsebreck where Highlands and Lowlands still contend, but only for victory in the "roaring game." Here we meet the phantom of a stricken queen flying with her infant son from Perth, where the murder of her dearly-loved husband had just taken place. This murder caused Perth to be shunned as a royal residence, as it was not considered capable of protecting the person of a king. When times were quieter James IV. and James V. returned to be crowned at Scone, but externally absolutely nothing now remains of the old Palace. For the sake of James I., however, who was crowned at Scone and murdered in the monastery of the Blackfriars, we must still visit Perth, and indeed the view from the height of Windyedge is worth many times the journey. Scott now tempts us to abandon the river for the road, at least till the "dark and huge tower" of Falkland, where Rothesay met his death, shall come into view. There is no dark tower now, however, as during the Jameses' time it gave place to a fair palace; and, by sticking to the road, we shall have the pleasure of chasing that poor poltroon James VI. when, in for once very well-founded terror, he fled from the Gowrie House in Perth back to the safe shelter of Falkland. Falkland was another of the homes where the Stuarts loved to throw aside the cares of State and indulge in the sports and amusements in which they were so well fitted to shine. Surrounded by forest it afforded splendid hunting, while indoors Blind Harry sang of his hero Wallace to the race who owed so much to him, and there were not wanting courtly chroniclers to celebrate in verse the "lusty life" of their own day. Even the hard-pressed Mary, we are told, sometimes escaped "to play the country girl in the parks and woods of Falkland."

There only remains Dunfermline, the last of the royal palaces, and unique in one way as connecting the Stuart race through Malcolm Canmore with the old kings who sleep in Iona, who knew not any of the fair lowland palaces

Digitized by Google

of their later descendants. The remains of the palace of Dunfermline and the adjoining ecclesiastical buildings are full of suggestion and interest. One could spend long hours in one of the deep windows of the Great Hall trying to reconstruct the ancient buildings or dreaming of the days when

> The King sate in Dunfermline tower
> Drinking the blude-red wine;

so evening best suits the mood for quitting it. On the way down to Queensferry we may pause at St. Margaret's Stone, and dwell for a little on the tender, pathetic figure of the fugitive Saxon princess, whose marriage with Malcolm Canmore at Dunfermline wrought such changes in Scotland. Further on we shall meet the Lords of the Congregation hurrying hot-foot to Stirling, who nevertheless paused by the way to "kest doun the abbey of Dunfermline." So we pass on to the Queen's Ferry, whence we arrive again by road under the shadow of the castle, more proud of our country because knowing it better, cherishing more our history because we have realised the actors in it, loving more our royal house because we have felt the pathos of abandoned homes, have been haunted by the echoes of laughter stilled, have been moved by the memory of grief endured. We have had a bit from the heart of Scotland and the heart of her history, and I commend it to all as a precious experience.

SOUTH KENSINGTON MUSEUM.

THE South Kensington Museum has recently purchased a pair of candlesticks of cast-brass of the seventeenth century, decorated with floral designs on a black-and-white ground. They have very large circular plates between the stems and the bases, which seem to have been a characteristic feature of the period. There are two plain candlesticks of brass of this type in the museum, and in the Kremlin at Moscow there is a very large specimen in hammered silver-gilt bearing the English hall-mark for 1663-4. These candlesticks are exhibited with the other English enamelled objects in the Prince Consort's Gallery.

In two of the cases opposite the Leighton fresco of the Arts of Peace is a small collection of drawings in black-and-white by G. J. Pinwell and J. W. North, A.R.A.; they were prepared for the most part to illustrate the "Poems by Jean Ingelow," published by Messrs. Longmans in 1867. With them is shown a very interesting pen and pencil drawing by T. White of Pinwell himself at work; it is dated 1862. In an adjoining case are some woodblocks upon which F. Walker, G. Du Maurier, Miss Edwards, Linley Sambourne and H. Furniss have drawn, but which have in some cases never been engraved. No print from the large cut block by Pinwell was ever published. Five cases near the door of the Art Library contain a large collection of illustrated printed books on architecture, chiefly of the sixteenth century.

In the Architectural Court is the recently-acquired cast of the bronze monument of Archbishop Ernst of Magdeburg (1464-1513), executed by Peter Vischer in 1497, six years before the prelate's death. Some important additions have been made to the collections of architectural details in carved stone through the generosity of Mr. J. H. Fitzhenry, who has presented four examples of French origin dating from the time of Francis I. (1515-47). They are exhibited at the north-west corner of the North Court. The most striking of them is a complete dormer window, standing some 20 feet high, from the Château de Montal, a ruined manor-house situated on the high ground overlooking Saint Céré, in the Department of Lot. This château was built for Jehane de Balsac, dame de Montal, and was begun in 1523; it is thus contemporaneous with the better-known edifices at Blois and Chambord.

It was from one of these dormer windows that, as the story goes, Rose de Montal, forsaken by her lover, Roger de Castelnau, flung herself with the cry "Plus d'espoir," a motto which is engraved on the pediment of the window now in the museum. The sculptured ornament includes a beautiful frieze of scrolls, demi-figures and amorini disposed symmetrically on either side of a central cartouche; on the pediment besides the inscription are two projecting busts and the figure of a headless warrior holding his skull in his hand. The arms of Montal and Balsac are carved below. Next to it is the upper part of a similar dormer window, evidently dating from the same period, as the crowned salamander in flames which forms so striking a piece of ornament on this pediment was a favourite device of Francis I. Below is placed a portion of an arch-soffit, from the Château de Bonnivat, situated some twenty miles from Poitiers, and built by Guillaume de Gouffier, Amiral de Bonnivat, a favourite of the same king. The fourth example is a canopy for a statuette formerly in the church of St. Etienne du Mont at Paris. It is composed of delicate Renaissance work, betraying in its disposition traces of the Gothic style which even at that period were still apparent in French architecture. It is enriched with beautifully modelled figures, scrolls and shields of arms. Replicas of these shields may still be seen on the tall columns and brackets at the back of the high altar of St. Etienne.

ARCHITECT, SCULPTOR AND PAINTER.*

I AM to have the honour of speaking this evening for the mural painters, and it seems to me that the solidarity of the triumvirate of architect, sculptor and painter is just now to us the most important subject in the world. Divided they do not fall, the three arts, that is true; alone each would make a good showing, but united they stand for the greatest collectivity of beauty which man has produced. Follow the whole course of history and you will find no buildings of importance, save the Pyramids of Egypt, which have not been greatly enhanced in beauty, celebrity and influence for good by the fact that sculptor and painter have followed in the train of the architect.

The architect comes first; he is the leader. Even in prehistoric times he fortified the cave mouth and wattled the hut before his younger brothers carved profiles of bear or deer on bone or daubed them in red clay on the rocks. And later with that development which in the dictionary definition marks the difference between building and architecture, the architect must determine the proportion of wall, window and door before sculptor or painter can be useful. Then the architect is leader, but close behind *him* come his aids. The temple of the arts is builded by three minds acting in unison, and the keystone to the structure is harmony, harmony of thought and feeling between architect, painter and sculptor.

It is upon this above all else that we, the representatives of the allied arts, must insist if we would be successful. Harmony should be our slogan. The very word decoration tells us so, tells us that once in its place our work must be decorous, suitable, fitting. If it is not enhancing to them and enhanced by them, no matter how fine it is as an individual work, it is a failure from the true point of view, because it comes to jar, not to consolidate, the effect. Therefore, and because if we ignore each other we may harm each other, we must study each other, make allowance for each other, enough allowance, and what is perhaps nearly as important, not too much.

If ever a situation required one to light the lamp of sacrifice it is that of architect, sculptor and painter confronted mutually by the same problem; but, on the other hand, if the sacrifice of personality is entire, the lamp is quite snuffed out, and there is no more light at all.

The painter or sculptor who proceeds in contempt of his architect is a bull in a china shop, to be led outside as soon as possible and turned loose in the pastures suited to untamable personalities. But the architect will be as bad if he turns Procrustes and lops off the feet or heads of his collaborators till their stature just fits the size of his idea. Mutual concession will lead to mutual comprehension and pave the way to mutual education. We shall never be really in harmony till each learns something of the other's specialty and realises that quite apart from temperament and genius in the producer there are reasons for beauty, reasons which can be studied and understood. To-day we feel our lack of knowledge of each other and are a bit irritated by it. Says the painter, the architect has no decorative sense; says some one else, the sculptor has no sense of scale. As for the architect's estimate (too true perhaps) of the painter's knowledge of architecture, it reminds one of the dialogue in the novel of the "Heavenly Twins" between the tourist and the bad boy of the story.

"Flying buttresses," says the tourist, looking down into his guide book and up at the cathedral, "what are flying buttresses?" "Flying buttresses," said the boy smoothly, "flying buttresses are a sign of rain." We mural painters really do know a little more than the tourist, but there's lots

* A paper by Mr. Edwin H. Blashfield, read before the New York Architectural League.

Digitized by Google

of room in us for more knowledge. More all-round education for painter, sculptor and architect is what we want, for it is only by our harmony and mutual comprehension that all sound education of the public, which is so crucial to our success, can be attained. We are willing to begin with educating ourselves, we mural painters. We are young in art; our work, save the splendid example in the Ascension Church in New York (still the most beautiful mural painting in America, not excepting the Puvis de Chavannes), was born but a dozen years ago at the World's Fair. We are coming of age now; a rather callow age as yet, you say, but if we recognise onr callowness we shall mature. Our art is a difficult one, each problem is a new problem, our men and women have grown from the little people of the easel pictures to more than lifesize, and they are harder to manage. The cleverly brushed square inches of the sketch have expanded to square yards; the portrait of the easel-painter must be taught to carry 60 feet at least; on our big canvases we must combat unexpected reflections and inequalities of lighting. We ask the architects to credit us with all these difficulties, and on the other hand, we must admit their right to ask sacrifices of us. A painter has no business to sit in his studio and, formulating his scheme, be it ever so good, ask the architect to fit that scheme to his architecture. Such a painter would be exactly like the artist who, being commissioned to paint a tavern sign with a white horse on it, said he would rather paint a red lion. "But I want a white horse." "Oh, but the red lion would be handsomer." "Yes, but I want a white horse and won't have anything else." "Oh, well, if you are so obstinate, I'll paint you a white horse, but it will look like a red lion."

There are architects who reasonably fear in some cases that the white horse ordered may look like a red lion, and to do away with such fears the mural painter should earnestly study beforehand the place which he is to decorate.

Before ending I want to say a word about the subject of decorations. We have a wonderful field before us—new cities awaiting our hand. Do not let us forget that it is an American field, that it is an American field suited to the celebration of what Americans have been in the past, what they are now and what they hope for in the future.

We do not wish to have processions of pale abstractions only upon our walls, goddesses of Liberty and Justice and such; we want processions also of workmen with their tools, real men and women of all sorts and conditions. It is good to see the historical subjects coming, good to see the facts. But in proceeding thus as patriotic Americans let us also proceed heedfully, looking carefully at all sides of our question.

Let us remember that to the American the apprehension of fact is perhaps easier than the cultivation of fancy; let us therefore not neglect the latter. I would deprecate with all possible earnestness the opinion of those who would wish us to substitute realistic for what they call idealistic or allegorical subjects. We don't want to substitute one for the other; we want to have both, and we want them very much.

Fine spun allegory is a nuisance, the refuge of the uninveutive, but simple symbolism is good and essential, because without it we cannot have large treatment of the nude and simple draperies, and without such treatment no rounded national art is possible.

Throughout the history of painting during thousands of years, save in Holland, wherever and whenever the nude has been neglected, just so surely the art of that school has either ceased to be all round in character or has ceased to be robust. The different branches of painting are equally great, whether portrait, landscape, historic or symbolic, but a national school does not consist of any three or four branches, but of all of them taken together. Symbolical painting of the nude and large draperies is essential to us. Say if you will that we have not yet the capacity to treat it with the strength and splendour due to it, but admit also that we shall not learn to swim by avoiding the water. We paint with oil upon canvas just as the Venetians did; their works have lasted 400 years. We must learn to paint pictures whose potentiality for material endurance need not terrify. Such learning must be based upon study of the nude in the size of life.

Therefore, we need and should have what is commonly called idealistic painting and sculpture. My whole subject to-night has been the mutual education of architect, sculptor and painter.

This will compel expenditure of thought, time and money, but the result should be worth the effort.

Our opportunity is almost boundless. We have an empire for our client, and for our themes the conquest of a continent by the arts of peace, the events of four wars, exploration, invention and evolution. There is plenty of capacity in the American, and with perfected mutual education we shall be equal to the celebration of all this. We shall become so gradually, for we recognise our difficulties.

It is for such recognition and improvement that we are teaching in the schools, founding university departments at home and American academies abroad. We are trying to help the coming generation to a better equipment than was ever provided to us.

Help toward such a happening is in a way better and bigger than any picture which we can paint, statue which we can model, building which we can raise, and if the man grown too old for work sees such a future coming, he may put down compass or chisel or palette without bitterness and say with a good heart, "Finis coronat opus."

TESSERÆ.

Greek Influence in India.

IT seems that we have been too apt to attribute everything in India with a classical savour to the conquests of Alexander, forgetting how faint and fleeting were the traces left by the remotest of his escapades. His Indian venture was abortive and fruitless; in fact, as Foucher points out, the retreat from the Punjab probably resembled a subsequent retreat from Moscow. Moreover, art rarely breaks its native bounds in the period of efflorescence. As a rule, it is only when the vital force is spent or on the wane that the last results of effort and experiment can be exported for imitation in definite forms. Leonardo died in France, but it was Primaticcio—*quantum mutatis*—who founded a school there Anyhow, it was to the *pax Romana* far more than to the adventures of "Macedonia's madman" that Hellenic art owed its possibility of expansion. What we should have guessed antecedently is confirmed on examination of the forms themselves. The influence at work is not pure Greek, but Græco-Roman; and, on the whole, Senart is probably right in assigning the bulk of what we call Græco-Buddhist sculpture to the first two centuries of our era.

Decoration of Basilicas.

The basilica builders had no sort of intention of challenging critics in their exteriors. They contemplated art in their interiors only. This was by a system of decorative incrustation. Mosaic of small dice or cubes of coloured marbles had been extensively used, chiefly for pavements, but also for roofs, by the old empire in later days. The incrustation of walls with larger and more magnificent veneers of marble was also common. The scale on which the imperial baths and palaces were built necessitated the use of the more cheap and procurable material of brick, and the taste for importing rare and splendid marbles could only satisfy itself by covering with them these vast protected interior surfaces. This system therefore became, in the hands of the rich and luxurious Romans, the most sumptuous source of architectural decoration. It was at the same time a system distinct from that of the structure itself. The latter was crusted over and concealed as by a coat, the forms and lines of which had no necessary connection with the mass beneath or behind it. These slabs of marble were usually made to cover the walls up to a given height, 15 to 25 feet, after which occurs generally a string or cornice holding them and binding them into the wall, while it marks the division between the marbles and the mosaic decorations, which, being in small dice, could assume the character of pictorial representation. The sculpture on these buildings is usually executed in white marble, the shafts of columns being of various colours and monoliths. There are two characters of sculpture in basilicas, the first being a simple imitation of the debased Roman work of the period, and usually executed to supply parts that were not to be obtained by ransacking the ruins of the city. The second period of sculpture, viz. all that executed in Ravenna, Constantinople or elsewhere, where no older work was at hand, has a character of its own—sharp, severely controlled, but not wanting in vigour or grace. Constantinople and Ravenna furnish the most elegant and characteristic work of this kind. In this sculpture natural forms and the appreciation of natural vegetation begin to reappear. For some ages the Easterns seem to be ahead of the West in these respects; the East therefore will form the best field for study for details of

Digitized by Google

these works. The state of artistic design was undoubtedly at its lowest when these basilicas began to be erected as churches. Their historical designs are rude and conventional. The old Greek sense of beauty had died out in Rome. Luxury and vulgarity had gradually destroyed the manliness of the race, and such sense and love of beauty as it had possessed in days of vigour and prosperity. Constantine could find few competent artists either to sculpture his triumphal arch or to decorate his new capital. Still, the Christian community had carried down with it into its subterranean oratories and chapels certain traditions of former times. Historical representations, even sometimes under mythological types, as that of Orpheus, are habitual to those interesting monuments. The Classic tunic, and occasionally the nude figure, continued to be represented in their paintings. We shall find as basilica building and decoration progressed a marked difference between the simplicity of accessories of dress and ornament in the West, in contrast with the elaboration of colour and detail in the East. The basilicas of Justinian at Ravenna are interesting examples of this Byzantine spirit; they represent in more than one instance the emperor and his court, or his empress and hers, with details of costume carefully followed. But though these designs were rude and showed ignorance of form, they were by no means wanting in grandeur. Quite the contrary. That nerve and vigour of character which luxury had eaten out of the Italian character was beginning to grow anew from fresh sources, and Christianity really inaugurated the revival of the arts. That revival was slow and conducted through most stormy ages of calamity, but a genuine revival it was.

Stone, Bronze and Iron Ages.

The effect of prejudice in diminishing the power of critical judgment in man is really remarkable. The Neo-German School having decided in their own minds that all great discoveries, both abstract and practical, belong chiefly to the Germanic branch of the Indo-European race, of course the discovery of metals must have been made by them, and was, therefore, carried into their new settlement in Scandinavia. What if the German Nomades were ignorant of iron, and only learned its use in Scandinavia or on their way thither? Yet such is, very probably, the case. The idea that three successive races occupied the north and north-west of Europe, the first of whom used only weapons of stone, the second bronze weapons, the third, being acquainted with iron, originated in Denmark—in an excellent little guide to the ethnological archæology of North Europe, published by the Society of Northern Antiquarians of Copenhagen, this hypothesis is stated, as it ought to be, with caution and reserve, and merely as a probability. Some of the members of that body have not imitated this good and scientific example; among others, Mr. Worsaae, looks upon the hypothesis as an expression of facts. Another and more recent writer of the same school is Mr. Axal. Em. Holmberg, who has published a popular exposition of the ancient condition of Scandinavia, in which the first part is devoted to (1) the Stone Age; (2) the Bronze Age; (3) the Iron Age, &c. That weapons composed of the three kinds of materials mentioned are found in tumuli, not only in Scandinavia, but also in Ireland and elsewhere in North Europe, is true; and this is just the whole amount of truth in the hypothesis—the three successive races, each in a distinct state of cultivation, being an interesting creation of imaginative archæology, which has found favour not only in the country of its birth, but in England, Scotland, and we may also add, Ireland.

Bernini, the Sculptor.

Bernini was the originator of a new manner, the founder of a numerous school, whose sway extended over the whole of Europe, and continued down to the middle of the last century. The talents of this artist were great, vigorous and prolific, but his taste was as remarkably extravagant. Destitute of the creative power which reveals itself in the production of new combinations, his ill-regulated efforts after originality were unhappily directed to the style of art which in the very midst of the master-works of antiquity he misapprehended and debased in an inconceivable manner, as though he would annihilate all truth and beauty in art and leave it entirely at the mercy of the most unbridled fancy. In truth, extravagance of taste could scarcely be carried further in sculpture than in the works of Bernini and his school. Bones of exaggerated size, muscles swollen into mountains, in his men; soft, bloated flesh, voluptuous forms, surpassing even Rubens, in his women; ill-formed, scrofulous children; draperies to be compared only to the waves of a stormy sea suddenly turned into stone; distorted features, frantic faces, wildly dishevelled hair and beard, attitudes in violent contrast, the gestures of insanity, impetuous movements without aim or reason, and a treatment of the marble giving it by high polish an almost gelatinous softness, are the chief beauties of that style which in its day enchanted the amateur and connoisseur, and inundated France and Italy during a whole century with its deformities. But it was not sculpture alone that was thus misused, a similar corruption of taste prevailed like an epidemic in all the other departments of art. Marino and his followers in poetry, Lanfranco and Pietro da Cortona in painting, Borromini in architecture, were all guilty of like extravagance; but the enormities of Bernini were the greatest—most repulsive. Strictly speaking, this hateful manner had been transferred to sculpture from painting, and Algardi had already laid the foundation of it, but in his hands it was kept within bounds. Bernini alone had the hardihood to introduce into sculpture the license which Lanfranco and Pietro da Cortona permitted themselves in their ceilings and cupolas.

Charles V. at Yuste.

When the Emperor Charles V. decided on his abdication and had selected the monastery of the Order of St. Jerome at Yuste as his retreat, he sent officials to examine the site. Afterwards he sketched a plan himself of the rooms he required for his accommodation. They were described as "hardly sufficient for a private gentleman—four out of the six rooms in the form of friars' cells, with naked walls and all on a level with the ground." Although the additional wing had neither golden gate nor Temple of Esculapius, as at Spalato, the elevation partook more of a cheerful Italian villa than a Spanish convent. The building was superintended by Antonio Villacastin, who afterwards, as surveyor of the works of the Escurial, saw the first stone laid of that gigantic pile and its completion; there he lies buried like our Wren, and also aged ninety-one, in his own St. Paul's, the best monument of his fame. The wing consisted of two storeys, each containing four rooms, connected by sunny galleries outside and well-warmed inside by fireplaces, such as the chilly Charles everywhere introduced into his Spanish residences, even in the Alcazar of sun-roasted Seville and the Alhambra of sun-toasted Granada, to the merciless destruction of exquisite Moorish diapery and surface-wall decoration. The emperor inhabited the upper storey; an opening was made, which enabled him when confined to his bed to see the high altar and the celebration of Mass in the chapel: his cabinet looked southward; the garden below it easily reached by an inclined plane and arranged in a succession of terraces down to the stream. The front of the monastery was shaded by a magnificent walnut-tree, even then called *el nogal grande*—"a Nestor of the woods, which has seen the hermit's cell rise to a royal convent and sink into ruin, and has survived the Spanish order of St. Jerome and the Austrian dynasty." The rooms were furnished to his peculiar simple tastes and hung with plain cloth instead of the usual costly arras, of which, however, he had enough to tapestry the whole building. His supply of quilts and fine linen was greater still; whilst his friends were seated on velvet chairs he himself reposed on one with wheels, six soft cushions and a footstool. Of gold and silver plate he had 13,000 ounces. Charles, who always had been plain to parsimony in his dress, did not turn dandy in the cloister; his jewels consisted chiefly of badges of the Golden Fleece, one of which is said, incorrectly, to have been worn by our Great Duke.

Carpets in Europe.

It is a doubtful point as to whether carpets proper were made in Europe before the seventeenth century, although some archæologists think that the "tapisseries Saracenois" mentioned in the edicts of Louis IX.'s time were true-piled carpetwork, and it must be said that their reasoning seems rather convincing. Anyhow, there is no direct evidence of carpet-making in Mediæval Europe, where, as a matter of course, foot carpets would be little used in the rough and very out-of-door life then led. But from the middle of the fifteenth century there is abundant evidence of the importation of Eastern carpets into Europe, the most direct and satisfactory of which is given us by the pictures of the period, in which such goods are often shown. These show us carpets doubtless made in Asia Minor, of geometrical designs always, the prototypes of which were obviously floor mosaics; both the Flemish painters and the Italian paint these things with much accuracy and enjoyment. But besides these carpets, there was undoubtedly another kind of design being carried out at the time, whose headquarters

Digitized by Google

was Ispahan, in Persia. This kind of design was elaborate, flowing and founded on floral forms, very commonly mingled with animals and sometimes with human figures. In short, the geometrically-designed carpets have a direct analogy with the earlier Byzantine silk stuffs as to design.

Correspondence

Nuneaton Priory.

Sir,—I have, since writing to you, found brief mention in the thin one-vol. "Dugdale" and in "Stevens" (practically identical) of Nuneaton Priory. It belonged to the category of greater priories, but no list of priors is given. "Dugdale," i. 516, is the reference in "Stevens," but there are not that number of pages in vol. i. of the edition of 1718, to which he refers. The continuation of the "Monasticon" often finds fault with "Dugdale," so the eight-vol. edition, though itself not faultless at times, was my best authority, and its not having given Nuneaton may be taken to be my excuse for not coming upon it before. I have now entered it on my list of greater priories.—Yours faithfully,

John A. Randolph.

GENERAL.

Professor Thiersch, of the Munich Technical High School, has been elected honorary member of the local Academy of Fine Arts. He is an architect.

Mr. R. T. Moynan, R.H.A., the Irish painter, died last week. He studied in Antwerp and Paris, as well as in Dublin. The subjects he preferred were poor children.

The Belfast Garden Estates Co. will hold an exhibition of houses on their Cliftonville Estate, Belfast, in November. The sum of 700*l.* will be expended in prizes. The awards will be made by the assessor, Mr. Maurice B. Adams.

The Partnership between William Thomas Lockwood and Philip Henry Lockwood (trading as T. M. Lockwood & Sons), Foregate Street, Chester, architects, has been dissolved.

The Holborn Borough Council have agreed that the architect whose designs for the new town hall should be selected will have the carrying out of the work.

The Cleethorpes Town Committee have decided to invite young artists to submit designs suitable for a poster advertising the town. A prize of five guineas is offered to the competitor forwarding the best design.

Mr. Percy Monckton will be a candidate for the vacancy in the Court of Common Council caused by the death of Mr. Deputy White. Mr. Monckton is a member of the firm of Monckton & Gillespie, architects.

The Holborn Borough Council were informed by the law and parliamentary committee that, according to the opinion of counsel, the Council could not legally grant a superannuation allowance to Mr. George Wallace (late borough surveyor).

The Edinburgh Architectural Association at their meeting on Wednesday adopted the motion of Mr. Henry Kerr, by which Mr. G. S. Aitken will receive the full privileges of Fellowship of the Association. Mr. Aitken was the first president.

In the Competition for free library buildings at Bangor, out of the 117 designs submitted, Mr. P. C. Thicknesse, the assessor, awarded the first prize of 25*l.* to Mr. Albert E. Dixon, of the firm of Dixon & Potter, King Street, Manchester, the second prize being awarded to Mr. Vernon Hodge, 13 Grand Parade, Teddington.

The Glasgow Corporation will charge a fee for the right of reproducing the works of art in the museums and galleries.

The Late Mr. William Gibbs Bartleet, of Kirkdale, New Beckenham, Kent (of the firm of Messrs. W. G. Bartleet & Son, architects and surveyors, of 56 New Broad Street, London, E.C.), has left property valued at 86,015*l.*

The Annual General Meeting of the Manchester Society of Architects will be held on the 26th inst.

Mr. Thos. Moody, F.S.I., has removed his offices to No. 2 Haymarket, S.W., the premises Nos. 29 and 30 Cockspur Street having been acquired by the Cunard Steamship Company for their new building site.

Our Valued Contributor, Dr. William Searle Holdsworth, D.C.L., lecturer in jurisprudence at St. John's and Wadham Colleges, Oxford, and professor of constitutional law at University College, London, has been elected to an official fellowship at St. John's College.

The County Road Board of Sutherland last week discussed a motion to appoint a civil engineer and surveyor, in succession to the late Mr. John Baxter, C.E., and an amendment that the candidate selected need not be a civil engineer. Eventually it was agreed to declare the situation open at a salary of 250*l.*, with 50*l.* for travelling expenses and the engineering work of the Council, the only stipulation being that besides being able to attend to the roads, the person appointed should be able to prepare plans of bridges, waterworks, &c., and see the work carried through.

The North Wall of Crowland Abbey, in South Lincolnshire, having buckled, it will be necessary to underpin it immediately if further damage to the old monastery is to be prevented. The rector, the Rev. T. H. Le Bœuf, states that since 1884, when he was appointed, he has written 17,410 letters asking for help to restore the abbey. His labours have broken down his health. Mr. Le Bœuf says his desire is simply to restore the remains of this once famous mitred monastery, the history of which goes back to A.D. 672.

M. Rodin, the French sculptor, received from the Glasgow University the honorary degree of LL.D. on the 18th inst. When intimation of this was made a short time since the Council of the Scottish Arts Club, Edinburgh, wrote M. Rodin inviting him also to visit Edinburgh, and offering him a banquet in recognition of his distinguished services to art and as a souvenir of his visit to Scotland. In a letter addressed to the secretary of the club, M. Rodin regrets his inability to visit Scotland at present, so that the degree on Wednesday had to be conferred *in absentia*. He says:—"I feel deeply sensible and grateful of the honour you have done me in offering to entertain me at a banquet. Unfortunately, I am so fatigued that I can't think of undertaking so long a journey at present. It is a great regret to me not to be able to shake hands with my Scottish friends, to whom I send the warmest expressions of my regard. I have not given up the idea of coming, some time, to Scotland—far from it."

Sir Rowand Anderson has submitted his report to the Governors of George Heriot's Trust with regard to the architectural, trade and art classes in the Heriot-Watt College, Edinburgh. In one place he states:—"Edinburgh cannot support and does not require more than one first-class school, and all the work done by the above schools could, and should, be concentrated in one school, under a high-class director and organiser, who should be a permanent official with a more highly paid staff of teachers, who should be engaged for a term of years only, say five. While I advocate the concentration of art teaching in one central art school, the Heriot-Watt College and all other technical schools must still carry on drawing classes, as any engineer or man of science cannot be considered completely educated unless he is a good draughtsman."

The Hereford Town Council, in consequence of a memorial from local architects asking them to forbid their officials, their assistants and municipal servants from engaging in private business, adopted the following resolution:—"That all persons in the employment of the Corporation whose appointments were based upon the devotion of the whole of their time to the work of the Council, shall not hereafter be allowed to take outside or private work, either in or out of working hours, other than advisory, and then only for local public bodies, when and after application shall have been made to this Council by such local public body, and such application shall have been granted by this Council in private meeting."

The Coventry City Council were informed by the general works committee that they had selected a design for proposed municipal offices and shops in St. Mary Street and Earl Street for submission to the Council on the 24th inst., and had made arrangements for the designs to be inspected for a week by members of the Council. A councillor pointed out that an important decision upon plans involving large expenditure had been arrived at without expert advice, and this he thought highly inadvisable. The committee, it appeared, had the matter referred to them with direct instructions to select a plan, and this was what they had done. An amendment that the minutes be referred back was defeated. It is expected that the total cost of the scheme may be about 91,000*l.*

The Architect.

THE WEEK.

The destruction of San Francisco is likely to have some effect on the deliberations about the Panama Canal. By one scheme it would be necessary to have immense locks. In fact, they would surpass any already existing. But it is now believed that such structures would be shattered if there were any earth movements. If locks are not adopted expensive cuttings would become necessary, and the canal would have a diminished breadth and depth. In the latter case the traffic would be restricted to the use of vessels of less draught than is desirable. Some of the delay in constructing the canal must be ascribed to the number of the proposals which have been brought forward. It may be assumed that the number will be largely increased, for inventors have a fascination in providing against tellurian forces.

There was a discussion on Monday by the Portsmouth Town Council over a proposal that it was expedient for the Council to acquire the undertaking of the South Pier Company, Ltd. In the end thirty-four members voted for the project and only one against it. The South Parade Pier was partially destroyed by fire a couple of years ago. From time to time the owners have endeavoured to raise the money which would be necessary to restore the structure, but without success. Plans were prepared, but the financial difficulty was not to be overcome. The pier in its present state, with a license, the plans and other documents, can be acquired for 10,750*l.* To that sum will have to be added the cost of reconstruction, which will amount at least to 35,000*l.* It is, however, assumed that it will be necessary to obtain an Act to authorise the sale, and that the outlay will be 50,000*l.*, or with a floating swimming-bath the amount may reach 60,000*l.* Portsmouth is subjected to military control, and it is considered doubtful whether the authorities would allow the construction of a new pier at a site nearer to the Castle. Some members of the Council were in favour of an independent pier, but eventually it was decided to take over the property of the company. The debenture holders are to be paid in full, the holders of preference shares two-thirds of the nominal value, and the ordinary shareholders one-half of the nominal value.

The Italian architect Signor Beltrami, having been entrusted with the rearrangement of the Ambrosiana at Milan, has made an important discovery. There was a bust portrait in the gallery which at one time was known as a Duke of Milan, and it was ascribed to Leonardo da Vinci. Others considered it to be a work by his disciple, Luini. Modern scepticism was unfavourable to both designations, and finally the picture was simply regarded as a portrait of an unknown man by some imitator of da Vinci. The picture has been cleaned, and to the amazement of those engaged, a hand became visible which held a roll on which some notes of music were represented. After investigation Signor Beltrami has come to the conclusion that the portrait is one of Franchino Gaffurio, who was born in 1451, and was musical director to Ludovico Moro in Milan. According to Vasari, the great artist had gained renown as a lute player, and characteristically of his inventiveness had constructed an instrument of silver in the form of a horse's head, and his playing on it enchanted the Duke. The cleaning of the picture has further manifested from the treatment of the details that the portrait is a genuine work by the Milanese master.

The Board of Education has issued instructions concerning the design and fittings of secondary schools and pupil teachers' centres. It is declared to be undesirable to lay down any hard-and-fast rules respecting planning. Variations from the principles will be carefully considered, and if it is found that they provide satisfactorily for the requirements of scholars they will be approved. The Board will discuss, if required, schemes for new buildings while in a preliminary stage with the promoters. A classroom is not to be designed for less than fifteen scholars or more than thirty. Every school is to be provided with a gymnasium, a proper dining-hall for day scholars as well as for boarders, and common rooms for masters and scholars for use out of school hours. Libraries and infirmaries are mentioned as essentials to every boarding-school. In boarding-schools for more than eighty boarders it is suggested that there should be separate boarding-houses for not more than fifty in each house under the charge of a master. Playing-fields to the extent of three or four acres should be provided for small schools, increasing proportionately for larger schools, with a paved space for drilling and a covered shed for games on wet days. Before recognising newly-erected premises as suitable for a secondary school the Board must be satisfied, by the submission of plans drawn in accordance with prescribed requirements, that the building regulations are complied with. The promoters must, however, take their own measures to secure that their plans are in order under any by-laws which may be in force in the district in which the school is situated.

Early in the year the Birmingham City Council invited architects to send in sketch plans for an extension of the municipal buildings, which were designed by the late Yeoville Thomason. It was stated that not less than six nor more than ten were to be selected, and that the authors of the designs would each receive an honorarium of 100 guineas upon submitting complete designs in the second and final competition. The plans were to be sent in by March 31. One hundred and twenty-four sets were received, and they were examined by the assessors, Sir Aston Webb, R.A., and Mr. E. Ingress Bell. Each plan was numbered as received, and a similar number was placed upon the envelope containing the author's name. Ten designs were selected. Two are by Birmingham firms, viz. Messrs. Crouch, Butler & R. Savage, and Messrs. Mansell, Mansell & Dixon. One set is from Liverpool, and is by Messrs. Matear & Simon. Seven of the designs are from London offices, viz. Messrs. H. V. Ashley & Winton Newman, Greenaway & Newbery, H. T. Hare, E. P. Howard, A. N. Prentice, Treadwell & Martin, Wills & Anderson. The second competition will now be entered on.

In the history of the steel trade the name of Sir John Brown, of Sheffield, merits prominence. His steel plates for armoured vessels helped to revolutionise the Navy. In the course of a few years his firm were able to produce plates which were 15 inches thick instead of 4½ inches. As became a wealthy manufacturer, he erected a fine house outside Sheffield. Endcliffe Hall stands on an elevated site, and is supposed to have cost more than 100,000*l.* After it was left a tenant could not be found to keep up so costly a property, and in 1895 it had to be sold to a local company for 26,000*l.* It proved convenient for people who wished to give garden parties, receptions and entertainments of various kinds. But the income derived in that way was insufficient, and it now appears that the hall with five acres of land can be obtained for 10,000*l.* Mr. C. B. Flockton, architect, has been endeavouring to form a small limited company in order to purchase the hall and grounds. If it stood in the neighbourhood of London the County Council would lose no time in securing the property. But the Sheffield authorities are less venturous. If the building cannot be utilised it would be better to have it demolished without delay. For a "Folly" of that kind always serves as a warning against the erection of costly residences.

A NEW SAN FRANCISCO.

IF, as the schoolbooks teach and the old Romans believed, the spectacle of a courageous man struggling with misfortune gave pleasure to the gods, what is to be said of the thousands of men who are working bravely in San Francisco with the resolution to reconstruct that city and to make the new capital of the State superior to the old? The history of building presents many examples of energy. Yet the Old World cannot point to one which in sublimity approaches what is now to be witnessed in San Francisco. The deplorable Fire of London which began near Fish Street on September 2, 1665, was only an affair of three or four days, and there was no earthquake to increase the misery. Nevertheless nearly a year was allowed to elapse before any definite steps were taken to rebuild the city. There was so little public spirit shown at the time that London still suffers through the selfishness which then prevailed. It was proposed to select some trustworthy persons who would have made arrangements for leasing or selling building sites according to a definite plan. Private interests, however, conquered, and in consequence, as PEPYS says, "the streets were built by fits, and not entire till all differences be decided." The Americans have more common sense than to imitate English precedents. In San Francisco, moreover, there is the advantage that the lines of streets are mainly laid out at right angles. North of Market Street there is only one thoroughfare that differs from the general direction. South of Market Street the streets are parallel to it, and are intersected at right angles. In the old city of London an arrangement of that kind was unknown. As we can still see from those parts which have survived, the streets seem to have been constructed bit by bit, as if the owners or leaseholders had the sole control of the lines. There is little difficulty in a town laid out like San Francisco and many others in America in following the former lines of the streets with exactitude. The system of planning may not be picturesque, but it meets the requirements of Americans and offers facilities for business. If it is considered desirable to change the direction of streets, that can be done without much trouble, as the rectangular system will be retained. Baltimore, which lately was supposed to present opportunities for improved streets, suggests the readiness of Americans to accommodate themselves to the necessities of the occasion. Where changes of streets were thought to be advisable few obstacles were raised. However, Baltimore was a comparatively ancient city, for it dates from 1729, while San Francisco was of no account before the end of 1849. The land was laid out on principles seldom recognised by the early authorities of Baltimore. and a revival of the lines cannot cause either delay or trouble in San Francisco. It may therefore be assumed that the chief business houses will in the new city be found standing in the positions which they formerly occupied.

Whether the public buildings and the railway stations will retain their old sites is another question. But the authorities will find it an advantage to decide promptly upon their arrangements. There are a great many people who, although they might not be able to plan a simple dwelling-house, consider themselves competent to lay out the largest cities. In England they abound, and are fast becoming a rather perplexing species of humanity. The necessities of San Francisco must be well known. It is a great place for trade which will become greater, especially under the new conditions of business with the East. Commerce apparently will long be paramount in it and must be respected. As happens with Manchester and Liverpool, the city is only used during the day by those who live in the picturesque environs, and that being the case the problem is simplified. San Francisco, which was neglected until gold was discovered near it, and then induced most of the inhabitants to desert the small town, is now one of the great seaports of the world. No other port has more advantages, and it would be absurd of the authorities if they imagined that it might be converted into a show place. If however they can expend ten millions sterling on display, Mr. D. H. BURNHAM last year prepared plans which should serve.

It is impossible in the week which has elapsed since the catastrophe to speak with any certainty about the resistance offered by different building materials. The circumstances were most complicated, for in addition to the terrible force of the earthquake there were fires to an extent which seems to have exceeded experience not only in San Francisco but in other American cities. The accounts of the effects, which were written amidst a tumbling city, could not have the precision desirable when we have to judge either of materials or of construction. In the early years of the city there was an apprehension of earthquakes, and consequently wooden buildings were preferred.

According to the latest accounts the buildings which have most successfully withstood all the strains are the steel-framed structures. This would be satisfactory, if true, for several reasons. In the first place, it would show that theoretical calculations can sometimes correspond with prophecies. San Francisco was about the last of the American cities which favoured frame construction. Not even speculators were free from the fear that sooner or later earthquakes would occur, and tall office buildings would not only cause more fatal results by their downfall, but the financial loss would also be excessive. It required much demonstration of the advantages of steel structures in case of an earthquake before the *Chronicle* buildings and the Croker and Mills Buildings were raised. They were taken as precedents, and in 1897 the nineteen storeys of the Spreckel's Building were constructed with a height of 300 feet. The year afterwards there was undoubtedly an earthquake, and the last building was believed to have swayed. But the breaking-up point was not reached. After such a trial of stability, there could be little force in any objection to the system.

It is, therefore, not improbable that the more important of the high buildings which were erected since 1898 in San Francisco have demonstrated that the system of steel framing is adapted for districts which are liable to extraordinary force. In Japan wooden framing has repeatedly been found to remain when construction of heavier kind succumbed. From the telegraphic messages which have appeared, the general resolve has been to use steel columns and beams in the rebuilding of the city. To facilitate construction, it is said that orders have been sent to this country and to Germany for material. It is also believed that the import duties on rolled steel will not be levied. The Americans have had so much experience in high building construction, they would be able within the year by erecting a number of buildings to completely transform the present confusion. Six months may be considered as the average time required for one of the great office buildings in Chicago and New York. Under pressure still more remarkable rapidity could be displayed. In Europe there will be a general desire, whatever kind of building is adopted, that people who have displayed so much energy in dealing with a calamity will be able to recover themselves and to carry out their work as in the days before the earthquake.

In the earthquake at Lisbon in 1775 it was found that the most solid buildings were the first to fall. Every parish church, convent, nunnery and public edifice was either thrown down or shattered. Both the king and the people were in such despair that a long time must have elapsed before any efforts were made for the removal of the ruins if it were not for the extraordinary energy of POMBAL, the Minister. It now seems mysterious that Pompeii, which at one time was believed to be essential to the existence of well-to-do Romans, was allowed to remain for nearly seventeen hundred years with-

Digitized by Google

out any effort to remove the lava. Some of the inhabitants may have returned in order to carry off such treasures as were obtainable. But no attempt was made to restore the city. With all their energy the Romans seem to have been paralysed by the spectacle, or to have accepted it as if it were an inevitable fatality for which there was no remedy. At the time of the Fire of London, which foreigners seemed to think was a judgment from Heaven, the citizens made no efforts to quench it, but ran about screaming as if they were distracted. If it were not for the garrulous Pepys, who wrung from the king authority to pull down houses in order to isolate the fire, the destruction would have been far greater. With such examples before us the conduct of the Americans becomes heroic, and demonstrates at least that the vigour of some races of humanity has not deteriorated under modern influences.

GARDEN DESIGN IN ITALY.*

When Vanbrugh was engaged in the creation of Blenheim, he was asked about the kind of garden which would be required. He advised that a landscape-painter should be consulted. According to Reynolds, the architect sought after painter-like effects in his buildings, but he had the good sense to realise that even his picturesqueness would not be sufficient for the treatment of the garden that was to be an adjunct to his palace. If Vanbrugh hesitated about such a commission, we may well smile at the hardihood of some of the men who are prepared at the shortest notice to produce an architectural or an Italian garden, as if the task were as easy as the designing of a factory or other business premises. Vanbrugh, however, attempted some architectural preliminaries for the garden, but they did not meet the taste of the owners, and were shortly afterwards removed.

Vanbrugh, we may assume, as he was as much a literary man as an architect, was acquainted with the history of Italian gardens, and must have been aware that before landscape-painting was recognised as a special branch of art great artists did not consider it was undignified to prepare drawings for the creation of a garden and to have superintended the work. Michel Angelo, Raphael and Giulio Romano were among those who wished to combine art with nature. But although names are not always forthcoming we cannot imagine that more ancient gardens in Italy, of which descriptions have been preserved, could have been laid out by men who were without experience in art. There are many elements of the Loggie of the Vatican by Raphael which recall the paintings of the gardens of Herculaneum and Pompeii, and which Raphael found repeated on the walls of the Baths of Titus and had the good sense to employ as a foil to graver pictures. As for Giulio Romano, he co-operated with Raphael in the Villa Madama, and, according to Vasari, very willingly took charge of the gardens, loggie, fountains, groves and every other ornament that could be devised. There was no more versatile artist, and apparently in beautifying grounds he took care that his works should increase the salubrity of the place.

The Italians of the time when those artists lived looked on themselves as the successors and representatives of the ancient Romans, who had despoiled Greece of so many statues that accommodation for them could not be found within houses. Winckelmann, in describing Hadrian's villa at Tivoli, says that all the museums of Europe were enriched with statues which were excavated there, and that enough must have remained beneath the soil to satisfy the desires of future generations. A large number of statues and busts, he says, have been found at all times in the gardens of Sallust in Rome, and as much may be said of many other places. At a later date, if antique works were not forthcoming, there was an abundance of sculptors who were prepared to produce statues which would continue the ancient traditions. The descriptions which Evelyn gives of the Italian gardens suggest the impressions which they must have made on strangers. He refers to the Villa Borghese as an Elysium of delight. Round the house, he said, is a baluster of white marble adorned with a multitude of statues. At Prince Ludovico's he describes the ground as exceedingly large considering it stood in a city, and in every quarter of the garden were antique statues. Of the Horti Matthæi, he says:—"I was told it was inferior to no garden in Rome for statues, ancient monuments, aviaries, fountains, groves, and especially a noble obelisk, and maintained in beauty at the expense of 6,000 crowns yearly, which if not expended to keep up its beauty, forfeits the possession of a greater revenue to another family; so curious are they in their villas and places of pleasure, even to excess." This statement of Evelyn is a revelation, and as other gardens may have been held under a similar tenure, we can understand why so many of them have been preserved. At one time it was supposed that all those gardens must have been stiff in order to correspond with the lines of the architectural structures that formed part of them. But Sir Henry Wotton, who was well acquainted with Italian work, pointed out that there was a contrariety between building and gardening, for while the former should be regular, gardens ought to be the reverse, or at least arranged with a very wild regularity.

Those who take only an occasional view of an Italian garden are apt to agree with Wotton about irregularity. They see a magnificent spectacle in which nature and art appear to be contending, and where colour is likely to be supreme over form. The series of measured plans which appear in Mr. Inigo Triggs's grandiose volume reveal the wonderful care which was taken to keep up the delusion that nature and accident were the controlling forces. Sections are also given which enable us to understand the reasons for the numerous steps which are so common a feature in Italian gardens and of which Wotton explains the reason. "I have seen a garden," he says, "into which the first access was a high walk like a terrace, from whence might be taken a general view of the whole plot below, but rather in a delightful confusion than with any plain distinction of the pieces. From this the beholder, descending many steps, was afterwards conveyed again by several mountings and vailings to various entertainments of his scent and sight which I shall not need to describe—for that were poetical; let me only note this, that every one of these diversities was as if he had been magically transported into a new garden." The English diplomatist in these words has suggested some of the peculiarities of Italian gardening, and we become more surprised when, by Mr. Inigo Triggs's plans, we see the consummate science which dictated the arrangement. The plans alone are a revelation to people who live at a distance from Italy, and they impart a practical character to the book which is not found in any of those which have appeared of late years.

In addition the author explains how some of the effects have been produced. Water has been called the eye of a landscape garden. But in Italy fountains and cascades are made to give animation to the scene, which without them would resemble a sleeping beauty. Isola Bella, on Lake Maggiore, is one of the most admired of Italian gardens. Water, of course, is introduced, and there is a water theatre. We are told that "underneath the platform is a huge storage tank, which is the *raison d'être* of the whole mount. Water is pumped from the lake, and from this point supplies the whole of the gardens and fountains. The machinery and pumping plant still exists in one of the two hexagonal pavilions on the south side of the mount. On the opposite

* *The Art of Garden Design in Italy*. By H. Inigo Triggs, A.R.I.B.A. Illustrated by seventy-three photographic plates reproduced in collotype, twenty-seven plans, and numerous sketches taken from surveys and plans specially made by the author, and twenty-eight plates from photographs by Mrs. Aubrey le Blond. (London: Longmans, Green & Co.)

Digitized by Google

side a corresponding pavilion was sumptuously fitted up as a garden house, with rusticated angle quoins and a crowning balustrade beset with statues." If provision had to be made by tanks to afford supplies in dry weather, in some places pergolas had also to be introduced on account of the heat. In describing a villa in the environs of Genoa Mr. Inigo Triggs says :—

At Sanpierdarena were many of the best villas, all planted upon the hillside and overlooking the sea, with wonderful expanse of view and bold mountain scenery. The situations were in many respects not well suited to garden making, the soil being barren and rocky, and exposed to the sweeping winds of the Mediterranean in winter, and the parching sun-glare of summer. Under these conditions the designers had to resort more especially to architecture in order to obtain their effects, and instead of the "bosco," which is so generally to be met with elsewhere in Italy, we find a very extensive and charming use of pergolas, in order that all parts of the garden might be reached in shade. At the Villa Fransone the pergolas formed long wings on either side, terminated in summer-houses, and enclosing small gardens on rather sloping ground. The Palazzo Durazzo at Zerbino had a series of pergolas arranged on terraces below the casino. The fresh green foliage of the vines in spring time, and lovely colour-tones of purple, mauve and brown in autumn, are never shown to better advantage than when arranged upon a pergola.

The pergola is used in the Certosa Pavia, and the plate given of the cloister garden of the great monastery is one of the most charming in the volume. Mr. Inigo Triggs is not satisfied with describing in detail about forty of the principal gardens in Italy. He also gives an important historical introduction describing the progress from the beginning of our era. There are 128 large plates, besides plans of gardens, half-tone plates from photographs and old prints, and a large number of illustrations in the text. The author has already proved his competence for such a work by his volume on English and Scottish gardens. He has had the benefit of suggestions from the Baron H. von Geymüller, Professor Lanciani, Signor Beltrami, Mr. Marion Crawford and Miss Janet Ross. He acknowledges his obligations to Mrs. Aubrey le Blond for the photographs. In preparing them the lady "has frequently been handicapped; for the points of view chosen have often been selected more to show the general disposition of the gardens than to obtain the most artistic result." The book is creditable to all engaged in its production, and is worthy of its entrancing subject. The typography by Messrs. Spottiswoode & Co. would satisfy the most fastidious of the old Italian printers. If we believe Sir Walter Scott, the garden had much to do with the advance of architecture, for in connection with it banqueting-houses were erected, terraces extended and connected with staircases and balustrades of the richest forms. The garden was in fact a sort of chapel of ease to the apartments within doors. On that account a book like Mr. Inigo Triggs's will have use for those who may never be called upon to design an architectural garden. In the Italian structures which were connected with the old gardens, greater freedom was allowed than in the villas. We consequently see Renaissance architecture of a kind which does not always correspond with what is seen in the buildings in towns. Apart from use, the plates are delightful to consider, for never was art and nature so satisfactorily combined as in Italian gardens.

An Interesting Find has been made in the floor of the tower of Pancraswyke Church, North Devon, during the process of restoration. Some years ago the base of the old cross was found, but the shaft was wanting. Now there have been unearthed three steps of octagonal shape made of granite, and with edges beautifully moulded, and a square slab upon which the base doubtless rested. The shaft has not yet been found, but diligent search is being made for it. The structure was possibly used as a preaching cross when only the chancel of Early English architecture was in existence.

COTTAGE, NORTON WAY, FIRST GARDEN CITY, LETCHWORTH.

THIS cottage has been designed to meet the requirements of a cheap substantial building to cost not more than 250*l.* The walls and partitions are built with grooved Flettons, the external walls rendered with cement, finished with pebble dashing, the upper part coloured a light cream and the lower a natural grey. The woodwork is generally square or chamfered, the external woodwork stained a dark oak and varnished. The ground floor is finished with cement floated face, for cork lino. The roof, a concrete flat constructed with small steel joists 3 feet apart and coke breeze cement concrete, covered with two layers of half-ply Ruberoid cemented down. The eaves project 2 feet 3 inches all round. It was originally intended to have a battened and local-tiled roof, but it was found by the use of a flat a saving of 24*l.* 10*s.* was effected. Height of all rooms is 8 feet 6 inches clear. The cube of building is 18,454 feet, measured from top of concrete foundation to top of flat. The contract price is 240*l.*, which is about 3¼*d.* per foot cube. This price includes drainage and the house decorated and ready for occupation. Messrs. Tapperell & Haase are the architects. The builder is Mr. W. R. Castle.

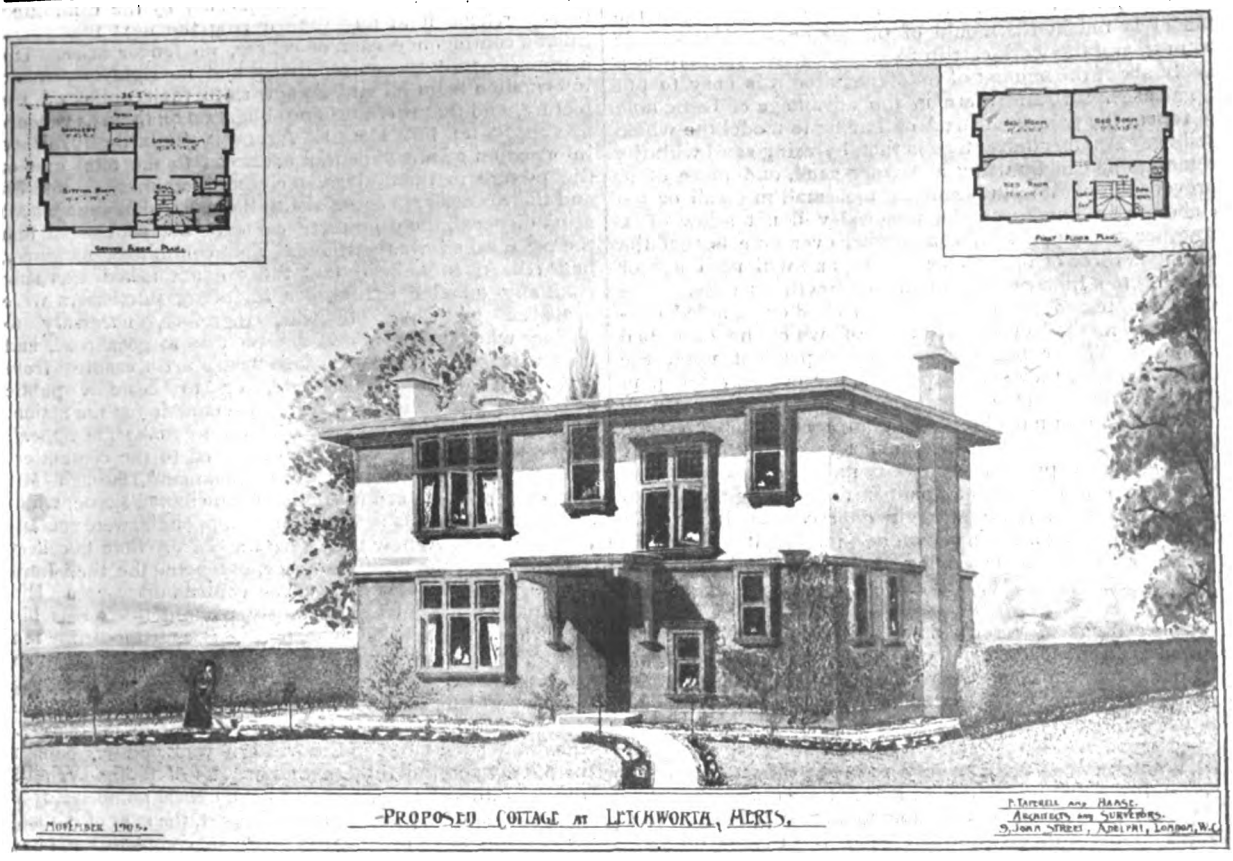
ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. E. T. Hall, vice-president, in the chair.

Mr. Alexander Graham, hon. secretary, announced the decease of Mr. R. A. Bryden, of Glasgow, elected Fellow 1878, and Mr. W. Goldsmith, Associate, elected 1882.

Messrs. Geo. P. Bankart and Laurence A. Turner read papers, illustrated by photographs and lantern views, on

Plasterwork.



Mr. Bankart said that plaster had so long been looked down upon for its modern commonplace vulgarity of treatment that it seemed almost incongruous to think of it as a vehicle of art. Any really healthy revival seemed only seriously possible by again reverting to the beginnings, by the gleaning of some of that simple impulse which urged the artists of the past to find expression in materials and methods most in sympathy with their own nature, and in the right and full development of those methods.

What, the author asked, are some of the abstract points of value to be gathered from a general rumination amongst all the accumulated wealth of the labour of men's hands in the application and shaping of a kind of mud in or on buildings, and what may we rightly take to heart in pursuing or in attempting to give fresh hope and vitality to modern plasterwork? The shadow of the first half of the first century A.D. revealed to us remnants of modelled wall and ceiling decoration of a beauty, subtlety and delicacy never since surpassed or even approached. It spoke to us of the extraordinary decorative instinct of the Greek and Roman in the combination of extreme simplicity of line and surface with refinement and power of execution. For the plasterer the lessons to be learned from these fragments of decorative art can never be too plainly noted or too highly praised. The stucco of the Romans tells us of their investigation, their admiration and of their imitation. This imitation was not the copying of the form, but of the spirit, of the art of the ancient Romans and Greeks. We of the twentieth century have our own religion, our science, our folklore, our national virtues, our industries and manufactures to embody in our art.

Tracing the history of the plasterer's art through Renaissance times, and speaking of the results brought about by the changes in building construction, the author demonstrated that each one of these developments had its marked effect upon the decorative art of the plasterer. From each of these stages it would be found that the plasterer produced his best work when the particular kind of plaster he used, whether stucco, parge, or plaster of Paris, was worked in its own particular plastery way, and was not forced into simulation of carving in marble, stone or wood. The success of his art seemed best assured when his material was put to the fullest right use without abuse.

To the question, Did the Classic or the Renaissance

Digitized by Google

architect consider whether the methods then employed were legitimate or no? the author was inclined to suggest the negative, but that they were accepted as the most convenient and durable methods of expression then known. The primary object of the decoration of a ceiling, or of a wall, as in all decoration, was the giving of pleasure to the eye. The construction of the ceiling had undoubtedly its bearing on the design, but once the impression of sufficient support and strength satisfied the artist, he vied in his emulation to obtain the praise of the patron (eager to outshine his rivals); and to do this, while framing his work with due respect to reasonable economy, he thought chiefly of his enrichment, treated in the language of the time. This point concerning right or mistaken method, whether past or present, had an important bearing on all workmanship. Had the artists of the Italian Renaissance known of the method of casting from moulds of flexible gelatine, the author thought that they as artists would have carried their method to a much greater pitch of perfection, and not so much in mechanical skill as in suiting their forms more particularly to the advantages of the mechanism. He claimed for plaster at least that respect and technical liberty which is due from the artist to any other material or medium of expression, whether the surface of operation be large or small. He believed each period of the art of the plasterer should be regarded on its own merits in combination with the peculiar circumstances and efficiency or inefficiency existing, according to the peculiar materials that it was then most convenient to procure and to manipulate. If mechanical skill be the plasterer's diploma, then should the twentieth century be able to dim the glories of the Italian Renaissance; but we must go back again to simplicity of line, of form and of spirit, in the giving of pleasure with our money's worth. If this object is unattempted and unaccomplished, or undesired by the lack of knowledge of the sense of beauty on the part of the people and of the worker, then the world will be so much the poorer by ignoring not only the art of the plasterer, but all of the lesser arts.

Mr. LAURENCE A. TURNER took for his subject "Decorative Plaster Ceilings," which he divided into two broad divisions, lime-plaster and plaster of Paris. These two materials, he said, required widely different methods in their use. As to which gave the most satisfactory plasteresque result there could not be two opinions. Lime-plaster must take the first place, and ceilings in this material must be modelled *in situ*. The quality we should try to reproduce in plasterwork is that which we find in the Elizabethan and Jacobean lime-plaster ceilings. These form the best models and standard of work for the art. Most are of lime-plaster; but there is no reason why the same effect should not be produced with plaster of Paris. The chief quality that made the old plasterwork so charming was the exceedingly soft, delicate and subtle play of light and shade that was produced on its modelled surfaces. In modern work it is the hardness of line and sharpness of shadow, dead flatness of the unornamental surface, that make it so dreadfully dull. The most satisfactory results in any plaster-decoration we possess are those in which there is no undercutting except in detached ornaments. Therefore it is necessary, in modelling a ceiling, to avoid all undercutting, hard edges and rigidity of line. Court everything that is the reverse of these qualities—softness, rounded contours, soft shadows, breadth of surface and extreme modulation of line and surface. Plasterwork worthy of the name must have the quality of softness. Every atom of it should be modelled. There should be a subtle play of light and shade all over it. The plain spaces as well as the mouldings and foliage should be alive with delicate modelling, and not dead and cold like the early Victorian ceilings. With the many new methods and materials discovered since that Utopian period for plasterers between 1400 and 1600, what can be done, the author asked, to produce a fine, satisfactory, decorative result at a reasonable cost? To make a ceiling nowadays in lime-plaster, using only the methods that those old people used, it is useless to imagine that anything can be done that is not very costly. Besides, the difficulty of obtaining the properly slaked lime renders it almost impossible to model the plaster with the fingers. Tradition says that twenty years was not an out-of-the-way time for the lime to be slaked before use. The author advised the use of Keene's cement if well-slaked lime was not procurable. In ceilings he had modelled *in situ*, in which Keene's cement had taken the place of lime, he had always mixed silver sand and size with it, the latter to prevent the cement from setting too quickly. He did not personally incline to the method of modelling in plaster *in situ*. He pre-

Digitized by Google

ferred to model the ceiling on the bench, in Keene's cement and sand, and to use his fingers only. When the model is finished a mould of plaster or gelatine is made from it, and the work cast in fibrous plaster. If there is a doubt about the amount of relief required it is easy to put up a cast *in situ*, and there is the advantage of being able to repeat the pattern instead of having to model the whole ceiling. Another advantage is that, by using sand with the cement, one can by using a coarser sand, and more of it, prevent the work from becoming too small in detail or too elaborate in finish, for the material will not allow of it. Another advantage of fibrous plaster over lime is that the ceiling is three or four times lighter, and will not crack or fall, as the lime-plaster on laths sometimes does. The author confessed his partiality for ribbed or panelled ceilings, the method of construction of which he described in detail. Their beauty is chiefly dependent upon the modelled effect they should possess, the ever-varying play of light and shade of a most subtle kind. Very great care must be taken in modelling the plain ground for this type of ceiling, as the richness of effect is chiefly dependent upon it. The practice of using moulded wooden ribs, dividing up a ceiling into panels and painted white to appear like plaster, he strongly deprecated. It had the result of bringing a ceiling down and making it look heavy, whereas a well-modelled ceiling of plaster does the reverse, making the room look lighter and giving a sense of greater space.

The ceilings of Wren's date, although very beautiful, depend upon their design for their beauty and not upon that quality which is peculiar to plasterwork. They might equally well have been carved in wood or plaster. The Adams ceilings made, the author believed, entirely from carved wood moulds or carved wooden models, are hard and uninteresting, though very refined; they depend for effect entirely upon their design and not upon modelling.

With regard to the question as to how far the architect should supply drawings for a ceiling, the author thought that nothing more than a small-scale drawing indicating the type of work he required should be given to the modeller; more than that only hampered him. The architect should supervise and criticise the models, but unless the modeller did the details himself the result would probably lack life and freedom.

The author, in conclusion, emphasised his view that if a plasteresque effect be wanted the whole ceiling should be softly modelled, mouldings as well as ground; but if that was not to be, then let it be, frankly, carving produced in plaster.

Professor BALDWIN BROWN proposed a vote of thanks to the authors of the two papers. The historical side, he said, had not been dealt with as had so often been the case in previous meetings. The history of plasterwork was interesting because the most ancient nations were perfectly familiar with the material, and used it in the utilitarian sense, though they did not realise its artistic possibilities. The Greeks used terra-cotta where we should use plaster in decorative work. It was sometimes suggested that there was a gap in the use of plaster between Classic times and the period of the Renaissance, but the speaker held that the fine examples of Mediæval work to be found on the Continent proved that there was no real break in the decorative use of the material.

Mr. W. H. ATKIN BERRY seconded the vote of thanks.

The CHAIRMAN, in terminating the proceedings, announced that a special general meeting would be held on Monday, May 7, when the Chairman will bring forward a resolution that the President and members of Council do retain office until the conclusion of the congress to be held in July, and that by-law 30 be temporarily suspended to enable them to do so.

By-law 30 limits the tenure of office by members of Council to the close of the last general meeting in June of the year following that in which they were elected.

NATIONAL ART COLLECTIONS FUND.

THE annual report of the executive committee of the National Art Collections Fund has been issued. The King has consented to allow his name to appear as patron. The report describes the negotiations for the "Rokeby Velasquez," which was purchased in January from Messrs. Thomas Agnew & Sons for the sum of 45,000*l.* According to the report:—

"On the understanding that the picture should go to the National Gallery, Messrs. Agnew offered it for 45,000*l.*, at which sum they undertook, if requested by the committee, to repurchase it at any time during the next two years. Such a contingency can, of course, no longer arise. The committee fully recognised that it had no right to demand information from Messrs. Agnew as to their outlay on the picture, and that there was no obligation on them as vendors to supply it; but Messrs. Agnew voluntarily furnished information of a confidential nature as to the total cost of the picture to themselves, including commission, interest and their other expenses. With the particulars thus placed at its disposal, the committee came to the conclusion that the price asked was justified. The committee, moreover, had reason to believe that the amount asked was substantially smaller than other intending purchasers were prepared to pay. It was, therefore, necessary to decide whether to allow the picture to go abroad, and thus meet with the fate of so many art treasures from private galleries in England, or to issue a public appeal for the money necessary to secure it for the nation. The committee unanimously decided to make the appeal. Generous contributions were promised to the committee, including 10,000*l.* from 'An Englishman' (through Mr. Herbert Cook). Lord Michelham contributed 8,000*l.*, while other large sums, as set forth in the appendix, were guaranteed. Messrs. Agnew then gave the Society time to collect the balance of the purchase price, extending the time limit on two occasions, and themselves contributing 5,250*l.* His Majesty the King was graciously pleased to express his approval of the efforts made by the Society to secure the picture, thus removing many difficulties and giving much encouragement to the committee. On March 14, 1906, the 'Venus and Cupid' was handed over by the Society to the Trustees of the National Gallery as a gift to the nation. It has now been hung on the western wall of the Spanish Room, between the full-length portraits of Philip IV. and Admiral Pulido Pareja, and bears the official number 2,055. Up to the date of publishing this report, the sum of 1,700*l.* still remains to be collected in order to complete the purchase price, for the payment of which sum further time has been extended to the committee. It is, however, desirable that this liability should be discharged as soon as possible in order that the Society may be free to work in other directions."

Other acquisitions include Whistler's "Nocturne in Blue and Silver" (Old Battersea Bridge), which was purchased by the fund from Mr. Robert H. C. Harrison for 2,000*l.* and presented to the trustees of the National Gallery in July of last year; an oil-painting by John Sell Cotman, A.R.W.S., showing a cottage, figures and boat, which was presented to the National Gallery of Scotland in August 1905; drawings by Jacopo Francia and Timoteo Viti, presented by Mr. Max Rosenheim, through the fund, to the British Museum; a Rhodian ware jug with silver-gilt mounts, of the second half of the sixteenth century, bearing the hall-mark of the town of Utrecht, now exhibited in the Victoria and Albert Museum; an Italian majolica albarello or pharmacy jar, probably of Florentine manufacture, *circa* 1460, purchased in October 1905 and presented to the British Museum; and two drawings by Auguste Rodin, presented to the fund by Mr. Claude Phillips, and now in the print-room of the British Museum.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of the Institute was held in the rooms, 187 Pitt Street, Glasgow, Mr. John Keppie, president, in the chair. The President referred to the death of Mr. R. A. Bryden, who was one of the original members of the Institute, having joined in 1868, and it was agreed to minute an expression of deep regret. The secretary submitted the annual report, which stated that during the past session the Council had been actively engaged with the arrangements in connection with the scheme for amalgamating the Glasgow Architectural Association with the Institute. The attention of the Council was called to the undue proportion of unpaid apprentices employed in many architectural offices, and, as the matter was considered of special urgency, a circular calling attention to this was issued to the members of the Institute, asking them to adhere as far as possible to the practice of employing one apprentice only to each draughtsman. The Council desired to call attention to the facilities for study which were available in the recently established Glasgow School of Architecture, conducted by the Technical College and the School of Art. With reference to the reconstruc-

Digitized by Google

tion of the Royal Infirmary, the report stated that the proposal to employ terra-cotta had, it was understood, been departed from. The report was adopted. The President, in his valedictory remarks, referred to the subject of registration as perhaps the most important matter before the architectural profession at the present time. Although the scheme for amalgamating the Glasgow Architectural Association with the Institute had not yet been formally carried out, he hoped the matter would be completed at an early date. The Council for the ensuing year was elected as follows:—Messrs. A. N. Paterson, John Keppie, H. K. Bromhead, James Lindsay, T. L. Watson, James M. Monro, Alexander M'Gibbon, Andrew Balfour, Charles Gourlay, Thomas Baird, jun., R. D. Sandilands, George Bell, Alexander Skirving, Robert Miller, John B. Wilson and H. E. Clifford. The treasurer's accounts, which were submitted and approved of, showed that the funds were in a satisfactory position. A meeting of the newly-elected Council followed, at which office-bearers for the year were appointed, viz.:—President, Mr. James M. Monro; vice-president, Mr. George Bell; auditor, Mr. Alexander Skirving; secretary and treasurer, Mr. C. J. MacLean. The various committees for the year were also appointed.

CULROSS ABBEY.

A LECTURE was delivered in the Stephen Memorial Hall, Culross, on the 19th inst., by Mr. John L. Anderson, who has charge of the restoration of Culross Abbey. At the outset, Mr. Anderson, says the *Dunfermline Press*, explained that, after many requests, he had decided to let the people of Culross—those who were intelligently interested in the restoration—have an opportunity of hearing what he had to say on the subject. Notwithstanding the unavoidable use of technical terms, he was persuaded that, with the intelligent interest with which the residents had watched the progress of the work, they would be able to follow him in his description of it. In the course of restoration there had been found specimens of Celtic and Norman work, with chevron work, interlaced rope work, chain mail, &c.—delicate work to reproduce in stone—which proved that the church must originally have possessed great architectural beauty, besides being of large extent. All that remained of the Celtic or original church, so far as had been discovered, extended from the west side of the old manse gable to the west side of the south tower door. All that remained of the second addition was that portion occupied by the lancet window on the south, and which extended only from the west side of the south door to the west corner of the buttress. With regard to the addition extending eastward to the west wall of the south transept, he said that, while rebuilding the south transept and restoring the west respond of its great arch, there was furnished conclusive proof that at one time this had been an outside corner, and an examination of the inside showed where the wall which had crossed the present nave had been roughly dressed off. The mode of construction of this addition was contrary to custom and the rules of good masonry, the stones being built in high courses and set on edge. Judging by the portion which remained, and upon which a corner of the tower was built, the original wall had tumbled down, and at a late restoration had been faced up with new ashlar and degraded with modern windows. At the restoration to which he referred a gallery door had been slapped out in the east wall of the tower, which had been wholly "unsalved" or lintelled. The south tower door, which had been arched over, suffered similarly by the same ruthless hands, which had materially lessened the stability of the tower, and it might be necessary at no distant date to erect a flying buttress at that point to support the tower. The next addition to the nave extended to the east end of the transept, or rather on a line with the east wall of their aisles. There was only the smallest fragment of this extension remaining. Dealing with the south transept, he said that the two arches which opened into the south transept were insertions. The centre pier between them had suffered severely through vandalism and superstition. The vandals had almost totally destroyed the base at the respond of the main arch, and also a portion of the work above. On examining the foundation preparatory to restoring the work, it was discovered that the foundation, which extended clean across the opening, had been laid with large pieces of black limestone bedded in yellow clay. The foundations beneath the piers had been disturbed, and the whole superstructure had to be supported while the excavations beneath were being made to a depth of about 4 feet. At two places sufficient had been cut away to get the head of a coffin in, others had apparently been satisfied to be buried with their feet against it, and evidently their faith in "that pillar of the kirk" had been too strong for its benefit and safety. In the present restoration there had been put in a substantial foundation of concrete, and the required level had been built up with brick and cement. The base moulding was an exact reproduction of the original, and which was taken from fragmentary parts. The foundation of the respond suffered through modern improvers, the clustered shafts through vandals; and the carpenter, in order to get a rest for a gallery beam, butchered the cope, and just escaped bringing the ponderous arch down upon himself, and later, the congregation. Having condemned the carelessness of former restorers, so far as concerned the walls of the south transept, the lecturer proceeded to say that a curious discovery was made which tended to force the idea that that portion of the church stood roofless for a long period. The wall just over the south-west side of the main arch had been plastered over, and, on a portion being cut away, there was discovered what at one time had been a jackdaw or magpie's nest behind some loosely filled-in stones. In the nest were pieces of mussel shells, heather, twigs, hair and several human ribs, whilst over the arch, when the wall had been rebuilt, were many roots of ivy, of great thickness, decayed. The discovery of an octagonal column and the subsequent discovery of the crypt beneath had assisted in the solution of some problems and intensified others. It proved that the cloister arches had swept around the quadrangle in ogival fashion, and that the octagonal column had belonged to the chapter-house, which was usually a lofty, vaulted apartment. Situated south of the transept, its ordinary form was polygonal or octagonal. In the case of the Benedictine churches it was square. There was a Roman-arched door in the south wall of the transept, which, it was supposed, the monks would pass through on their walk from the cloisters to midnight Mass. Many basilican churches, they were told, were erected out of fragments taken from older buildings, and presented a curious mixture of columns, capitals, &c. The ancient builders of Culross Abbey had faithfully followed the example, for in the heart and foundations of what one might naturally suppose to be the oldest wall, there were found in the present restoration scheme massive and delicate specimens of rich masonry. The west wall appeared to be of older date. Of particular interest was the lecturer's description of the discovery of a large burying vault, the sides of which were built with finely-hewn ashlar. The soil with which this vault was filled had been imported; it was rich in colour and very free, and quite unlike any of our native soils. Within that transept, with the feet below the centre of the north arch of the arcade, there was discovered a stone coffin, with a body completely shrouded in leather and which was in a fair state of preservation. The part enclosing the feet had given way just above the ankles. On examination it was found that the body had been swathed in woollen garments, and the place which the feet had occupied was as distinctly impressed in the shroud as was a strong glove on the hand being withdrawn from it. Just beneath the De Quincy arch a much older coffin was found, called a kistvaen. This coffin might have contained the remains of Roger de Quincy, for his coat of arms was carved on a shield on the keystone of the arch over the grave. At some length the lecturer dealt with the great east window which had now been restored, and he added that the north transept had also been restored with arcade arches to correspond with that of the south. A lady of Culross had kindly offered to fill in with stained glass the north window. The north wall of the nave from the chancel to the tower had undergone many changes, and had suffered by the hands of the barbarian. It was difficult to understand the story that all might read on the west wall of the main entrance to the church. In the first place, that wall was not a part of the original church. It corresponded neither with the south nor the fragment of wall to the north, as regarded bond, style or finish. In conclusion, the lecturer said:—After a long sustained calm, Culross Abbey has been resurrected out of the forgotten past, and invites a critical inspection of her relics, in comparison with the oldest of our nation.

The Estate of Mr. John Price, surveyor of the city of Birmingham since 1896, and who died on March 6, has been returned at 10,634*l*.

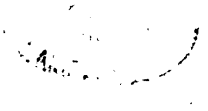
NOTES AND COMMENTS.

A position is vacant which should have attraction for many archæologists, viz. the Directorship of the British School at Rome. The salary offered is only 400*l.* per annum, with a residence rent free on the school premises in the Odescalchi Palace. In an office of the kind a man could serve not only archæology but Great Britain. The French and the Germans have succeeded admirably, for there can be no doubt that the prestige of both peoples has been increased by the efforts of the officials who represented them in Rome. England avoided the city through apprehensions that archæology might subserve the interests of the Papal Court, and as a result people on the Continent imagined that Englishmen cared only for the present and were indifferent to antiquity. Applications for the appointment are to be sent to the Secretary of the committee at 22 Albemarle Street on or before May 15.

Among the causes which have produced the depreciation of agricultural land compulsory education has not hitherto been included. But a paper which was read before the Surveyors' Institution by Mr. J. W. Willis Bund, chairman of the education committee of the Worcester County Council, maintained that evil effects have followed in rural districts from the working of the Education Act of 1902. County Councils had to provide not only elementary but higher education, and in consequence rates varying from 6*d.* to 1c*d.* in the pound had been created. Owing to the extravagant manner in which the Board of Education required schools to be constructed, and the increasing demands of inspectors, still higher rates would have to be levied. The rural ratepayer would, of course, do all he could to reduce the amount by disregarding the number of children which a school could contain and by seeking for a cheaper class of teachers. According to Mr. Willis Bund, the result of the excessive requirements of the Board of Education would therefore be the smallest possible amount of schooling and the cheapest possible teachers, neither of which would promote education. The Act would also lead to an increased migration from the country to the towns, for unless rates were reduced tenants could not pay the excessive charges. Mr. Willis Bund acknowledged that he could not suggest a remedy. But he believed that the law as enforced was an act of peril to the country. The paper suggests one side of the education question. Whoever will have to pay, it is no longer possible to expect the continuance of the old class of rustics who at one time carried out all agricultural operations. Men who are ignorant do not wish that their children should be brought up in a similar condition, nor are they desirous that they should always live within a very limited area. It may be that the new race of rustics will not be as useful as their predecessors who were unable to read an advertisement of an auction. But in the social revolution in progress primitive ways are doomed to vanish.

The Salon this year will differ in one respect at least from its predecessors. The Minister of Fine Arts has decided that the Government factories are to send some of their latest productions to the exhibition. From the Gobelins will come the large panel after the cartoon of Jean Paul Laurens, entitled *The Apotheosis of Colbert*. That statesman deserves honour from artists, especially from designers and weavers of tapestry, for it was at his recommendation the Gobelins became a public institution. Ostensibly Colbert's object was to uphold the greatness of Louis XIV., but so prescient a man may have anticipated a time when others besides monarchs would find a pleasure in the art. The factory at Beauvais will contribute panels by MM. Cormon, François and Coste. The beautiful pottery at Sèvres will also be exemplified, and especially by some reproductions of eighteenth-century work.



The old complaint with regard to the congested state of the harbour of Alexandria still exists, though much is being done by the port authorities to remedy the evil. New quays for the storage of coal, providing accommodation for ten ships outside the mole, are being built, and a harbour and breakwater at Mex for landing cattle are also in course of construction. New quays for the unloading of timber are to be built at Gabbari. The work has already been commenced, and it is expected that the berths will be ready towards the end of 1908. Owing to the depth of water in the Boghaz Pass being insufficient for large vessels, it was decided some time ago to dredge a second channel. The new pass is to be nearly three-quarters of a mile long, 600 feet wide and 35 feet deep at low water. Dredging operations began last June, and one-third of the work has been finished.

It has been arranged that the International Association for Testing Materials, which holds its congresses about every three years in industrial centres in various countries, shall this year meet in the Academy of Science at Brussels from September 3 to 8. The King of Belgium accords the Congress his patronage, while Prince Albert of Belgium will be one of the honorary presidents, as also will the Ministers of Finance, Railways, War and Trade, and the Mayor of Brussels. The programme of excursions includes visits to the harbour works at Brussels and at Antwerp, the steel works of the John Cockerill Company at Seraing, the arsenal at Mechlin and the harbour works at Zeebruge. Among the papers to be read will be one on the "Industries of Belgium," by Baron E. de Laveleye and M. Camerman. It is expected that a considerable number of members and delegates from this country will be present at the Congress. Mr. J. E. Stead, F.R.S., Middlesbrough, is the English secretary of this Institution.

Pinkie House, Musselburgh, which by permission will be visited by the members of the Edinburgh Architectural Association to-morrow (Saturday), is situated amid charming gardens and pleasure-grounds, is a well-preserved and fine example of sixteenth and seventeenth-century architecture, and has many features of very special interest. There is a lofty turreted tower on the west side. The north gable is flanked by massive square turrets, with a balcony between. A fine oriel window is a unique feature in the south front, and the row of lofty chimneys on the west side are most imposing. The well in the courtyard is an elaborate and fine composition. There is a painted gallery, upwards of 80 feet long—perhaps the finest example of this kind of architecture in Scotland—and there are many beautiful plaster ceilings and other interesting details. Afterwards there will be a visit to the church and presbytery of Our Lady of Loretto, Musselburgh.

The British Consul at Stockholm, in his report on 1905, says that at the beginning of the year hopes were entertained that the prices, which then ruled low, might fall no further, and during the course of the season these hopes were justified, except as regards redwood deals. In their case the demands did not correspond with the supplies, and the third and fourth qualities of 3 by 9 inches redwood from the middle of Norrland went as low as 7*l.* 15*s.* and 6*l.* 15*s.* respectively. For other kinds of wood an improvement in prices took place at the end of summer or beginning of autumn—a time when prices often show signs of weakness—whereas in 1905 they manifested a tendency to rise. This was chiefly due to orders received from Germany. Even before the shipping season was at an end buyers there paid for delivery during 1906 10*s.* more per standard for battens and white and redwood boards, these being the goods most in demand in the German markets. The strong impulse thus given by these buyers soon showed its effects in other quarters. Within a short time importers from various other countries began to send in their orders.

ILLUSTRATIONS.

NEW BUILDING OF THE EDINBURGH LIFE ASSURANCE COMPANY, 122-128 ST. VINCENT STREET, GLASGOW.

THE new building in St. Vincent Street, Glasgow, of which Mr. JOHN ARCHIBALD CAMPBELL is architect, was recently opened. The company, which is the oldest of its class in Scotland (Sir WALTER SCOTT was one of the founders), has had offices in Glasgow since 1824. A suitable site having been obtained, the building we illustrate was commenced in 1904. The style adopted is a modern treatment of Italian Renaissance. The front is built of the best white freestone, and the construction throughout has been arranged on the most approved scientific principles, the framework of the interior and the back elevation being of steel. The columns are encased in brickwork and the beams in concrete, making the building fireproof throughout. By the extensive use of steel the maximum amount of window space is gained, a matter of the utmost importance in office property. While the company will occupy the offices on the ground floor, the building has been planned principally for letting purposes, and every attention has been paid

ENTRANCE.

to the convenience of tenants. In the entrance hall the walls and floor are lined with marble, the wood finishings being of the best hardwood. Access is gained to the upper floors by two large staircases (one of them entered from the back lane) and by two electric hoists embodying the latest developments, the cages for which have been specially designed. The sanitary work has received every attention; the electric fittings have been made specially for the building. The company is progressive, and the estimation in which it is held is shown by the increased business in 1905 as compared with that of 1904. The total funds at December 31, 1905, amounted to 4,085,850*l.*

VILLA IN COBLENZ.

143 AND 144 FLEET STREET, E.C.

THE architect of this building, which is adapted for commercial purposes, is Mr. R. M. ROE, F.R.I.B.A., who, however, has not had a free hand, as Sir J. G. TOLLEMACHE SINCLAIR, Bart., who has of recent years made a hobby of erecting buildings in the City of London, insisted upon some features which, to say the least of it, are of a somewhat incongruous nature. The style is certainly of a somewhat novel character, although the main features are late Gothic, and the statue of Queen MARY OF SCOTS which adorns the front is only one of the ideas which Sir J. TOLLEMACHE SINCLAIR has caused to be realised in stone. He, however, has not interfered with the interior of the building, which is admirably adapted for business purposes.

EDINBURGH LIFE ASSURANCE COMPANY, GLASGOW.—PLAN OF GROUND FLOOR.

SHAKESPEARE AND OLD LONDON.

A PAPER was read before the Society of Architects on Thursday, April 26, by Mr. T. R. Croger, F.R.G.S., F.Z.S., F.P.S., on "Shakespeare's London." In commencing his paper, Mr. Croger briefly sketched the early career of the poet, who, he said, when 18½ years of age married Ann Hathaway, who was 27. Three years later he left home; it was not known if he came direct to London, but we might infer that he came very shortly after, that he took employment under Edward Alleyn (the actor-manager), the founder of Dulwich College, and afterwards rapidly rose in his profession, so rapidly that in the year 1594 he had achieved great distinction, and was in that year playing before Queen Elizabeth at Greenwich, in company with the greatest tragedian and comedian of the time—Burbage and Kemp.

When Shakespeare arrived in London he found it in a state of great excitement, preparing for war with the Spaniards, and many of Shakespeare's patriotic utterances are due to that time. With regard to the existing remains known to Shakespeare, London Stone is one he mentioned in the play of "Henry VI.," and makes Jack Cade to sit upon the top of it, strike it with his sword and order "that conduit run nothing but claret wine this first year of our reign." At that time London Stone was on an obelisk propped up by iron bars, as described by Stowe, and was originally put up by the Romans in the centre of their camp, the site of which is now occupied by Bush Lane House and part of Cannon Street Hotel.

In 1594 (a very important year in the career of Shakespeare) he lived in the parish of St. Helens in Bishopsgate, where he was rated at 5*l.*, on which he paid 13*s.* 4*d.* Sir John Spencer, the Lord Mayor at the time, lived in Crosby Hall and was rated at 300*l.* a year, on which he paid 40*l.*; but money then had about eight times its present value. In the play of "Richard III." the hunchback Duke of Gloucester was living in Crosby Hall (then called Crosby Place); in the first scene of that play he stopped a funeral procession, made love to Lady Anne, the chief mourner, slipped a ring upon her finger and bade her "presently repair to Crosby Place." It was in that fine old mansion that Shakespeare makes Gloucester to have the interview with the murderers employed to do away with his brother Clarence, the interview concluding with the words, "Tut, tut, my lord, we will not stand to prate; talkers are no good doers; be assured we go to use our hands and not our tongues." The church of St. Etheldreda, Ely Place, is all that remains to us of the palace with 40 acres of gardens occupied by the Bishop of Ely. In the same play of "Richard III." Shakespeare makes Gloucester interrupt the proceedings of the Council by saying, "My Lord of Ely, when I was last in Holborn I saw good strawberries in your garden there." It was also here that the scene of the death of John of Gaunt took place (see "Richard II.").

Bankside was the scene of most of Shakespeare's dramatic achievements. It was the pleasure garden of London, where there were fish-ponds and bull-baiting and bear-baiting rings, and two theatres, and it became the fashionable and artistic resort. In the church of St. Saviour's, adjoining, the poet's youngest brother, Edmund, "a player," was buried in the year 1607 with the "forenoon knell of the great bell," a great honour doubtless paid him by his elder brother. Two of Shakespeare's colleagues lie in the church—Philip Massinger, who succeeded Shakespeare as a playwright, and Fletcher, an actor.

When a young man there is no doubt Shakespeare was prosecuted for poaching by Sir Thomas Lucy, whom he described as "A Parliament man, a Justice of Peace; at home a poor scarecrow, in London an ass," and in "The Merry Wives of Windsor" as Justice Shallow. That London residence was probably in the parish of Cripplegate, as we find in that church two monuments erected in memory of members of his family.

Westminster Hall was mentioned, where Shakespeare lays the pathetic scene in which Richard II. hands the crown to Henry Bolingbroke, a scene which Queen Elizabeth forbade a repetition of. The "Comedy of Errors" was played in the Hall of Gray's Inn (built in 1555) on December 28, 1594. It was on the occasion of a feast given to the gentlemen of Lincoln's Inn; great trouble arose through want of room, and probably through want of provisions, the consequence being a free fight in the open square between the visitors and their hosts. One of the former afterwards wrote, "a sorcerer had foisted a company of base and common fellows to make up our disorder with a play of errors and confusion." "Twelfth Night" was first performed on February 2, 1602, in the Hall of the Middle Temple (built in 1572); we gather this from the entry in the diary of a student, who added, "the players got 10*l.* for their pains." Queen Elizabeth died at Richmond Palace (built in 1501, part now standing) in 1603, and Shakespeare and his company were playing before her only a few days prior to her death.

When James I. came to the throne he was a great patron of the drama, and had no fewer than four companies in the employment of himself and family. On his approaching London he was met at Stamford Hill by the mayor, aldermen and commons of the City of London in state, and in the procession were nine actors robed in scarlet, Shakespeare being one of them. They marched to the Charterhouse (built 1371), where King James stayed before entering London.

Numerous other interesting facts were mentioned in explanation of the photographs thrown upon the screen, and the lecturer closed by saying that if his audience were of opinion that the plays of Shakespeare were written by Bacon, then all the facts that he had been relating were as applicable to one as to the other, for Bacon was born three years before Shakespeare and died seven years later.

ARCHITECTURAL TRAINING IN EDINBURGH.

THE annual meeting of the Edinburgh Architectural Association was held last week. Mr. H. O. Tarbolton, the president, was in the chair.

The chairman of the committee of management reported that 1907 would be the jubilee year of the Association, and it had been suggested that the event should be celebrated by holding an exhibition and inviting the Royal Institute of British Architects to hold their annual dinner and other meetings in Edinburgh that year.

Mr. Hippolyte J. Blanc, R.S.A., was elected president for next session.

Mr. Tarbolton, in his valedictory address, said the movement of the Association had been in a forward direction, and their position as an active agency for good in the city was yearly increasing. They all looked forward to the time when the municipality would look to the Association for guidance in questions that affected the architectural development of the city, and he was of opinion that, when so called on, their efforts would be given ungrudgingly and in a disinterested way. After a review of the work of the session Mr. Tarbolton said that matters dealing with the training of the architectural student had been very much influenced by recent events and possible forthcoming changes in art education in Edinburgh. The proposed new municipal art school must of necessity be concerned with the general principles of art education, but could not be expected to carry its students into the higher regions of the particular science of architecture. That such a school was likely to be instituted in Edinburgh was a matter for congratulation, and with it would be introduced, he hoped, a new era of art activity. He was of opinion that the curriculum of this proposed school should exhaust the various branches of art teaching in their more general aspects. He was, of course, more especially concerned with the facilities that would be given to architectural students. The foundation of this art school would be a task that would demand the most disinterested and anxious attention on the part of the municipality, and he hoped no steps would be taken without consultation with acknowledged experts in architectural training.

With regard to the selection of the board of management of the new art school, the more representative it could be made the wider its sphere of usefulness would be. The success of the school would depend greatly on the executive committee, which should consist mainly of the teaching heads of the various departments. He maintained that the teaching throughout the school should be of a synthetic nature, *i.e.* that there should be common groundwork for all the teaching, so that free intercommunication could take place between the various branches of study. There should be accommodation for students in every department in art,

Digitized by Google

and all students should be trained up to a certain point before particularising in any one branch. Painters, sculptors, decorators, designers and architects should have a definite and common basis of art training, for he was convinced by so doing the student would be enabled to discover his real vocation. Painters would benefit by an architectural training, and architects would gain immeasurably by a knowledge of the theory, and possibly practice, of painting. At present men following the various art callings worked on almost parallel lines which seldom touched, and more overlapping would produce mutual benefits. He thought, of course, that practising architects should be, as far as possible, on the teaching staff, so that certificates of proficiency which would be the reward of a student's success in the school might have a proper value among outside architects. He would also strongly advise that opportunities should be given to advanced and successful students to continue in the school as pupil-teachers. Such a grade of teachers would often be the means of giving a helping hand to less advanced students and so keep the extremes of the community well in touch. It would also be the means of keeping on students in the school, who, from pecuniary necessities, might otherwise have to seek employment elsewhere. By having practising architects closely connected and identified with the school in place of a regular system of permanent teachers, pedantry and doctrinaire views would be avoided. He thought that a certificate or diploma obtained from such a school and endorsed by the master under whom he had served his apprenticeship would give a student a distinct status at the outset of his career.

With regard to the subjects which would be necessary for the course of art and science training of the architectural student, he could only quote from the recommendation of the Board of Education of the Royal Institute of British Architects as follows:—1. The nature and properties of building materials. 2. Construction, including (*a*) applied mechanics and mathematics in so far as they were necessary to the solution of problems of construction; (*b*) the practical methods of the building trades. 3. Architectural drawing, including (*a*) in the elementary course—geometrical, freehand, perspective and graphic methods of working out problems and such drawing as will train the student in the selection of form and in the study of mass and proportion; (*b*) in the more advanced course—drawing of a more advanced nature, and to include a course of study from the antique and life. (He should certainly like to add to this course the theory of colour, which he considered most important for all architects.) 4. The study of architectural forms that have been evolved in the architecture of the past out of constructional necessities, and exercises in the design of construction to meet definite problems. 5. The study of the history of architecture in so far as it illustrates and explains the evolution of architecture through constructional material and social conditions. The new school for architectural training would not be complete without a workshop where demonstrations could be given in actual materials. Modelling, too, should be taken as an item in the general art studies. He need hardly add that a well-selected architectural library would be a very necessary complement to the school. A school established on the above lines would give a very thorough and general training, and would lay a sound foundation on which the student might continue his studies in later years. In order, moreover, that the benefits of such a school might be more deservedly available, bursaries, rewards or grants might be made, so that either the poor student of promise might be enabled, or the promising student of means might be encouraged, to take fuller advantage of the means afforded by the Institution. It was, indeed, earnestly to be hoped that the proposed new municipal school of art would be able to attract as a Mecca from all quarters and in ever-increasing numbers the true students of art, and that it would afford them every facility for the prosecution and perfection of their peculiar vocation. There was here a wide and proper field for the philanthropic testator, not for charitable purposes only, but to insure real national advantages. In closing, Mr. Tarbolton inquired what the Universities were doing for architecture, and remarked that the time had come when the Universities of the country must recognise the true dignity of the art and science of architecture and its position as an element in a true liberal education.

Professor Baldwin Brown said, with regard to the question of architectural education and the new art school that they hoped would be established before long, they would like to see architecture taught in the school according to a proper system, and that the whole decorative arts would be grouped together under architecture and looking to architecture as their head. He should like painting to remain in their new system entirely under the control of the Royal Scottish Academy, so as not to break the long and honourable tradition of the life school of the Academy. If that tradition were broken, they would do more harm than good to that branch of education. They would do best by building on the foundations they had. He should very much rather there was not a committee of management at all, but that there was placed a thoroughly competent architect, familiar with all decorative arts, as the head of the school, with a free hand to organise it and to gather round him those helpers who he felt would be of advantage for his work.

ENGLISH ROYAL HERALDRY.*

HERALDRY is largely the outcome of the almost universal symbolism which is found among the remaining traces of primitive peoples. Signs like the swastika and triskele, which were in all likelihood astronomical, represent a large group of these marks, and another large group can be found which owe their origin to natural forms, as, for instance, the Egyptian "Ouza," or sacred eye.

These signs were worn as personal ornaments as well as doing duty on rocks, buildings and works of art. But at a period when savage men gathered themselves together into families or tribes, we find tribal marks or totems, and these I imagine are the prototypes of our modern heraldry, where all members of the same armigerous family use the same coat-of-arms, supporters, crest and motto.

Heraldry, as we know it, is a Mediæval art, fostered particularly during the Crusades, when armour reached a state of development in which it entirely covered up the wearer. It was obviously necessary to have some outward and visible sign of the identity of such a warrior, and an easy way to obtain this was the addition of some personal badge on the top of his helmet; hence the crest, which is a personal mark, and should never be worn except by the person entitled to use it. A crest on a livery button is wrong; the proper mark on a serving-man's dress is a badge.

Besides the crest the shield offered an obvious field for distinctive marks, but it had the disadvantage of being easily lost, so the crest on the helmet was originally the more important. Kings wore circlets of gold over their helmets, and many interesting adventures resulted.

At tournaments and on State occasions knights had the caparisons of their horses emblazoned with their arms and also their own surcoats. At tournaments knights not actually fighting had their shields carried by pages, who were often dressed in fancy costumes, often in the form of animals—hence the heraldic supporters.

The traditional coat-of-arms of Normandy is "gules, two lions guardant or," and it is supposed that this coat was used by our Norman kings with the exception of Stephen—who is credited with three centaurs with bows and arrows—Sagittarius. At the same time it must be said that there is no official authority for the existence of the two lions until about 1180, when they show on the seal of Prince John, Lord of Ireland, in which case the prince, on horseback and in armour, carries a shield on which are two lions passant guardant. Henry II. married Eleanor of Aquitaine, and the traditional coat-of-arms of that country was "gules, a lion guardant." St. George was, moreover, the patron saint of Aquitaine. On the second great seal of Richard I. the shield carried by the king shows three lions, and this coat has remained the coat-of-arms of England until the present day, that is to say, for a longer period than the royal coat-of-arms of any other nation. The only interregnum was during the Commonwealth. We have seen that Normandy was credited with two golden lions on a red ground, and that Aquitaine was credited with one golden lion on a red ground, and so we may presume that Richard combined the coats of his father and his mother, and so arrived at his three golden lions on a red ground, the oldest royal coat in Europe.

This same coat was used by Richard's successors until the time of Edward III., but on his third great seal, made in 1340, he uses the coat-of-arms of France, "azure semée de

* A paper by Cyril Davenport, F.S.A., read before the Applied Art Section of the Society of Arts.

Digitized by Google

fleurs-de-lys or," quartered with England. His reason for doing this, as well as for his assumption of the title "Rex Franciæ," was that he claimed the throne of France by right of his mother Isabella, daughter of Philippe IV., as her three brothers (Louis X., Philip V. and Charles IV.) died without any heirs. The French coat as well as the title was retained by our English sovereigns until the legislative union of Great Britain and Ireland in 1801. The crest of a lion statant shows clearly on the great seals of Edward III. on a cap of maintenance, but afterwards it is shown on a royal crown.

In early descriptions of coats-of arms the animals shown on the English coat are described as leopards. The reason for this is that heraldically a lion is a rampant beast, showing only one eye, one ear, and standing upon one foot. In any other position he was described as a leopard, and considered to be acting the part of one. In such cases, however, the animal only bears that name as an heraldic title. A true heraldic leopard has spots, no mane and an untufted tail. Our English lions have manes, no spots, and tufts at the end of their tails. Any lion not rampant may heraldically be called a "lion leopardé." Golden lions on a red ground are "langued and armed azure;" that is to say, they have blue tongues and blue claws.

Edward seems at first to have used the English coat before that of France, as Howes in his "Chronicle" says that, "Touching the title and armes aforesaid, the French king (Philip VI.) said to certain English men sent to him, 'Our cousin,' quoth he, 'doth wrongfully beare quartered the armes of England and France, which matter notwithstanding doth not much displease us, for that he is descended from the weaker side of our kin, and therefore as being a bachelour we would be content to grant him license to bear part of our armes of France. But whereas in his Seals and Letters Patents he nameth himself as well King of England as of France, and doth set the first quarter of his arms with Leopards, before the quarter of Lilies, it doth grieve us very much, making apparent to the beholder that the little island of England is to be preferred before the great kingdom of France.' To whom Sir John Shoreditch, Kt., made answer, 'That it was the custom of men in those days to set the title and arms of their progenitors before the arms and title of the right descending of their mother, and thus of dutie and reason doth my Lord the King prefer his arms.'"

Nevertheless, the protest of the King of France found favour in Edward's eyes, and he and his successors, until the time of William III., allowed the arms of France to remain in the first quarter.

We are told in manuscripts (Harl. 1073 and Harl. 304) that Edward III. used as supporters a crowned lion guardant, or, and a falcon, or, but I expect these were only badges. Badges did, however, in many instances suggest supporters.

Richard II. used the same coat, and there is a sculptured coat-of-arms of his at Westminster Hall, beneath which is the badge of a white hart, the cognisance of his mother, Joanna of Kent. Richard married Isabella of France, whose father, Charles VI., reduced the lilies semées of France to three only. Henry IV. at first used the lilies semées, but in 1408, in his great seal, he reduced them to three (the lilies semées are known as "France ancient," and, when there are only three, as "France modern"), and this coat, "quarterly 1st and 4th, France modern, 2nd and 3rd, England," remained unchanged until the time of James I.

Henry V. is credited with having a lion and an antelope as supporters, but over his tomb at Westminster he has an antelope and a swan. But still I think these are only badges.

Henry VI. shows the coat upheld, in a coloured-glass window at Ockwells House, Maidenhead (the exact date of which I do not know), by two white harts, derived no doubt from the badge of Richard II.

Now I find a new authority for royal coats-of-arms. Hitherto I have derived them chiefly from seals, but from Edward IV. until Victoria (with the exception of Edward V.) there is a splendid series of royal coats-of-arms on, or in, books which belonged to the sovereigns themselves.

At Westminster there is a loose cover of a book which bears the impression of a panel stamp showing the arms of Edward IV., supported by two lions, ensigned with a crown held up by two angels. Also in a manuscript (Bib. Reg. 15 E. 4) which belonged to the king is the same coat and the same supporters. The white lions are doubtless derived from the white lion badge of the Mortimers, Earls of March, ancestors of the king. Willement says Edward V. had a lion and an antelope as supporters, but I cannot find any authority for this. He had no great seal.

The Yorkist badge of a silver boar is carved on the steeple of the church at Wolverhampton, and silver boars, armed or, were undoubtedly used for supporters by Richard III., and are shown in a manuscript which belonged to him. (Bib. Reg. 18 A. 12.)

On another manuscript (Bib. Reg. 16 F. 2), formerly the property of Henry VII., is his coat-of-arms with the same two white lions as supporters, but a little later he changed them and adopted a red dragon, supposed to have been the badge of his ancestor, the Welsh prince Cadwallader, as his dexter supporter, and a white greyhound as the sinister supporter. The white greyhound was a badge both of Henry's ancestors the De Beauforts, and of his wife's ancestors the Nevills. Henry VIII. used the same supporters until about 1528, when he gave up the greyhound and moved the dragon to the sinister side, adopting a lion as his dexter supporter.

Edward VI., Mary and Elizabeth all used the same coat and the same supporters, but Elizabeth on one of her great seals used for the first time the harp of Ireland. It also shows in a painting of her coat-of-arms (Harl. 6096), as does also the coat-of-arms of Wales.

Ireland has at various times enjoyed a separate coinage from that of England, and an issue of silver groats of Henry VI. have on the obverse a single crown, no doubt intended for a badge or possibly coat-of-arms. A little later in the reign of the same king appear, also on a silver groat, "three crowns in pale," this time no doubt used as a heraldic bearing. This coat was afterwards declared to be the coat-of-arms of Ireland on the authority of a commission appointed by Edward IV.

Henry VIII., however, seems not to have approved of the three crowns in pale, and on an Irish sixpenny piece of 1530 shows a single crowned harp as well as the title "Hibernie Rex." Walker, in his "History of Irish Bards," says that Henry bestowed the harp upon Ireland as a coat-of-arms in token of his appreciation of her feats in music. From this time the single harp shows constantly, but on a shilling of Elizabeth, dated 1560, there are three harps, two and one. Vallency says that the Irish harp was sacred to Apollo, Grian or Beal, and in the MS. Harl. 304, we are told that "the armes of Yrland is Gules III. old harpes or, stringed argent." The shield of Ireland is, however, now shown azure—as it is in Harl. 6096, mentioned above. The coat-of-arms of Dublin is three castles, and the triple arrangement here, as well as in the case of the crowns and the harps, may have some connection with the ancient triskele, found in perfection in the shamrock, and like the four-armed swastika, one of the most widely spread of early decorated designs.

The coat-of-arms of Wales, "quarterly, or, a lion statant gules counterchanged," which shows also in the same MS. Harl. 6096, is really that of South Wales; the coat of North Wales, which shows on the hilt of the State sword of Prince Edward, afterwards Edward V., is "or, three lions passant reguardant in pale, gules, their tails passing between their legs and reflected over their backs." But the coat of South Wales is generally considered to represent the whole country.

The coat-of-arms of Scotland appears first in the seal of Alexander II. in 1235. It shows continually on coins, and the lion, now truly rampant, is said to have been derived from the arms of the Earls of Northumberland and Huntingdon, ancestors of Scottish kings. The tressure with the fleurs-de-lys is said to have been adopted in compliment to Charlemagne, between whom and King Achaius of Scotland there was a treaty—and a later treaty added the second tressure, but this is all conjectural.

The Scottish supporters as used by James I., in 1429, were two lions rampant guardant, but James IV. is said to have adopted two silver unicorns, royally gorged and chained, or. One of the Scottish kings, as prince, had some hand in the death of his father, and he wore the chains which are immortalised on the unicorn of Scotland ever afterwards.

When James VI. of Scotland inherited the kingdom of England, and came here as our James I., he made an important change in the royal coat-of-arms. In the first place he used the coat of "France and England quarterly," which had been used by his predecessors, repeated in his first and fourth quarters, then in the second quarter he put his own ancient Scottish coat, and in the third quarter the harp of Ireland. Not only this, but James abolished the red dragon of Wales, used as a sinister supporter by the later Tudors

Digitized by Google

and substituted for it one of the Scottish unicorns. This same coat and supporters was used by Charles I., Charles II. and James II., and the supporters have remained the same until the present day.

Cromwell used the cross of St. George in his first and fourth quarters, the cross of St. Andrew in the second quarter, and the harp of Ireland in the third quarter, and over all in an inescutcheon the lion rampant of the family of Cromwell, and the later Tudor supporters, lion and dragon.

William III. was born Prince of Orange, and had for his coat-of-arms quarterly, Nassau, Dietz, Vianden and Catsenelboge, over all Chalon, Orange, Geneva and Buren. When he came to England he used the same coat as James II., but with the arms of Nassau, his original first quarter, "az., semée of billets, a lion rampant, or," in an inescutcheon. William also in many instances altered the order of the quarterings of the royal coat-of-arms.

Queen Anne in the early part of her reign used the same coat as her father, but on the legislative union of England and Scotland in 1706 (March 6) she made an important change. The coats of England and Scotland are now impaled and used on the first and fourth quarters, France is relegated to the second quarter, and Ireland remains in the third quarter. This coat remained in force until the accession of George I.

Before George I. came here he was Duke of Brunswick and Elector of Hanover, and had an elaborate coat-of-arms, ensigned with the electoral bonnet. This coat contained the arms of Brunswick, Saxony, Luneburg, Eberstein, Osnaburg, Homburg and several others, with the crown of Charlemagne on an inescutcheon. When he came to England he omitted the existing fourth quarter of the English coat-of-arms, and substituted for it a representative coat for his dominions in Germany, namely, "Brunswick impaling Luneburg, Saxony in the base point and the crown of Charlemagne, in an inescutcheon of pretence, as a badge of the office of Arch-Treasurer of the Holy Roman Empire. This actual crown is now kept in the royal treasury at Vienna. It is the finest Byzantine crown in the world. This coat-of-arms was used by George II. and by George III. until 1801, when, on the legislative union of Great Britain and Ireland, the lilies of France and the title "Rex Franciæ" were discontinued, and the Hanoverian coat was put in the centre of the coat-of-arms on an escutcheon of pretence, ensigned with an electoral cap, the coat of England being alone in the first and fourth quarters, Scotland in the second and Ireland in the third.

On the elevation of Hanover to the dignity of a kingdom in 1814, a new seal was designed, and on the fifth great seal of George III., issued on August 1, 1815, the electoral cap above the escutcheon of Hanover was changed into a royal crown.

George IV. and William IV. both used the same coat-of-arms, but on the accession of Queen Victoria the escutcheon of Hanover was discontinued, that kingdom, by virtue of the Salic Law, passing to the Queen's uncle, Ernest, Duke of Cumberland. Hanover was annexed to Prussia in 1866. Edward VII. uses the same coat as Queen Victoria. The present official coat-of-arms of Scotland is quarterly first and fourth Scotland, second England and third Ireland, within the collar of the Order of the Thistle. Dexter supporter a unicorn and sinister supporter a lion, each holding a spear with the national flags bearing the crosses of St. Andrew and St. George respectively. The crest is a lion sejant affronté on a royal crown, holding in his dexter paw a sword and in his sinister paw a sceptre, and above is a scroll bearing the words "In Defens."

To-night I have only considered the coats-of-arms of our actual sovereigns; I hope, on a future occasion, to have the privilege of telling you something about the coats-of-arms of royal consorts, Princes of Wales and also about the many royal badges.

The chairman (Mr. W. A. Lindsay, K.C., Windsor Herald) was sure the members were deeply indebted to Mr. Davenport for his paper and for the beautiful illustrations he had given of the various coats of arms borne by the sovereigns of this country. With reference to the early connection of England with Aquitaine, it was not uninteresting to observe and it might possibly have some bearing on the arms used by early England, that both Aquitaine and Normandy were formerly represented at the coronations of British sovereigns by two special officials. Down to quite recent times two persons representing the two Duchies of Normandy and Aquitaine had always taken part in the coronations of British kings. With regard to Edward IV. being the first person to use supporters, he quite accepted the statement that no illustration of such supporters could be found or was easily to be produced, but that kings of England did have supporters long anterior to Edward IV. was, he thought, proved by the fact that all the great earls had supporters. There existed seals of a number of earls, both of England and Scotland, for a period of a hundred years before Edward IV., and they all had supporters beautifully engraved. Most of those seals were supposed to have been made in Italy. With regard to Oliver Cromwell and his very ingenious device, which was no doubt intended to obliterate heraldry as much as possible, the author made one remark from which he (the Chairman) wished to differ, namely, that Oliver Cromwell descended from the Stuarts. The fact was that Oliver Cromwell did descend from a family of Stuarts who lived in the East of England, who attempted to prove and induce certain heralds to record that they descended from the kings of Scotland; but the whole pedigree was absolutely spurious, and it had been disproved long ago. As regards the heraldry of Queen Anne, he would like to suggest to Mr. Davenport that the arrangement of putting England and Scotland in pale in the first quarter was a beautiful illustration of the accuracy of heraldry, because what really happened in the year 1706 was that both England and Scotland came to an end; they ceased to be separate kingdoms, and from that moment there never was an England and there never had been a Scotland—they became the kingdom of Great Britain. Therefore, the putting of England and Scotland in pale in the first quarter represented that those two countries were married. Of course, that arrangement could not be continued when a further marriage took place, and therefore, when the union between Great Britain and Ireland occurred it became necessary to go back to the former system of quartering; but the original idea of putting England and Scotland side by side, impaled, was a beautiful illustration of the idea that the two countries were married and had contracted an indissoluble union.

TESSERÆ.

Ancient Athens.

AS to the real extent of Athens, it is certain that the ramparts, sixty stadia, or nearly seven miles in circumference, exceeded much what would have been necessary had the nation in time of war possessed any other place of refuge. On such distressing occasions inhabitants from the country, who had no dwellings, constructed in the openest places a number of huts, resembling in figure the hives of bees. Aristophanes, who had seen these miserable sheds during the Peloponnesian war, compares them to those earthen urns, called casks, which were in use among the Greeks. All these circumstances took place previous to the days of Diogenes the cynic, whose history, written without judgment, has been read without reflection. Exclusive of those dwellings, erected for the moment, all the houses in Athens did not exceed 10,000, according to Xenophon; and thus the total number of inhabitants may be determined at 50,000, including both slaves and strangers. It would be absurd to imagine a more numerous population where the dimensions of the buildings were so inconsiderable and their value in general so trifling that the smallest lodging in any of the great towns of Europe could not be purchased on the same terms. In perusing the Greek orators, who had such frequent opportunities of appraising estates and inheritances, it appears that the value of a house in Athens was generally about half an attic talent, or ninety pounds sterling. Numbers of them, however, could not be sold even for that sum, as may be judged from what Dicearchus has recorded of their mean appearance. It has been necessary to begin these discussions in order to fix the ideas of the reader on the most interesting points of the history of Athens, and every person must now perceive that neither Pericles nor any other demagogue as powerful as he could ever succeed in transforming this capital into a beautiful town. The excess of magnificence displayed in the temples and public edifices of Athens rendered the wretchedness of the private buildings more conspicuous. The eye was carried rapidly from one extreme to the other without finding anything intermediate whereon to repose, and this evil, instead of diminishing, became constantly more prevalent. As no connection or proportion subsisted among the parts it was impossible that the whole could produce any beautiful effect. The 3,000 statues erected in the public places and under the

Digitized by Google

porticoes of Athens did not conceal the deformity of the streets, because a profusion of ornaments can never compensate for misery.

Henry Cole and Architecture.

Cole had for the work of his life the advancement of what we have been accustomed to call the minor arts, and there can be no doubt that he began upon the basis of a personal dislike to the professional practice of architecture, which he maintained to the end and bequeathed to his successors. Rightly or wrongly, he seems to have arrived at the conclusion that the architect was a fossil, whose function in the streets of ancient Rome, or in the cloisters of Mediæval abbeys or in the market-places of modern but not too modern Italy had no doubt been a useful function judging by the remains of his performances, but who in modern London was a doer of nothing to speak of, or of nothing but what could be done quite as well without him. As matter of business, we know this to be mere folly; there is perhaps nothing in the work of this world which the untrained intelligence can never hope to accomplish if the proper design of a high-class building be not such a thing, and the continual endeavour of uninformed persons to do their own architecture, in spite of a thousand failures, is only evidence, indeed, of the fascination of the unattainable. Cole, however, seems never to have permitted himself, as so many do, to be an amateur architect, or even to have encouraged any one else to be so; what he underrated was not art, nor even business, but men. His own soul was wrapped up in detail, and he found the architects, as he thought, to be devoid of the knowledge of such detail, and content to trade upon a little experience merely in the drudgery of supervising building contractors. When he fell in with an architect like Digby Wyatt, who knew all that he himself knew, or could wish to know, of the arts of detail, and who knew also that which he acknowledged to be beyond his own reach—the whole volume of the historical art of splendid building—he could honour him, and did honour him as far as was convenient; but if the mere art of building without the arts of detail were alone in question his opinion was that the Royal Engineers could manage that quite as well as any one need desire, and indeed all the better because of one thing, that they were soldiers under discipline, and not like a good many architects he could name who were not under discipline, and whose successors, if we must tell the truth, are not under discipline yet. The fact that the Prince Consort had built Osborne in 1848 without employing an architect (although the builder, of course, employed one) may have been encouraging to him.

Assyrian Vaulting.

The vault was supreme in certain parts of the buildings of Chaldea and Assyria. Its use was there so constant as to have almost the character of an unvarying law. Every palace was pierced in its substructure by drains that carried the rain-water and the general waste from the large population by which it was inhabited down into the neighbouring river, and nearly all those drains were vaulted. And it must not be supposed that the architect deliberately hid his vaults and arches, or that he only used them in those parts of his buildings where they were concealed and lost in their surroundings; they occur also upon the most careful and elaborate façades. The gates of cities, of palaces and temples—of most buildings, in fact, that have any monumental character—are crowned by an arch, the curve of which is accentuated by a brilliantly coloured soffit. This arch is continued as a barrel vault for the whole length of the passage leading into the interior, and these passages are sometimes very long. Vaults would also, in all probability, have been found over those narrow chambers that are so numerous in Assyrian palaces were it not for the ruin that has overtaken their superstructures. Finally, certain square rooms have been discovered which must have been covered with vaults in the shape of more or less flattened domes.

J. Russell, R.A.

When we try to estimate Russell's power and rank as an artist the comparison with Sir Joshua and Gainsborough forces itself upon us. Nevertheless, the divergence is far more real and striking than the resemblance. In looking at Reynolds we can never forget that he has lived with the greatest. His own resources may be inferior to theirs, but he has learnt his dignity and ease of manner in their company and in their school. He knows exactly how a great master would be expected to behave in a difficulty. He feels instinctively where Titian would have been bold or Correggio subtle. Gainsborough, on the other hand, has none of this elaborate finish of breeding and training. He is a self-made man. In the consciousness of his superb facility he disdains the roundabout contrivances of learned art, nourished upon maxims and memories. With him the shortest is also the easiest way, and his masterpieces, unlike those of his more deliberate and self-conscious rival, have all the appearance of being the natural result of some occasional harmony of mood and model. In Russell we have less art, but more of truth than in either of his great predecessors. We use the word truth, of course, in a restricted sense. He never reached that higher level on which, as in the case of the *Johnson* and the *Heathfield*, the real and the imperishable have, as it seems, already begun to shine out in the light of immortality; but, on the whole, his transcripts are more faithful than the average of either Reynolds or Gainsborough. He was ignorant of the conventions of the grand style which led the aspiring President to generalise his subjects, while the careless audacity of Gainsborough was equally remote from his character of earnestness and sobriety. Men are saved by their limitations more often than they are apt to think—certainly than Russell himself would ever have allowed.

The "Raising of Lazarus."

In that grand picture by Sebastian del Piombo in the National Gallery, what a group of fine faces are introduced, the expression of each of which is subdued to the nature of the event embodied. Here, however, the principal figure of Christ is the least expressive, and the group of Lazarus (said to have been designed by Michel Angelo) becomes of the first importance, and gives the tone of expression to the rest of the picture. The principal figure in the composition is not nor need always be the key to the expression of the whole picture; the necessity for that depends upon the nature of the event and the mode in which it is treated. In this picture, for instance, the wonderful greatness of power in the worker of the miracle is merged in the marvellous consummation of the miracle itself, the minds of the persons who view its accomplishment are bent on the strange and horrible sight, and curiosity blended with amazement and terror is the ruling passion in their breasts at this precise moment of time. Had our Saviour been represented in the act of pronouncing the words "Lazarus, come forth," then the eyes and feelings of the multitude would have been properly directed to Him, and His look would have been the key to the expression of the picture; but as it is, Christ at the precise point of time described in the picture is a secondary personage. After the wonder and curiosity of the people have subsided by beholding Lazarus alive, then their attention becomes directed again to Christ, with an internal feeling of settled wonder and reflection succeeding to amazement, terror and curiosity. In this way ought historical pictures of events to be viewed both by the artist who paints and the spectator who contemplates them. A painter can only represent one moment of time, and that precise moment of time should be clearly defined before he finishes the invention of his picture. He may conceive the scene at various points of time, as well as in various points of view and in various modes of representation; but having made his election, he should rigidly adhere to the exact turn in the event, or else there will be wanting that unity of purpose in the expression and action which is so essential to a perfect picture, and to its producing a true and vivid effect upon the mind. By means of accessorial figures and expressions and episodical circumstances, an epic character may be given to the pictorial representation of the event without those anomalies which we sometimes see in the works of the old painters, where an event is represented in more than one point of time in the same picture, like two scenes represented on the stage at one time.

Otho Venius.

It has been the fate of Otho Venius, the master of Rubens, like that of many others, to have his name and memory merged in the fame of his pupil. It was from this master that Rubens formed his style and his taste, more especially in subjects of allegory. Nothing can exceed the fertility of invention in the subjects which come under the pencil of Otho Venius. His designs embrace the abstruse and the metaphysical, and his personifications extended not only to what came under the view of the senses, but to those which more properly belonged to the imagination and understanding. It cannot but be imagined that forms thus derived must have been in many instances far-fetched and

Digitized by Google

absurd; but there was such a redeeming quality in his groups and compositions—so rich a vein of fancy and luxuriance of genius—that his anachronisms and errors may well be overlooked in the variety they afford. The designs of Otho Venius for the "Life of St. Thomas Aquinas," and also for his "Divine and Love Emblems," with his "Illustrations of Horace," are a fund from which the artist and the amateur may derive both instruction and delight. His style, which was followed in great measure by his pupil, had more of the German than the Italian school, but was less pedantic and extravagant than the former. A portrait of Otho Venius is introduced by Rubens in his celebrated picture of *The Woman taken in Adultery*, and is conspicuous among the group from his bald head, white beard and benevolent aspect. The original study of this head was in the possession of Dr. William Hunter, and was removed, along with others in his collection in Windmill Street, to the College at Glasgow. This study is a more animated example of character and expression than that of the painting alluded to, where it is represented with a calm, compassionate countenance; while in the study it has all the dignity of the prophet combined with the fire of genius. Such was the master under whose forming hand the future pencil of Rubens attained a height and splendour which eclipsed the name and fame of his preceptor, clearing for himself a path to honour, preferment and employ such as few beside himself ever enjoyed.

GENERAL.

The Duke of Norfolk is to receive at Norfolk House today, the 27th inst., the monstrance, for use in the services at Arundel Roman Catholic church, of which we published an illustration on March 30.

Mr. Justice Grantham has been elected chairman of the Barcombe (Sussex) Parish Council.

Professor Flinders Petrie will begin a course of lectures on "Recent Discoveries in Egypt" on May 10 at 3 P.M. in University College, London. Mr. T. G. Pinches will deliver two public lectures on "The Assyro-Babylonian Antiquities in the British Museum" on May 24 and 31 at 4.30 P.M.

Mr. W. L. Wyllie, A.R.A., is engaged in painting a number of large panels to ornament the new volunteer drill hall at Chatham. The panels depict war scenes.

A Set of seventeenth-century Flemish "verdure" tapestries, recently acquired at great cost by Lord Ninian Crichton-Stuart, has been hung on the walls of the Chapel Royal in Falkland Palace. The complete "room" of tapestry came from an old house in Maarssen, Holland, which was built in 1400. The set of tapestries comprises six pieces, the largest of which measures fully 24 feet long by 9 feet high, and represent forest scenes.

H.R.H. Princess Christian will open the new National Nautical School at Portishead on May 5. Mr. Edward Gabriel, the architect, will present to the Princess a key which was made by the Bromsgrove Art Guild.

Messrs. W. S. Weatherley & Francis E. Jones, architects, have removed from 30 Cockspur Street to 2 Haymarket, corner of Suffolk Place.

Mr. Hodgson Fowler, of Durham, after an examination of Bakewell Church, has recommended the renewal of all the tie-beams, except one which dates from the fifteenth century, and, in fact, of most of the woodwork; also the recasting of the lead in smaller sheets, the relaying of the gutters in cement, and the rearrangement of all down shoots. The new tie-beams have been cut out of oaks brought from Holton Park, Oxfordshire, and Mr. Hodgson Fowler estimates that the new roof will last 200 years. The total cost of the work will be about 2,000*l.*

The First Volume of "Simpson's History of Architecture" was issued without an index. One has now been prepared, and can be obtained gratis from the publishers, Messrs. Longmans, Green & Co., 39 Paternoster Row, London, E.C.

The Society of the Architects of France have arranged that the subject of this year's competition, which is the fifteenth, shall be a railway station for a town having from 8,000 to 10,000 inhabitants.

The International Committee of Assessors, in the competition for the Temple of Peace to be erected at The Hague, have received 217 entries comprising more than 3,000 drawings. It is expected that the plans will be exhibited in June.

Mr. R. T. Longden, of Moorland Road, Burslem, has been successful in the competition for the Congregational chapel and Sunday school, Stoke-on-Trent.

Mr. Hippolyte J. Blanc, F.R.I.B.A., 25 Rutland Square, Edinburgh, is the architect for the hall to be erected at the Edinburgh Asylum, at a cost of 5,000*l.*

The Late Mr. James MacLellan Blair, who died at Linlithgow last week, was one of the best known representatives of the ironmasters and constructional engineers in Scotland. In 1873 he became a partner in the firm of P. & W. MacLellan, and he carried out contracts in various parts of the world. On the conversion of the firm into a limited liability company he became one of the directors, a position he held until his death. As a magistrate he rendered much service from his ability, fairness and sympathy. His loss will be greatly deplored.

The Restoration of the large west window of York Minster has been completed, under the superintendence of Mr. R. C. Green, the clerk of works. The original stained glass has not been interfered with, but the old plate glass which was put outside to protect the stained glass was taken out and the mullions and tracery of the window carefully restored. The exterior has been entirely reglazed with lead glazing, 958 superficial feet of glass being used in the work, namely, 598 feet up to the springing and 360 feet in the tracery. The old outer plate glass was put in some fifty years ago, and when it was removed it was found that there was only one panel which was intact, all the others having been cracked or fallen out altogether. The glass had been fixed into the stone mullions, which prevented it giving with any vibration of the building, which caused it to crack. This is obviated by the lead glazing.

The Society of Antiquaries have elected its officers and members of the Council for the ensuing year:—Lord Avebury (president), Viscount Dillon, Sir Henry H. Howorth and Sir Edward M. Thompson (vice-presidents), Mr. Philip Norman (treasurer), Mr. F. G. Hilton Price (director), Mr. Charles H. Read (secretary), Lord Balcarres, M.P., Sir Edward Brabrook, Sir Owen Roberts, Messrs. J. Willis Clark, L. H. Cust, J. W. Willis Bund, William Dale, G. E. Fox, Everard Green (Rouge Dragon), Hubert Hall, A. G. Hill, A. B. Skinner and H. R. Tedder.

Mr. J. Morley, M.P., has made the following official statement with reference to the Indian Public Works Department:—"So long as the Royal Engineering College at Coopers Hill is open, natives of India have been able to obtain appointment to the Public Works Department of the Government of India from this country to the extent of two appointments a year. The ten additional appointments which will be made from the open market this year have been restricted to Europeans, because Coopers Hill College is still open, and that mode of access was open to Indians desiring to enter the Department during the current year and in 1907. In 1908 and after, when the whole of the recruitment will be direct from the open market, it has already been announced by my predecessor that natives of India may be recruited in this country up to 10 per cent. of the total number appointed."

The Grantham Town Council held a special private meeting for the purpose of appointing a successor to the late Mr. F. J. Morris, the borough surveyor. There were 210 applications, and a special committee reduced this number to five, namely, Mr. William Shackleton, of Hanley; Mr. Henry Raven, Ilkeston; Mr. D. J. Bowe, Eastbourne; Mr. A. Norman Hudswell, Woolwich, and Mr. Harry O. Jones, Folkestone, and these were interviewed by the Council. The final vote was taken between Mr. Shackleton and Mr. Raven, and the result was the appointment of the former. Mr. Shackleton is thirty-two years of age, married, and has had seventeen years' experience. The salary is 180*l.* per annum, rising by 10*l.* yearly to 250*l.*

In their Report for the year ended September 30 last, the Commissioners of the Board of Trustees for Manufactures, &c., in Scotland say:—"It is with great gratification the Commissioners have to report the unprecedented success of their advanced students in the competition for the awards of royal exhibitions and national scholarships, open to all art students in the United Kingdom. Out of ten royal exhibitions awarded three were gained by students of this school, viz. the fourth, fifth and tenth places. Only six national scholarships are awarded each year, divided between the four groups of art study, viz. design and ornament, architecture, modelling, and drawing and painting, and three students of this school were placed first, second and third in the modelling group. In addition to these, the highest awards, two local scholarships and one free studentship at the Royal College of Art, also fell to the share of this school."

The Architect.

THE WEEK.

THE decision which was given on Monday in the Divisional Court by the Lord Chief Justice, Mr. Justice RIDLEY and Mr. Justice DARLING suggests the limitations of local authorities. The case arose out of the expenditure of 3,050*l.* on the Madeira Road, Brighton, by the Corporation. An application was made by a ratepayer to have the orders for payment quashed. The existence of Brighton depends on the influx of visitors, and it is supposed to be the business of the Corporation to attract them by having the place in the latest style. But the law does not recognise any extraordinary outlay with that object. The Madeira Road was in as good a condition as any other in the town. In 1897 it was proposed to try the experiment of laying down tar-macadam on it at an extra cost of 1,000*l.* But the Corporation declined. In 1904 the Automobile Club proposed to have trials or races on the Madeira Road, and in the expectation that Brighton might be made the annual place of meeting it was decided that tarmac, which is a variety of tar-macadam, should be employed. It was supposed to have one advantage in the absence of dust and mud, and another in the rapidity with which the surface dried after rain. In order to carry out the operations the road was closed to general traffic, and the public were also to be excluded while the races were in progress. Application was made after the commencement of the works to the Local Government Board for authority to raise the money. It was refused on the ground that the road was in good condition, and that the new works were only intended to provide a surface for motor trials. The work was done, and as the orders for payment have been quashed by the Court it is difficult to discover from what quarter the money is to be obtained. The Corporation went beyond the authority which they could exercise under the Public Health Act, and they must now accept the consequences.

LAST year there was surprise when the Government report was published concerning the condition of the habitations in Lewes. Apparently not the least improvement has been accomplished. According to the report of the medical officer of health, there is an excessive number of deaths from consumption and other tuberculous disease, and especially from infectious disease. But how is a remedy to be found? The report says:—"The proprietor of the island, though willing, cannot build some thousands of clean and comfortable cottages from his own purse, already drained to the utmost by poor and school rates. It has been said that the local sanitary authority should do its duty and compel these poor people to conform to twentieth-century notions as to the propriety of dividing the human and bovine elements. I lately visted Arnol with this point chiefly in view, to find that this separation meant next to no real sanitary improvement, that it was impossible to drain Arnol without moving almost every house away from the muddied hollow in which it lies, rebuilding it on the higher ground adjacent, and finally digging a deep and expensive ditch through the rock to carry off obnoxious liquid matters." The inhabitants have to depend mainly on fishing, and there is no money. They cannot contribute towards the cost of improving their dwellings. The island must be considered as one of the blots on civilisation, and as the survival of manners and customs almost prehistoric.

IT is a common belief among those who have only a superficial knowledge of American ways that there is a good deal of "leakage" in all contracts with the Government which the taxpayers have to endure. Contracting is supposed to be closely connected with election engineering, and all adjuncts of a similar class entail expenses which ultimately must be paid out of the public revenue. From time to time reformers arise who profess their resolution to put a stop to such malpractices. But such men generally discover that their tenure of office or influence is of short duration. Some time ago it was decided to make an example. Actions were taken against three contractors for embezzlement and for making claims for payment for work which had not been executed. The United States retains many of the principles of English law, and among them is a belief in the advantage of lengthening out proceedings. It therefore required no less than seven years action and an outlay which is estimated at 20,000*l.* to bring about a conviction. Two of the defendants were convicted, and each was sentenced to four years' imprisonment and a fine of about 115,000*l.* The judgment will suggest the magnitude of the operations, which must have been on a scale befitting the greatness of America. No one believes the sentence will be carried out in its entirety. By showing signs of contrition the length of the imprisonment can be greatly reduced, and it is only necessary for the men to make affidavits that they are poor in order to be relieved from the fine. Sanguine Americans, however, believe that the result will be a warning.

ALTHOUGH exploration in Egypt is carried on by British and foreign societies as well as individuals, Lord CROMER is not neglectful of the subject. There are now four inspectors in the Antiquities Service. During last year good work was done. Several statues, some of which are of great value, were discovered at Karnak. Much is anticipated from the excavations at Sakkarah. A very large tomb belonging to one of the PHARAOHS of the earliest dynasties was opened at Zawiet-el-Aryan. An American gentleman, Mr. DAVIS, has discovered the tomb of the father-in-law of AMENHOTEP III. at Thebes. It contained a collection of very beautiful objects, which have been all transported to the Cairo Museum. M. MASPERO has prepared an estimate of the cost of consolidating and repairing the different monuments in Nubia. He reports that at Philæ all continues to be satisfactory, and that all immediate danger appears to be overcome. The quantity of saltpetre has been diminished and is removed more easily than formerly. The great catalogue of the museum has made considerable progress. Nine volumes appeared last year, bringing the total published since 1901 up to fifteen. M. MASPERO thinks that the work of compilation may be completed in three years time, and that of printing in six years. Money has been expended on the preservation of Arab monuments, including the Sultan Harsan Mosque, the restoration of Coptic churches. Both the Government and the Coptic community are said to be indebted to Mr. SOMERS CLARKE for calling attention to the condition of the monasteries at Sohag.

THERE was a fear that Trentham Hall, which was the gift of the Duke of SUTHERLAND to Staffordshire, would become a sort of white elephant, for it was not adapted for a technical college as the donor suggested. The Director of Education for the county has been asked to report upon the building, and he suggests that it might be used as a training college for women teachers. It has yet to be ascertained whether the Duke of SUTHERLAND will agree to the change. The county medical officer of health has to recognise that many of the sanitary defects connected with the building arise solely from the inadequate means of sewage disposal. The sanitary authorities, however, above Trentham are now engaged in the construction of sewage disposal works, and it is anticipated that within two years the nuisance will be removed. It will therefore be seen that no definite resolution has been taken about the future of the building.

ARCHITECTURE AT THE ROYAL ACADEMY.

THE oldest and most regular visitor to the exhibitions of the Royal Academy must acknowledge that he never saw such immense drawings as appear this year in the Architectural Room. It might be imagined that certain architects were advised to exceed the customary dimensions. If justice is to be done to buildings they should be represented on a scale which allows of a scrutiny of all the details. But if the foreign architects, who are expected to visit London in a couple of months, should be attracted to the Academy, they are sure to wonder why their art, for which admittedly large size drawings are necessary, should be "cabin'd, cribb'd, confin'd," within so small a room. They will also be puzzled to discover why some buildings, parts of buildings, and even objects to be used in them, should be presented on a large scale, while no less important buildings are drawn to a size which can only be suggestive of their general effect. To anyone who is familiar with the Architectural Room the walls recall topsy-turveydom, but strangers may believe there is nothing exceptional in the aspect, and that architects must occasionally suffer from the whims of officialdom. It is certain that the owners of rejected drawings which were of the ordinary sizes will have less reason to regret their absence from the exhibition than on other occasions, for owing to the arrangement adopted the attention of visitors is likely to be given to those views alone which are remarkable for their size or manner of treatment.

Fortunately, the majority of the buildings which appear on large drawings are well deserving of notice. Architects will be glad to see that once more Mr. NORMAN SHAW is the contributor of no less than five of the drawings of the class to which we have referred. He has been so long absent from the exhibition that his latest works will be welcomed not only for the sake of the author, but for their treatment. We may even go so far as to say that if those relating to the Regent Street improvement are carried out, they will make a beginning of a new era in London architecture. The view of his "Alliance Insurance Office, St. James's Street," will of course recall to visitors Mr. NORMAN SHAW's insurance office at the Pall Mall corner of the street. The earlier indicated an approach towards Classicism, but the later design shows a building that can be considered as Italian. It is one among many proofs of the hold which Italian rather than Flemish precedents are gaining on the architectural mind. The designs for the Piccadilly Hotel, which were prepared for the Office of Woods, and the different views of the Quadrant, which were also inspired by the same authority, are enough to make JOHN NASH disturbed when he thinks of the opportunity he lost. He was controlled by cheapness and flashiness. But since the days of the Regency London has increased in wealth, and investors in building can be compelled to accept an expenditure which at one time would be impossible. It would, however, be interesting to have the report of a committee of Regent Street shopkeepers on the designs. They would not be unlikely to maintain that although the new buildings would serve for insurance offices, they are not adapted for the requirements of trade. It will no longer be possible, if the designs are adopted, to have it appear that the shop-front is everything, and that it mattered little whether, constructionally or financially, the upper part of the premises were supported by a signboard and a large plate of glass. Mr. NORMAN SHAW would substitute an arched construction in the ground floors of all the premises in the Quadrant. The Office of Works can insist on the arrangement. If obeyed, it might not be prejudicial to the shopkeepers' interests, and if so, we should then expect, as we have said, to witness a change which would be revolutionary.

Sir ASTON WEBB sends a "Detail Elevation of the New Admiralty Building at the East End of the Mall." This is admirably treated, and without any apparent straining becomes a memorial of NELSON, whose memory merits recognition in such a building. Another work of the architect is "New Almshouses at the Hendre, Monmouth." But the most important is the view of "The New Royal College of Science and Government Offices in Dublin," by Sir ASTON WEBB, R.A., and Mr. T. M. DEANE. The buildings are arranged around a square, and the two entrances are of a different character. One opening on Merrion Street is an interesting composition. The doors are flanked by figures in niches and the upper part has a cupola conferring dignity on the block.

The competition for the Wesleyan Methodist Central Hall, Westminster, is recalled by several designs from Messrs. CROUCH, BUTLER & SAVAGE, Mr. J. A. SWAN, Messrs. RÜNTZ & FORD, Mr. E. VINCENT HARRIS (2), Messrs. MALLOWS & CROSS and Messrs. LANCHESTER & RICKARDS. The instructions in this case were precise, and like tenders from well-arranged and explicit quantities, there is more or less resemblance between them. Mr. H. T. HARE shows a large sheet of details from the Central Library at Islington, the windows being flanked by unfluted Ionic columns. His "Premises for the U.K. Provident Assurance in the Strand" have a liberal use of figure sculpture on the pediments and elsewhere. The "High Bay of Choir, Liverpool Cathedral," by Mr. GILBERT SCOTT, is of immense size. The stone employed is of a rather gloomy colour, and if it were not for the greenish-blue light of the windows the effect would be still more solemn. The windows are remarkable for breadth rather than height. But the area for lighting will no doubt be adequate. The boldest experiment in church work is "A Steeple Leaded," by Sir C. A. NICHOLSON. The walls of the church are supposed to be of red brick, which offers a marked contrast with the lead on the spire and pinnacles. As the lead is cut out into patterns there is no monotony or heaviness. By the same architect is the new "Parish Church, Epsom," which somehow produces the effect of one that has gone through a series of transformations and had a history. The fine design for "Municipal Buildings, Law Courts and Town Hall, Bournemouth," by Messrs. MALLOWS & LACEY, is again on view, and again will receive general admiration. The "Royal Exchange Buildings," by Messrs. GEORGE & YEATES, are shown on a coloured drawing. It is a concession to modern city requirements, but neither in the drawing nor in the design can we recognise the old spirit which was for so long almost dominant in the Architectural Room.

One of the remarkable drawings of this year is "A Design for a Town Mansion, with Surroundings," by Mr. J. A. SLATER. This is a veritable painting, and in any other year would impose itself on the attention. Now it has rivals, although they may be less pictorial. The mansion would be adapted to Spain, but anywhere it would be remarkable. It is one of those exemplifications of a theory which are occasionally produced. The designer wishes, we presume, to emphasise the applicability of straight lines. The roof is not visible and squareness is dominant. But a contrast is offered by the arched entrance and some curved lines in large tiled panels. It is well adapted for occupants who despise conventionalities. "The Woolwich Town Hall" is a capital building, and looks well whether seen in perspective views, photographs or geometrical drawings. But the new exterior view loses much of its effect by the ambition of the colourist, who sought chromatic effects of an unusual kind. Mr. F. T. VERITY'S "Mansion Flats, 25 and 26 Berkeley Square," are admirably suited for residences of the kind in an expensive district. Although there is uniformity in the treatment of the storeys, there is no monotony or suggestiveness that one floor is of a better class than another. The large group of "Buildings in connection with the Westminster Improvement Scheme," by Mr. W. D. CARÖE, is not reminiscent of old Westminster.

Digitized by Google

But the group appears to be well adapted for its purpose and there is no lack of variety.

The most important model is one of "The New Structure in Williamson Park, Lancaster," by Mr. JOHN BELCHER. The approach is by many steps, and at first sight suggests a French design for a great cascade fountain. At the summit is a domed building, which from its position will become a pleasing landmark. A second model by Mr. BELCHER is the upper part or crowning feature of Winchester House. As it is accompanied by a little drapery, it will to some visitors be suggestive of an element of decoration which has no fellow at the other angles of the room. Mr. ALLEYNE CRESWICK contributes a model of a proposed house at Buenos Ayres. This is one of the ultra-symmetrical class, and appears to be large enough to serve as a public building. The model of the monument to the late Marquis of DUFFERIN AND AVA in Belfast represents an architectural shrine by Mr. A. BRUMWELL THOMAS, with a statue of the statesman and figures of an Oriental and a Canadian by Mr. F. W. POMEROY. The style is Italian, and the dome is surmounted by a figure of FAME. It will be a great improvement on the ordinary public memorial.

MODERN TUNNELLING.*

THE volume by Mr. STAUFFER on tunnelling is one of those which suggest that the Americans are fast becoming the best of all writers on construction. In this country we are supposed to believe in the diffusion of useful knowledge. But the men who prepare plans for architectural or engineering works are not disposed to part with the information which they may have acquired with difficulty. In the United States, on the contrary, mysteries are only allowed to exist for a short time. As soon as arrangements are made for starting the work the drawings and specifications can be referred to by those who are eager to treat of the latest arrangements which the contractor has to realise.

The construction of tunnels is one of those subjects which must appeal to all admirers of American enterprise. We seem in England to have hardly escaped from the wonder which arose when the Primrose Hill Tunnel and the Thames Tunnel were formed. Engravings were at once brought out of both as examples of the sights of London. But, although tunnelling advanced in connection with railways, both BRINDLEY and TELFORD were obliged to employ tunnels earlier on canals. The work generally presented many difficulties, not the least being the laying out of the leading lines. The cutting was accomplished without any more force than the muscles of navvies, which apparently was the force employed on the Greek and Roman examples. The difference between early and later practice mainly consists in the number of aids the engineer and contractor can call in, and through which many of the obstacles which at one time had to be surmounted with difficulty and at a heavy expense are now subjected with comparative ease. Mr. STAUFFER begins by suggestions respecting tunnel location. In England there is only a month allowed for preparing Parliamentary plans of a new railway, and no time can be devoted to a geological examination of any hill that has to be pierced. Let powers be once given for the construction, and the money forthcoming, plenty of contractors will be ready to grapple with the difficulties. In laying out the centre line, instruments can be used which were not available in the days of BRUNEL and STEPHENSON. Mr. DUNHAM, who is an authority on tunnelwork, "removes his line from the centre of the tunnel approach, where it is always in trouble, to one side of this approach." He has adopted other methods by which the necessary instrumental work can be done in a fourth of the time required for the older methods. Time is money with the Americans, and they wish to have laying-out performed accurately and expeditiously.

The modern contractor, unlike his early predecessors, is not confined to the use of gunpowder for blasting. It is still used, and some contractors prefer it to all other compounds. But there are also varieties of nitro-glycerine, nitro-gelatine, dynamite, lithofracteur, forcite, joveite, &c. Electric firing was, we believe, first employed by CUBITT on the South-Eastern line, when in one operation 7,000*l.* was saved. It is now available for small works, and it has the advantage of diminishing accidents among the workmen. Anyone who has witnessed a serious explosion through gunpowder must feel grateful to the inventors of the new mixtures.

On the South-Eastern works near Dover CUBITT also found it economical to open lateral shafts to his tunnel. But as a rule it is necessary to sink them vertically. For this preliminary work there are several systems which have superseded in most places excavations. The following is one of them:—"The freezing process is employed under circumstances which warrant the necessary expenditure in sinking a shaft through water-bearing material. In this process the ground and the contained water is frozen to a solid mass for some distance outside the limits of the shaft by first sinking vertically a circle of special double pipes, penetrating to the full depth of the proposed shaft, and then circulating through these pipes brine or other freezing compounds. When the ground is sufficiently solid the shaft is excavated and lined in the usual manner."

The Americans sometimes use steel to construct the shaft-house. In one example 265 tons of structural steel were employed. Timber, however, continues to be in favour. The Americans still adopt the English system by which a heading is first driven. The Belgians prefer to construct the arch at first, while the Germans construct sides and top, leaving a central core or mass to support the timbering. Many arrangements are adopted in America, according to the nature of the material which has to be passed through. Although England began the construction of subaqueous tunnels with BRUNEL'S great work, and the London County Council have imitated the example, the Americans can also point to several fine instances. The St. Clair Tunnel between Lakes Huron and Erie is at a depth of about 60 feet below the water bed. The East Boston subway has a length of 2,250 feet under an arm of the harbour. The Harlem River Tunnel is a remarkable work, and was economically carried out by a sub-contractor. The Hudson River Tunnel, which is now in progress, will present the novelty of having the two circular tubes each supported by a row of 27-inch screw piles spaced 15 feet apart. This is owing to the formation of the river bed, which is a fine silt.

American subways were first constructed in 1895, when 5,600 feet of double-track subways and 3,500 feet of four-track subways were planned for Boston. The construction consisted of a concrete invert, side walls of steel columns with concrete filled between, and a roof of plate girders or I-beams with brick jack arches between them, the whole covered by concrete. In the four-track lines a middle column supported the roof. Tie rods were also used to prevent deformation of the arching. The East Boston Tunnel is mainly of concrete. New York can likewise show remarkable subways.

The chapter on plant would amaze any of the old English tunnel builders. Electric motors in some cases are used for hauling the superfluous material, and electric lamps for illumination. Another ingenious appliance is a cement-mortar car for lining tunnels, on which the mortar is made, and it can also be used as a platform for working. On one of the New York lines the steam-shovel was operated by compressed air. The system of delivering and measuring bricks which was

* *Modern Tunnel Practice.* Illustrated by examples taken from actual recent work in the United States and in foreign countries. By David McNeely Stauffer, Member of the American Society of Civil Engineers, &c. (London: Archibald Constable & Co., Ltd.)

Digitized by Google

adopted in the drainage works at New Orleans is worth mentioning. "The bricks were made near Lake Ponchartrain, and as these bricks were taken from the kilns they were piled on special crates holding 1,000 bricks each. These crates, with the bricks, were picked up by a derrick and loaded upon barges, each barge carrying 100,000 bricks. This barge was towed to a city landing, and the crates and bricks were again picked up and deposited directly on the material cars, each car carrying 4,000 bricks. The bricks were finally dumped on the work within reach of the bricklayers. This saved much time and expense in avoiding rehandling, and materially reduced the percentage of breakage." We need not consider the chapter relating to cost, because the data are derived from American examples. Mr. STAUFFER has obtained exact accounts of costs, and these he has arranged in such a way as to provide a series of units for the benefit of engineers and contractors.

When the Primrose Hill and Kilsby Tunnels on the London and North-Western Railway were constructed there was alarm about the danger to travellers in passing through such caverns. The company employed some physicians and chemists to examine the condition of the air, and they came to the conclusion that the risks in passing through well constructed tunnels are no greater than those arising in travelling on an open railway or a turnpike road. The only provision for ventilation in those days was an occasional air-shaft, which was as much used for giving light and for refuges as for withdrawing foul air. Modern tunnels have more elaborate appliances. They not only have outlets but powerful fans. Each fan in a subway of Pennsylvania has a capacity of 150,000 cubic feet per minute. Air-locks or caissons are another feature in modern construction. In the description which was printed last week of the Thames Tunnel now being constructed between Stepney and Rotherhithe, it was said that if one of the workmen passed suddenly out of the compressed air into the ordinary atmosphere he was likely to be killed. The pressure by the air-locks, however, was gradually reduced, and it would take three minutes to pass through them. In describing one employed on the Hudson River works Mr. STAUFFER says:—"Each chamber contains two narrow beds, and beneath the floor are located steam-radiating pipes for heating the chambers. Incandescent lamps are also provided, and glass windows permit the attendant to watch the patient from the outside. Fresh air is provided by a special valve arrangement, and all valves are controlled from the outside, so that an impatient workman cannot interfere with them in his desire to get out at a quicker rate than is safe. In releasing the patient from the lock two or more hours are consumed in letting off the pressure."

In his "Tunnel Notes" Mr. STAUFFER introduces several facts which may be considered as supplementary to his other chapters. One series relates to the efforts made to render concrete watertight. The author says:—

Silicate of soda and soap and alum have been mixed with cement in an attempt to make the mortar watertight. Prof. W. K. Hatt conducted experiments with these mixtures. He found that the effect of the silicate of soda diminished the strength of the mortar more than 50 per cent., and diminished the absorption of ash mortars about 50 per cent. The soap solution alone does not increase the strength, but does decrease the permeability about 50 per cent. The effect of alum and soap was to strengthen the mortar and harden it, with 50 per cent. decrease in absorption. Prof. Hatt used a 5 per cent. solution of ground alum and water and a 7 per cent. solution of soap and water. The alum water was mixed with the mortar in the proportion of one-half the ordinary gauging water; the soap solution was then applied to bring the mortar to the desired plasticity. The soap and alum acting together cause the precipitation of an insoluble compound in the pores of the mortar.

The concluding chapter deals with the Simplon Tunnel, which may be at present considered from its magnitude the climax of tunnel construction. Hereafter it may be surpassed by a still greater work in the United States. There are no disquisitions or speculations in Mr. STAUFFER'S work. Throughout he deals with actualities, and his book can therefore be taken as representing the latest efforts of an ingenious people to promote communication beneath the surface of the earth.

SAN FRANCISCO.

THE effect of the news of the earthquake in San Francisco on architects can be inferred from the following article which appeared a couple of days afterwards in the *American Architect*:—

Carthago fuit! The old school phrase must have occurred to many a man on Wednesday, as he watched with growing apprehension the startling and hardly credible news from San Francisco as it was posted on the bulletin boards. The disasters attending the outbreak of Vesuvius a fortnight ago have been far outdone by those which attended and followed the earthquake—the severest that has occurred on the Pacific Coast—that rocked and rended the city shortly after five in the morning of April 18. In the case of seaboard cities affected by earth shocks of magnitude, damage is to be expected not only from the shock itself but from the reflex or "tidal" wave, as it is usually called, which often adds the prolonged agony of drowning to the speedier pang of a crushing blow. But though both kinds of disaster are common, if occasional, it adds a new horror to such catastrophes to be reminded how the public utilities man has provided for his own use and comfort may by nature be turned against him. The ruptured gaspipes added fuel to the fires that were everywhere lighted amongst the ruined buildings and, as the same stresses had burst the water-mains, there was no water the firemen could use, even when they were not prevented from getting their engines out of engine-houses either crushed or with exits choked with débris.

While every citizen is concerned by the catastrophe, architects and builders are particularly interested, a few because they entertain the ghoulish hope that, because of it, they may secure fresh "jobs," but the many because they expect to learn facts of the utmost value to them. Ever since the introduction of the steel frame architects have been looking forward with expectant eagerness to the time when the stability of the new style of building should undergo a real earthquake test. Of course, the finite cannot compete with the infinite, and no architect imagines he can build anything but a pyramid or a concrete sphere that would sustain the severest shock that nature, presumably, could inflict; but if he can by the use of the steel frame build structures that will endure the strains that would shake to pieces buildings constructed of other materials and on other lines, he desires to be assured of it at the earliest possible moment. The long-desired test has now been had in extreme form and the entire building world is ready to digest the expert testimony that may, in a few days, be expected to disclose just how the earthquake affected the few "high buildings" in the city, particularly the Claus Spreckels Building, which was designed, eight years ago, by the Reid Bros., and which for its day was an exceptionally good piece of construction. It is unfortunate that the effects of the earthquake proper have been obscured or destroyed by those of the ensuing conflagration and the exploding charges of dynamite used in blowing up buildings in the path of the fire. The early testimony is that the steel-frame buildings sustained the shock with fair success.

But the shield has two sides, and though the brighter one is not so cheerful as the sinister one is dark, it is probable that San Francisco, like Chicago, Boston, Baltimore and other fire-swept cities, will in later years realise that its costly purification was advantageous. A wholesale destruction of a community's property by fire may, by fair analogy, be considered identical with the discarding of out-of-date, though still serviceable, machinery that so often in these days is practised by progressive and long-sighted manufacturers. San Francisco is, fortunately, in better position to reap advantage from its misfortunes than were the earlier afflicted cities, since Mr. D. H. Burnham has for months been studying the situation and preparing a report—possibly already filed—of a scheme for improving the city through the formation of new streets, parks, parkways and

Digitized by Google

so on, and the present disaster may possibly make the adoption of his suggestions all the more practicable, while the fact that he and his assistants have so thoroughly considered the topographical, social and commercial conditions of the whole city will make it all the simpler for them to cope with the new problem of laying out afresh the burned-over district.

But while San Francisco is the chief sufferer, it is not by any means the only one, and amongst other towns that suffered was Palo Alto, where, as the early reports have it, the interesting buildings of the Leland Stanford, jun., University were practically destroyed. If the report is true and these low masonry buildings, new, exceptionally well-built and expressly intended to be earthquake-proof, have seriously suffered, while steel-frame structures have escaped essential damage, the contrast will provide instruction in a form most easily digestible by layman and expert.

Whatever else may prove to be the case, this San Francisco disaster may be different from all others in the manner in which the final losses are adjusted. In the cases of the earlier "great fires" the loss was really distributed and assessed upon the country at large, through the collection of insurance from the guaranteeing companies—except where they went to the wall under strains greater than they could bear. But in the case of San Francisco—unless policies in that earthquake-affected district give specific protection from loss through shock and resulting fire—it is probable that the insurance companies will contest every claim, and the burden of proof that the insured building was unaffected by the earthquake at the time fire seized upon it must rest upon the owner, and, as such proof must be very difficult to procure, the chances are that such owners will have to shoulder their own total losses.

A similar view was taken by the *Engineering Record*:—The San Francisco catastrophe has not been reported in any detail up to the time this part of the paper goes to press, and accordingly it is only possible to point out that steel-cage construction has again vindicated its claims for structural superiority. While buildings of the ordinary commercial and warehouse type were shaken down like houses of cards by Wednesday's earthquakes, the more imposing buildings of the steel-cage type resisted the swaying of the earth and were injured by fire alone, except in some of their more fragile portions. The tremendous shaking the unfortunate city received not only opened the gas mains and wrenched boiler plants and smaller furnaces so that fire sprang up in many places, but it also wrecked the system of water mains in those districts where water was most needed to check conflagrations. The fires were fought by dynamiting small buildings, but this is a feeble method and the results were naturally poor. The important lesson of the disaster is the necessity of better construction of buildings in a city so subject to earth tremors as San Francisco. Small vibrations occur there frequently, and indicate the probability of occasional greater disturbances. The Japanese have recognised this fact, and have been constructing their more important buildings with steel-cage frames. The palace of the Crown Prince, which was described in this journal a few years ago, is an excellent example of a comparatively low building designed with special reference to high resistance to earthquakes. It is out of the question, of course, for residences and small commercial structures to be built with steel frames, but it is equally incorrect to rely on ordinary methods of framing in a locality where the joists of a floor are likely to be shaken out of the wall recesses where they rest. At this writing the greatest loss of life seems to have occurred through the collapse of floors in this manner. Until more complete information is available, however, it is futile to attempt any elaborate discussion of the technical details of this great calamity.

SWEDISH ARCHITECTURE.

THE history of Swedish architecture begins with the establishment of Christianity in the country during the eleventh century. The primitive architecture, of whose productions we find examples in the small country churches of Westgotland, experienced its first tendency to elevation at the erection of monasteries in various parts of the country by the Cistercian order. The church of Varnhem in Westgotland—preserved from one of its foundations—is the chief memorial of Romanesque art in Sweden, and is secondary only to the splendid cathedral of Lund, a construction from the twelfth century, comparable to the Rhenish cathedrals.

Most plentifully, however, the creations of Swedish Mediæval art are to be found in Gotland. A whole cast monument of this art is the city of Wisby with its mighty town hall still in good repair, its streets, its houses and its many churches, which latter, with one exception, certainly are fallen into ruins, but yet can be seen in a state of preservation complete enough to make clear what once they were. These churches belonging to the eleventh and following centuries, the fourteenth inclusive, and representing all the phases of Mediæval architecture except the late Gothic style, are each of interest by their original composition. The oldest is the Helgeand Church, a peculiar central construction; the most beautiful is considered to be St. Catherine, built in the early Gothic style. In its rural districts Gotland possesses quite a treasure of churches, in perfectly good repair, from the same ages. Unpretentious in size, they excite surprise by their original designs, their well-calculated proportions, and their rich and characteristic details. The typical ones are independent variations of the Romanesque basilica and of the Gothic hall-church with columns. The most beautiful churches date from the thirteenth century, and represent a transitional style uniting the imaginativeness and elasticity of the Gothic with the calm plasticity of the Romanesque style, a style of architecture so original and so artistically put into effect that it is entitled to a name of its own—the Gothland style.

Among the works of Gothic architecture on the mainland ought to be mentioned the splendid cathedral of Linkoping, begun during the Romanesque time, but completed as a Gothic hall-church, in the details of which Gotland prototypes have been traced; further, the Skara Cathedral and the church of St. Bridget's Nunnery at Wadstena—these, like all the other edifices mentioned above, built of cut stone. A Romanesque brick church will certainly be found here and there in Skane, but it was only with the Gothic style that—by North German influence—a real brick architecture arose, which in Southern Sweden has left the richest specimens of its production, and in the central part of the country displays more unpretentious but more independent forms. A combination of stone and brick architecture exhibits itself in the foremost Mediæval building of Sweden, the Upsala Cathedral, a nobly proportioned structure, whose prototype is taken from Northern France, with most of its details carried out in stone, but the masonry framework in brick. Many Swedish Mediæval churches, among which specially some small country churches in Roslagen, are adorned with beautiful and characteristic painted vaults. Of secular Mediæval architecture Sweden has comparatively few remains; amongst such may be mentioned the so-called old Pharmacy in Wisby, and the castles of Wik in Uppland and of Glimmingehus in Skane. Wood architecture, which preceded stone architecture, subsisted at the side of it, and no doubt has exercised an essential influence on the latter, was probably highly developed during the whole of the Middle Ages, and was related to Norwegian art of that kind, but only very few remains have come down to our time; one, however, is the so-called Ornasstugan in Dalarne.

The Renaissance, like the preceding new epochs of art, arrived late in Sweden. It does not make its appearance till in the second and third decades of the sixteenth century, and is contemporary with the Reformation and the political emancipation of Gustavus Vasa. If the Renaissance and Protestantism, in general, mark a transmission of the architectural centre of gravity from the religious sphere to the profane one, this will be especially the case in Sweden, where ecclesiastical property about that time was in great part transferred to the Crown, so that many a monastic building had to provide the stone material of the castles erected by Gustavus Vasa and by his sons. These castles, being partly continuations of Mediæval structures, partly completed new buildings, are the characteristic edifices of Swedish Renaissance. To the former category belongs the chief of them, the castle of Kalmar, an extensive and picturesque building, among the details of which especially, the well is an interesting work of art; also Gripsholm, at Lake Malaren, a Mediæval castle reconstructed during the Renaissance, and enlarged also during the following centuries; it forms a complex group of buildings with an exterior quite simply made of brick, but containing rich and picturesque interiors. Foremost among the new-built castles stands the beautiful Vadstena at Lake Vettern. Unfortunately the old royal palace of Stockholm—also of Mediæval origin, and perhaps the grandest work of Swedish Renaissance—was destroyed by fire in 1697.

Digitized by Google

The first artists of the Renaissance in Sweden were chiefly Germans and Dutchmen, after them a Swedish school by-and-by developed itself. Distinctive features of the style are :—Exteriorly, a simple effect produced by the bulk and enlivened by solitary details, amongst which specially the portals are of a superior character; and interiorly, a decorative system, at times magnificent, at times of unaffected loveliness and often produced with the simplest means. The few churches erected during that period (the end of the sixteenth century) are imitations of the Gothic style.

The wood architecture inherited from the Middle Ages was further developed by the Renaissance as well as by later epochs. Its best productions are the belfries often to be seen at country churches, and revealing a constructive power brought to a high degree of perfection at the side of an artless but sensitive formative ability. The same conditions are noticeable in sundry churches, *e.g.* that of Habo in Westgotland ; further in many peasant houses, especially in Dalarne, in the harbren or larders peculiar to that province, in the so-called Bjorkvik Fatbur (larder), &c.

The Baroque style has three phases of development in Sweden. The first covers the beginning of the seventeenth century, and forms a somewhat modified continuation of the Renaissance. To this era—to that of the early Baroque—belong several handsome country seats, as, for instance, Tido in Uppland and Lecko at Lake Wenern, as well as a number of palaces and houses in the towns which at that time displayed a lively structural activity. Characteristic of the period is also an increased interest in ecclesiastical art, certainly resulting in sundry reconstructions and new buildings, amongst which ought to be mentioned the little, abundantly decorated German church of Stockholm and the magnificent church of Kristianstad, erected by Christian IV. at a time when that town belonged to Denmark, but especially in decorative details, portals, sepulchral monuments and movables with which old churches are fitted up. A German trait of character has often put its stamp on the architecture of that age, especially on the burghers' houses, which mostly are architectonically decorated.

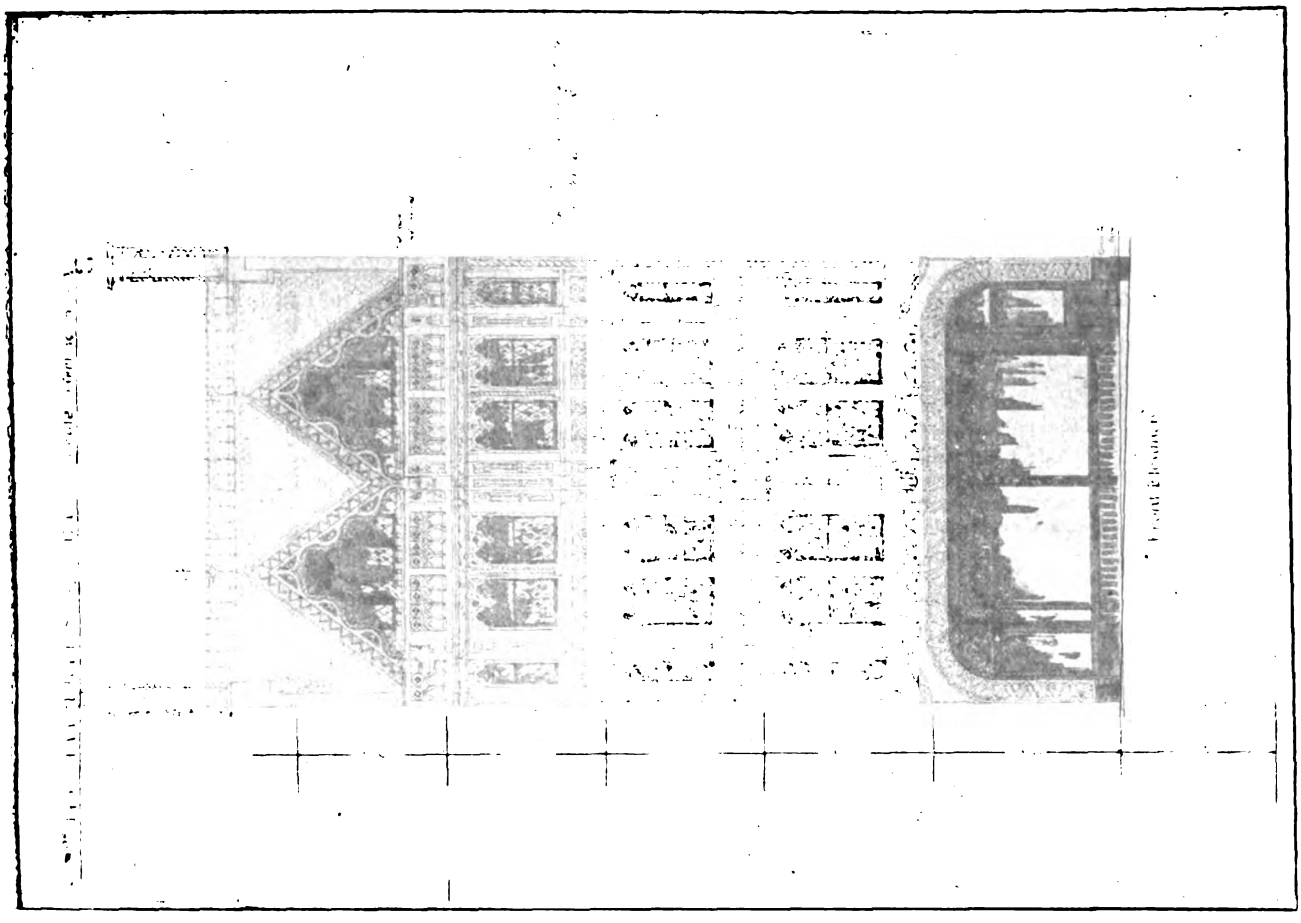
The next era—that of the later Baroque—coincides with the era of Sweden's political greatness during the latter half of the seventeenth century. Castles and palaces, in which particularly the capital and the Malar provinces now begin to abound, are erected on a scale hitherto unknown, and the previous more serious character of style passes over into a lighter one, with impulses chiefly from France but also from Italy. A grand imposing design and excellent proportions are traits distinctive of the edifices, the details of which, however, sometimes are studied somewhat negligently. The foremost architects of the time are Jean de la Vallee (1620-96) and Nikodemus Tessin, sen. (1651-81). The former has, amongst other things, completed the House of Nobles, the most representative building of the time, and erected the present town hall and other palaces of the capital. The latter in his works, amongst which should be mentioned the palaces of Axel Oxenstierna, that of the Bank of Sweden besides other edifices in Stockholm, the main part of the royal palace at Drottningholm, the palace of Borgholm in Oland, the cathedral of Kalmar, proves a versatile, talented artist, understanding how to express architecture—now a magnificent or seriously monumental character, now an idyllic, lovely one. Nikodemus Tessin, jun., was a co-operator in many of his father's later works, and in this way rise was given to the last era of the Swedish Baroque. It is contemporary with the European Rococo, but shows a somewhat deviating character, and might be termed the Tessinian or the royal palace-building period.

TESSERÆ.

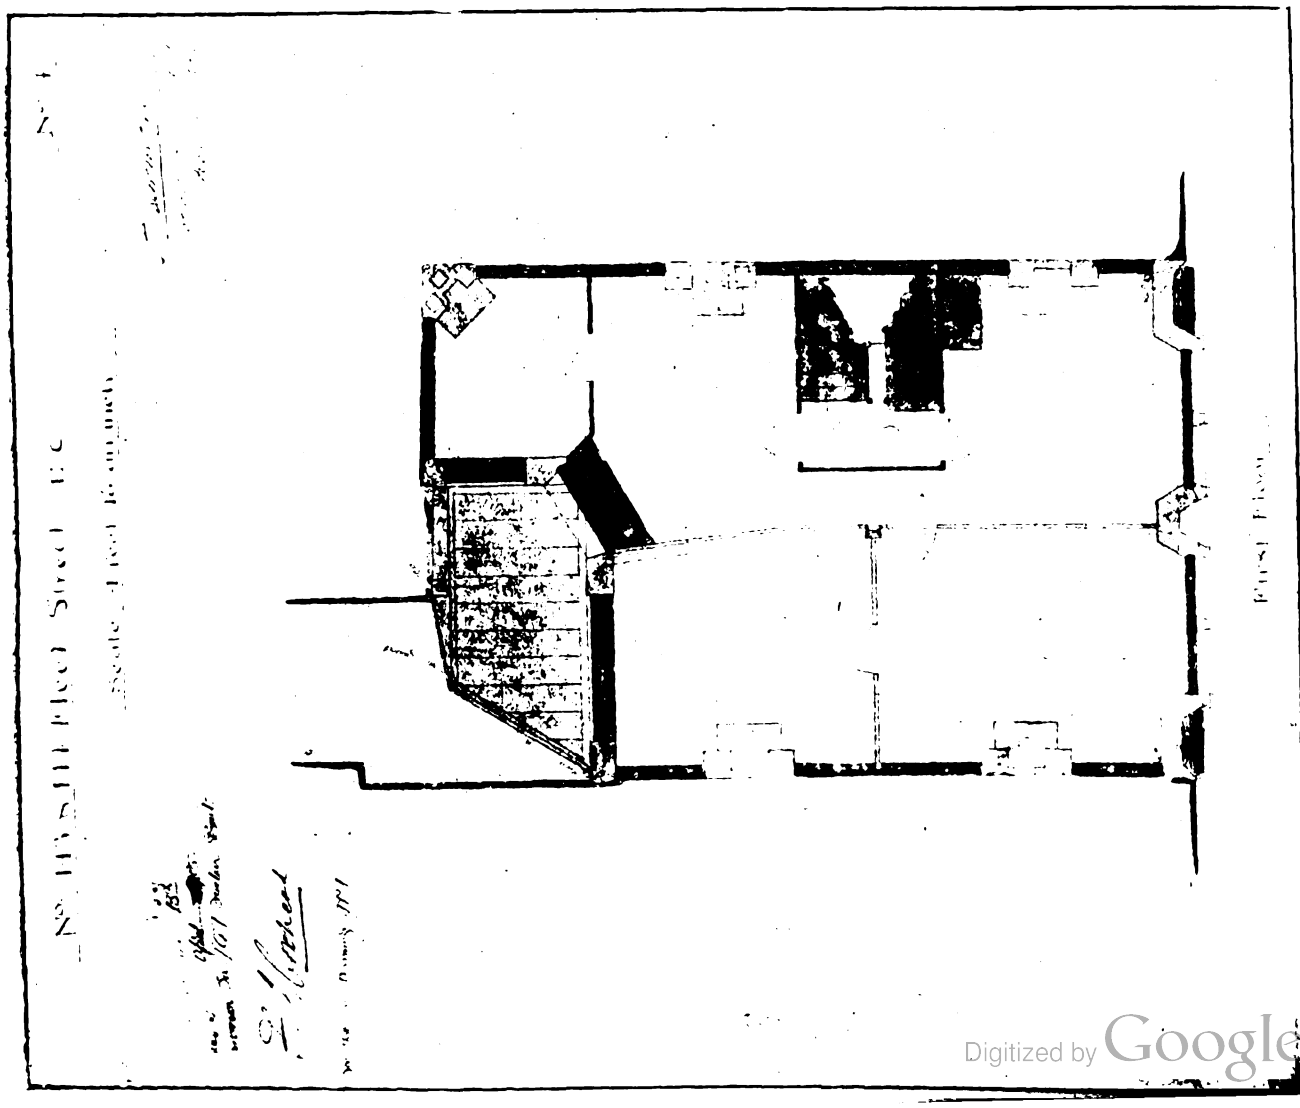
The Use of Caryatides.

INIGO JONES'S idea for a circular court with a caryatic order in his designs for Whitehall Palace certainly does not offer the happiest adaptation and combination of which they are susceptible. Human figures, the height of an entire storey of a building, are themselves rather too preposterous, at the same time that they tend, by the comparison they force, to render the other features petty and trivial. In Egyptian architecture indeed colossal statues and anthropostyle pillars of most extraordinary dimensions are not unfrequent, yet such a scale is not suited to either Grecian or modern architecture. When caryatides are employed they should always be considerably less than the columns, neither can they be substituted indiscriminately for the latter. An anthropostylar portico could hardly be made to produce a pleasing effect. The small caryatic structure forming a part of the Triple Temple at Athens, and which has been imitated in the lateral vestibules at the eastern extremity of St. Pancras Church, is rather a species of *pseudoporticus* than what is generally understood by the term portico in its usual modern acceptation, and therefore cannot be quoted as an anthropostyle example of one. Caryatides do not look well standing upon a floor, and if in order to correct this, and also to give them greater elevation without enlarging their dimensions, they are placed upon separate pedestals, the effect, so far from being improved, is rendered still more objectionable. Such figures always require to be placed upon a continuous stylobate. They are admirably adapted for interior decoration, particularly where an ornamental tribune or gallery, or some aperture of the kind, is required in the upper part of a wall. On the top of a screen wall, again, about double their own height, in vestibules, &c., they may be introduced so as to combine a high degree of scenic effect with no small share of convenience. In external composition likewise a screen of this kind behind a range of columns would be neither without beauty nor without novelty to recommend it.

E. Rooker, Architectural Engraver.



To his architectural subjects Rooker gave a richness and freedom which have never been surpassed. His "Interior of St. Paul's Cathedral, ornamented as intended by Sir Christopher Wren," and "Blackfriars Bridge when Building" are in high and deserved reputation ; to these may be added his "Oxford Almanacks," several etchings after the paintings of Wilson, and also those for a work published by Robert Adam in 1764, "The Remains of the Palace of Dioclesia at Spalato ;" this publication is enriched also by the etchings of Bartolozzi, Santini and Zucchi. But perhaps the finest examples of Rooker's style are those prints (etched in conjunction with P. Sandby) after the designs of J. Collins—subjects from Tasso's Jerusalem. These plates are in the boldest and freest style, not excepting the works of Piazzetta, whose manner, or rather force, they appear to imitate, yet possess more variety in the display of foliage, trunks of trees and other materials of landscape scenery. Edward Rooker was not only distinguished for his abilities as an engraver, but was also the best harlequin of his time. He left a son, Michael Angelo Rooker, who became a clever artist, and was elected member of the Royal Academy. He was also an excellent draughtsman, engraver and scene-painter.



Monumental Effigies.

Among the various antiquities which England possesses there are none so immediately illustrative of our history as these national monuments which abound in our cathedrals and churches. Many an exquisite specimen reposes in lonely unfrequented village churches, their beauty hidden by coats of whitewash, and their safety dependent on their utter worthlessness in the eyes of those whose duty it should be to guard them against destruction. Instances are on record where the stone effigies have been wantonly broken up to mend roads, and the brasses sold by dishonest sextons for their value as old metal. The value of these ancient records cannot be too imperatively dwelt on. They are historic data, they are mementoes of the arts of the Middle Ages, they are the form and semblance of our great forefathers fashioned by contemporary hands and bequeathed to us as the last memorial of their mortal state. All who injure them commit not only sacrilege to the church, they dishonour the dead and act contemptuously to the persons and memory, as far as in them lies, to the ancestry by whose wisdom and valour the progressive improvement of our country has been obtained and the wholesome laws and free movements we enjoy battled for and won. The language cannot be too strong that should be used to impress their value on the minds of those who have them in their keeping. May the hands they uplift in prayer speak to man as they appeal to Heaven, and hinder the wantonness of ignorant destruction, that posterity may have the privilege we have ourselves of gazing on the figures of the good and great preserved by the same pious feeling in which the old poet, Spenser, apostrophises them as "Old monuments, which of so famous sprites, the honour, yet in ashes, do maintain."

The Cowdenbeath Municipal Buildings, which have been erected from the designs of Mr. T. Hyslop Ure, architect, Dunfermline, were opened on Friday last.

NOTES AND COMMENTS.

WITH a contract amounting to 52,805*l.* 12*s.* 5*d.* the sum of 678*l.* does not appear an excessive claim for extras. Expressed briefly, that was the point at issue in an action which was tried a few days ago in Dublin and in which no less than six King's Counsel were employed. The action was tried before Mr. Justice WRIGHT with Mr. ALBERT MURRAY, architect, as assessor. It was brought by Messrs. HILL BROS., builders, Cork, against the County Councils of Galway and Roscommon, being the joint governing body of the Ballinasloe lunatic asylum. They sought to recover the sum of 4,905*l.* 12*s.* 2*d.*, balance on foot of a contract for erecting the buildings. The defendants lodged in Court a sum of 4,110*l.*, and as regards the balance alleged that it was for extras for which no order had been given, and that the prices charged were too high. The defendants also counterclaimed for 100*l.* as regards defective material and 1,420*l.* penalties for delay in the execution of the work. They also lodged 117*l.*, being one-half the amount of the surveyor's charges. It will be seen that the difference amounted, as we have said, to 678*l.* Mr. Justice WRIGHT found for the plaintiffs. Although a stay of execution until May 15 was granted, plaintiffs were allowed to draw out 4,000*l.* from the sum deposited in Court.

THE Rue de Sèvres in Paris still continues to be a favourite site for hospitals, and at one time it appeared to be devoted to them and to convents. One of the latter was known as the Abbaye-aux-Bois. It was an old establishment, for on the site was erected in 1202 the original abbey. In 1650 the inmates fled from Paris during one of the civil wars, and the buildings were subjected to many vicissitudes. At the time of the Revolution in 1790 the convent was suppressed. When order was restored the buildings were occupied partly by nuns and partly by secular inmates. One of the inmates was Madame RÉCAMIER, and her salon was, between 1814 and 1849, the literary centre to which the principal French writers gravitated. For some years the lion was CHATEAUBRIAND, who there lay down the laws of the belles-lettres. A few days ago the whole of the convent buildings were sold with the grounds adjoining them, and before long buildings in many storeys will be erected there. The society that takes an interest in old Paris is having drawings and photographs made of all the parts which exist, and especially the rooms occupied by Madame RÉCAMIER. They will be added to the other records belonging to the city of Paris.

THE Commissioners of Works have issued observations on some of the Bills now before Parliament seeking powers for the generation and supply of electrical energy. They are apprehensive that the products of combustion may be injurious to the parks. They are also not free from doubt whether the national treasures in museums and picture galleries are not also exposed to danger from the same cause. There is not merely black smoke or sooty or tarry matters to be considered, but other products of combustion which are deleterious not only to vegetation, but to pictures, marbles, metals and other objects in museums. One of the generating stations is close to the building which contains the WALLACE collection. It is stated that smoke with its sooty and tarry particles can be so well consumed by proper apparatus that no danger ought to arise in that respect. Effectual means should be taken to secure that apparatus of the most approved character shall be employed for the consumption of smoke. The use of dust-destructor refuse as fuel should be altogether prohibited. But the principal enemy to be combated is sulphuric acid, the production of which can be much diminished, if not entirely prevented, by pouring lime-water on the coal before it goes into the furnaces; and the Commissioners think that this condition, the fulfilment of which would involve small expense and not much labour, might reasonably be insisted upon.

ONE of the largest and most interesting of the South Kensington Handbooks is the second volume of Dr. S. W. BUSHELL's "Chinese Art." It relates to pottery and porcelain, glass, enamels, jewellery, textiles and pictorial art. There are over one hundred page illustrations from objects in the Victoria and Albert Museum, besides several on a smaller scale. Although taste differs from time to time, and there may not be such a wide admiration for Chinese work as in other periods, it still has steadfast appreciators, who value the products by the theories of art which guided the native craftsmen. The first plate represents a square brick dating from B.C. 206 to A.D. 8. The mythological figures resemble the beings which used to be shown as living in London water, and suggest the power which terror exercised over artists and patrons. One delightful division relates to pictorial art which was practised prior to the beginning of our era. The earliest example shown in the pages dates, however, from the fourth century A.D., and is in the British Museum. The most attractive, perhaps, are the landscapes, some of which recall the perspective adopted in the composition of the ever-popular "willow pattern" plate. The Board of Education are rendering a service to amateurs in producing so valuable a treatise at an almost nominal price.

ILLUSTRATIONS.

MASONIC INSTITUTION FOR BOYS, BUSHEY, HERTS: ASSEMBLY HALL.

MANSIONS AND FLATS, CLEVELAND ROW, CLEVELAND SQUARE, ST. JAMES'S, S.W.

THE accompanying illustration shows a perspective view of the above buildings which are in course of erection on a site facing St. James's Palace and Bridgewater House. The block has been designed for three town houses which front Cleveland Row, and suites of residential chambers having an aspect to Cleveland Square and the Green Park. The London Fencing Club, whose premises formerly occupied this corner of the site, have new accommodation on the fourth and fifth floors. The elevations have been governed by the main horizontal lines of the neighbouring property. The windows are grouped symmetrically and enriched with iron balconettes. The whole building is surmounted by a modillion and dentil cornice, the former being coupled to bring the whole in scale with the cornices of the adjoining buildings. The general contractor for the work is Mr. J. CARMICHAEL, and it is being executed from the designs and under the superintendence of Mr. FRANK T. VERITY, F.R.I.B.A., 7 Sackville Street, London, W.

[DESIGN FOR BANKING PREMISES AND CHAMBERS, CORNER OF PICCADILLY AND ST. JAMES'S STREET.

IN consequence of the widening of Piccadilly the old premises have been pulled down, and we illustrate a proposed treatment of this valuable corner block, which, even after its curtailment by some 1,200 square feet, costing the authorities about 42,000*l.* to acquire, occupies an area of between 5,000 and 6,000 square feet, and is estimated to be worth a ground rent of 6,000*l.* per annum. The building we illustrate shows the site developed for banking, insurance and business premises on the lower floors, with suites of flats above, and the designs were prepared on behalf of the Norwich Union Life Insurance Society, who are the freeholders, by Messrs. ERNEST RÜNTZ & FORD, of 10 Walbrook, E.C.

NEW BUILDING OF THE EDINBURGH LIFE ASSURANCE COMPANY, 122-128 ST. VINCENT STREET, GLASGOW.—PUBLIC OFFICE—ENTRANCE HALL.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting for the present session of this Association was held on Friday evening last at Tufton Street, Westminster, Mr. E. Guy Dawber, president, in the chair.

Messrs. H. S. Watling, E. J. Tanner and A. R. Ashby were elected members.

House List, 1906-7.

The scrutineers in their report of the election of officers stated that 409 voting papers were received, a decrease of seventy on the figures of last year. The result was as follows:—President: Mr. R. S. Balfour; Vice-presidents: Messrs. Walter Cave and A. Needham Wilson; Council: Messrs. E. Guy Dawber, Arnold Mitchell, Louis Ambler, J. B. Fulton, A. Maryon Watson, J. Murray, W. Curtis Green, A. Keen and E. W. M. Wonnacott; Hon. Treasurer: Mr. H. T. Hare; Hon. Secretaries: Messrs. H. Tanner, jun., and C. Wontner Smith.

Editor of A.A. Journal: Mr. Maurice E. Webb.

Hon. Librarian: Mr. E. Gunn.

Hon. Assistant Librarians: Messrs. H. J. Worrow and Percy May.

The President said at the end of the session there must always be some gaps in their ranks, but there was one resigning office whom they would miss very much, he referred to their hon. treasurer. Mr. Francis Hooper had undertaken those duties for the last five years, and the amount of time and care and personal zeal he had devoted to the welfare of the Association could not be overestimated. They would remember, too, that Mr. Hooper had been treasurer during the arduous time commencing with the transfer to new premises and the collecting of money fo the building fund. The President moved a hearty vote of thanks to the retiring treasurer, which was passed with loud acclamation.

A vote of thanks was also accorded the School of Design visitors for the valuable assistance they had given to students in their work.

Mr. WALTER CAVE read the following paper, illustrated by lantern views, entitled—

Fenestration.

Fenestration—or the disposition of window-openings in relation to the structure—is a subject which is inseparably connected with the whole history of architecture, and the manner in which light was introduced into buildings has always been one of the most important elements in determining their style.

The influence of climate, the necessity for protection, the manufacture of glass and the relative positions of buildings have all affected the size and shape of windows; and in the following paper it is proposed to deal with the subject in some sort of chronological order, which will enable the development of fenestration to be more easily followed, and to show how these various influences in different countries have left their mark on the architecture of the time.

In all the great buildings of past ages, which consist of halls arranged side by side, the method of admitting light was constructionally the same. We find in the vast temples of Egypt the same arrangement of clerestory which the Gothic builders brought to such a pitch of perfection. The central hall or nave was taken up higher than the side halls or aisles, and this plan in itself was a determining factor in the design. In the great temple at Karnac, which may be taken as typical of the early hypostyle buildings in Egypt, we find a clerestory which was never glazed; and in the temple at Kalabsche, built during the Roman occupation, we find the same system employed to light four successive chambers, one behind the other, each, of course, having the ceiling at a lower level. The introduction of light generally throughout a building was not considered a necessity—partly due perhaps to the mysterious rites of the Egyptian religion, and partly perhaps due to the wonderfully brilliant skies of the East, which not only gave the smallest openings their utmost value, but made a cool and dim interior of infinite value in the desert. In later times there is evidence that the domestic buildings had openings in the front walls over low screens, and in the Temples of Edfu and Dendera the same arrangement can still be seen. But this method of admission of light must not be treated at length in a paper dealing with fenestration, except as an instance of the simplest method, for in reality these openings were only the omission of the wall-screens, either between the columns and the lintels of the clerestory or between the columns in the façade, and to pursue this part of the subject would partake too much of an archæological discussion.

When we consider Grecian architecture and the method in which the interiors of those wonderful temples were lit, we are faced with a greater difficulty and more uncertainty. In the Erechtheum and the great temple at Agrigentum, in Sicily (420 and 480 B.C.), we have, according to the accepted restorations, windows in the side walls, but these are both exceptional instances, and even here the problem of how the central part was lit remains a matter of conjecture. In the Erechtheum the three windows which appear to have existed are so placed that they seem to have been almost an afterthought. The windows themselves are square-headed, rectangular openings, about two squares in height, tapering towards the top and placed somewhat uncomfortably as regards their heads, which come at some distance below the caps of the columns; they were probably fitted with pierced marble screens. In the temple at Agrigentum the windows appear to have been somewhat narrower in proportion, and the heads so arranged that they more nearly line with the caps, and seem to become a part of the original design, but have a very crowded effect. Both these examples, as has been stated above, are exceptional and may be taken as proving the rule that the Greeks did not consider that openings in the screen-walls were the best form of lighting their temples.

All Greek architecture came, we know, from the South, the land of brilliant sunshine, where windows, as we understand them, were either unknown or of quite subsidiary importance. They were very few in number in all Classical work, and never placed to form more than one tier. We can thus, I think, draw the conclusion that windows such as we require are never really successful in columnar architecture. The Greeks felt this and never developed the scheme, and the modern attempts to combine fenestrated with columnar architecture show the impossibility of making a happy compromise between two totally conflicting styles. Take the instance of the Royal Institution in Albemarle Street, where we find a single Corinthian order the full height of the façade, in itself well proportioned, but its general effect marred by the introduction of windows, which look rather mean and squeezed in between the columns, and spoiling the effect of the connecting screen-walls. If the columns are detached and in their proper proportion, either the windows are darkened and become too small or the general effect of the façade is weakened by bad intercolumniation if the windows are designed to give their full lighting value to the interior.

That the Greeks had a method for lighting their temples is generally accepted by all archæologists, and it seems evident that if it was not from the side walls it was from some form of roof or clerestory window. There is, however, one other theory which has a literary foundation. In the tragedy of Iphigenia in Tauris, it is actually stated that the intervals between the triglyphs in a certain temple were left open and were to be utilised as a means for thieves to enter. This is a possible solution, but the evidence of words is apt to be misleading in such a case, and it is more probable that some form of clerestory adapted to a sloping roof, as suggested by Mr. Fergusson in his "History of Architecture," was the real method of lighting these interiors, and in support of this we have the evidence of the Egyptian temples. St. Peter's, Eaton Square, is an attempt, and a successful one, to light a church in this method. But, again, the subject becomes of more archæological than architectural interest, and it is not till we come to the great buildings of the time of the Roman Empire that the admission of light came to be considered as the integral part of the design.

It is thus apparent, and the following remarks will make it more evident, that fenestration became more important as the art of building advanced westward and northward until it reached its most interesting development in our own country, where the necessity for light is of such great importance. The great eye of the Pantheon is a good starting-point for a more detailed consideration of the subject. In this very remarkable building we have an interior completely and perfectly lit by one central opening in the dome 27 feet in diameter. The total cubical contents of the Pantheon represent nearly 2,000,000 cubic feet (1,934,600), which gives the extraordinary result that each square foot of skylight lights 3,380 cubic feet of space. This instance has been quoted to show the enormous value of a vertical light, which, according to generally accepted rules, can be taken as about thirty times as valuable as an horizontal one. The arch and dome construction of the Romans gave an opportunity for windows, which were introduced high up

Digitized by Google

beneath the vaulting and above the four barrel arches supporting the dome; these were usually great semicircular openings, and divided by massive mullions into three divisions, finished, according to Viollet-le-Duc, one with frames of bronze enclosing panes of glass, alabaster, or simply latticework. This, it seems probable to suppose, was the usual way of lighting the great central courts of the Roman buildings, and from their plans we know that the various rooms ranged round this court must have been lit only by borrowed lights from the central court itself.

We now come to a very important consideration in fenestration, and that is glass. During the Early Eastern work, briefly referred to above, both in Egypt and Greece, there is nothing to lead us to suppose that glass was used in windows. The openings in the Greek temples were almost certainly unglazed or fitted with marble screens, and the position of these, either in the frieze or as concealed dormers, would not make it an absolute necessity. That glass was in use for domestic utensils at a very early date is undoubted, but it is not until the beginning of the Christian era that we have a definite reference to its use in windows. Pliny, who died in 113 A.D., describes, in his "Laurentine Winter Villa," a glass door and curtain, and we may assume that, at least in some cases, glass was used in screens to light the smaller rooms round the great courts of the Roman buildings. It is interesting to note that the great group of the Laocoon was found in one of these inner chambers with no external opening.

Thin slabs of alabaster were, no doubt, used in some instances, similar to those still to be seen at Orvieto Cathedral, and pierced marble screens, like those from the Taj Mahal (built by Italian workmen in 1630), India; and plates of glass, 7 inches by 9 inches, cast in marble frames, are still to be seen at Sta Sophia, at Constantinople, which probably date from the building of the church by Justinian, A.D. 540. Bede mentions that in 680 A.D. Abbot Biscopus sent to Gaul "manufacturers of glass for windows," which shows that the habit of glazing windows was by no means common in the west of Europe at that time. Even in England during the twelfth century glass was not in common use, for there are instances of church windows which were closed by shutters of wood or stone, which were unglazed.

But to return to the Roman buildings; it is of importance to note that great regard as to aspect was observed. In the Baths of Caracalla—a typical building—the lights beneath the domes opened towards the most favourable points of the compass. Vitruvius, in discussing this subject of orientation, says that "due regard should be had to climate (*i.e.* latitude), for the same arrangement will not suit in Egypt and Spain, and it must be different in Pontus and in Rome. In northern countries the buildings should be vaulted, well closed in, and their openings small, facing a warm aspect. On the other hand, in southern countries, subject to the burning heat of the sun, the openings should be large and face the north and north-east." In Cicero's letter to Atticus we have a very interesting passage, where he quotes his architect's reasons (which seem to be somewhat modern):—"Know that in blaming my windows as too narrow you are finding fault with my architect, Cyrus—happily it is only with the architect. When I was saying the very same thing to him he pointed out to me that wide windows looking into a garden did not offer a prospect so agreeable to the sight. For let A be the eye of the spectator, B and C the object he sees, D and E the rays proceeding from the eye to the object—you understand what follows." This unfinished demonstration, of which no diagram has come down to us, is not particularly convincing, but may be taken as an instance of mystifying the client, which is not entirely confined to the time of the Roman Empire. He further adds, "If you find anything to criticise in other parts, I shall always be prepared with a tolerable justification, unless I can make a change for the better at a smaller cost."

The true Roman architecture was based on the use of the Greek lintel construction combined with the Etruscan arch, and without going into the details of the origin of the latter it is sufficient for our purpose to note that this combination gave an opportunity of lighting buildings from the side walls. The intercolumniation of the Greeks, as has been pointed out, precluded a satisfactory form of fenestration, but with the pillars placed at a distance from one another equal to their own height, the intervening screen-wall was well adapted, if not obviously intended for window openings. In later times by superimposing one order above another, giving a series of storeys, the opportunity for systematic fenestration was attained, and the windows thus became an integral part of the design. This plan ultimately led to the very elaborate wall arcading which is seen in so many buildings from 500 to 1200 A.D., but its use as a means of systematic fenestration was rare, and, as a rule, was a mere necessity of construction. In many of the Early Romanesque buildings in Italy we find a curious arrangement of windows. For instance, in the great basilica of St. Apollinare in Classe, at Ravenna, begun in 538 A.D., the window openings are very small and made quite subordinate to the wall arcading on the exterior, but from the inside the spacing of the windows is most thoughtfully carried out, as in the case of the sister church of St. Apollinare Nuovo. This system of designing the window openings from the inside with little regard to exterior is typical of a people who were developing a style of architecture suited to their western requirements based on the eastern tradition, and it is highly probable that the Early Christian antagonism to all the heathen practices may have led them to ignore their exteriors, on which the Greeks spent so much thought and labour.

In the Byzantine style the same remarks, to a certain extent, hold good, but it is now proposed to leave the eastern architecture and follow the progress of fenestration westward, and see how the Gothic builders treated their windows. It would take too long to enter into a comparative detailed account of the various national styles in Europe, and we will at once proceed to the English Gothic buildings. The first thing to be noticed is the same arrangement of subordinating the windows to the external wall-decoration, as has been described at Ravenna. These windows in our Early Norman work were small, and their size was due to various causes; the desire for protection against enemies in those troubled times when churches (and especially their towers) were used as places of defence and refuge; the difficulty and expense of obtaining glass, resulting in their generally being unglazed, and only a shutter of stone or wood used to keep out the weather; and as has been before mentioned, the form of window itself came from the East, or the land of sunshine.

The treatment of the window openings in the early church towers is very effective. In most cases they were small, and arranged in groups high up, with a baluster-shaft dividing the lights; the main part of the tower was left plain, and great dignity is thus produced. With the advent of the pointed, or lancet windows of the thirteenth century, a real attempt was made to make a design in fenestration both from the inside and out. In the lofty square-ended fronts of the Cistercian buildings we find the windows ranged in deeply set arrays of varied arcading. But, as a rule, the Early Gothic windows in the arcades were subordinated to the general wall scheme, and at Crowland, Durham and Ely the Benedictine monks built tier upon tier of arcaded galleries, with occasional windows, which remind one of the Romanesque work at Pisa.

Towards the end of the thirteenth century came a most remarkable change in the window treatment of our great Gothic buildings, "which," as Mr. Prior says in his valuable work on "Gothic Art," "must be judged as no mere freak of a designing architect, but as a revolution worked by Gothic creativeness in some thirty years such as the centuries of Egyptian or Greek art did not accomplish."

Inventors are rarely theorists; the invention must be suited to the necessity before everything, and the theory may follow if anybody cares for it; for a theory is nothing but an attempted explanation, and the fact must exist before it can possibly need explaining.

The history of the development of tracery is so well known that I do not propose to dwell on it now. In its earliest and best stages it was always treated as a part of the whole design, and the masons used their stonework with a due regard for its constructive possibilities. The development of glass-painting in connection with window-tracery is a branch of this subject on which a whole paper might be written.

The lancet windows, especially those on such a grand scale as Chartres and Paris, measuring 6 feet or 8 feet across, made a magnificent field for the glass-painter such as he did not get again till the end of the fifteenth century, when homogeneous Gothic art was a thing of the past. The increasing richness of glass was for a long time only a part of the general scheme of enrichment, and the development of tracery was really due to the mason; but with the rise of individualism, which was one of the main causes of the decadence of Gothic, the extremely decorative character of this form of ornamentation called for wider

Digitized by Google

fields for its display. At Selby the combination of tracery and glass reached such a pitch that the tracery practically becomes the *cloissons* of a great masoned enamel.

With the introduction of the transom to divide these great windows into tiers—each division fitted with niched saints—we seem to feel the desire to recall the great sculpture galleries and fronts of Wells, Lichfield and Exeter. Gradually the glass-painter exercised more and more influence over the mason, and thus we find at Gloucester and King's College Chapel, Cambridge, windows of such a size that the intervening wall spaces are only piers to carry the lofty stone vaults, and these windows, fitted with the magnificent glass of the period, reach the utmost limits of engineering skill in this direction. It is, perhaps, scarcely fair to notice here a modern parallel, but in studying these wonderful examples one cannot help thinking of the modern plate-glass windows of our streets, where the visible means of support are reduced to a minimum, and all the skill and knowledge of material we have at our disposal is utilised to obtain the greatest possible amount of glass space. There is, however, a lesson to be learnt from the two cases which may, for practical purposes, be taken as parallel.

With the Gothic builders the glass itself was set back at a considerable distance from the wall-face on the exterior, and though the mouldings themselves had become comparatively shallow with the growth of the Gothic style, still they were not ineffective, and served to give a certain amount of shadow. In too many instances the exact reverse is the case to-day, and if the great sheets of plate-glass in our modern shop-fronts were recessed their hopelessly bald effect would to a certain extent be minimised. It may be taken as a broad rule that the larger the window the more the glass should be recessed from the outer wall. With the decay of Gothic, which for purposes of classification may be taken as about 1500, a foreign influence began to make itself felt in England, and the interest in the national style, which had been mainly confined to the ecclesiastical structures, was transferred to the domestic buildings after the dissolution of the monasteries under Henry VIII.

Italian art was the first of the long series of outside influences which affected English architecture. The great Renaissance in art and letters may be said to have begun with the fall of Constantinople in 1453, which Mr. Gotch says "flooded Western Europe with Greek scholars and Greek literature. Italy was the centre of the new movement which eventually reached the distant shores of England, but as the stream flowed across Europe it became tinged with the peculiarities of the various lands over which it passed." But before the Classical traditions had really been thoroughly assimilated by the English builders there arose, under Queen Elizabeth, a marvellous growth of stately country houses, in which the followers of the fast perishing Gothic style made their last effort to accomplish something new. The great country houses of the sixteenth century, with their stone-mullioned windows in many divisions, fitted with well-proportioned leaded glazing, are to be found scattered up and down the length and breadth of the country. The wonderful ease with which this form of fenestration was adapted to the great façades of Kirby and Montacute, as well as to the modest gables of the Cotswold manors, took such a hold on the national mind that this style of window may be said never to have completely died out. The Gothic origin of these windows is obvious, and at Cowdray House, in Sussex, the growth is well exemplified. The necessity for a defensible house had by this time disappeared, and the reaction was, like all reactions, inclined to the opposite extreme; and we find, in cases like Astley Hall, Lancashire, and Little Moreton, a range of windows practically dividing the façade into alternate horizontal bands of glass and solid wall surface.

The development of the bay window is also one of the striking characteristics of these times, and they are to be found in all kinds of buildings. From the earliest date we see them almost invariably on the dais of the great halls, and in later examples, as at Bradford-on-Avon, they become the most important feature in the whole composition. The proportions of these mullioned windows is worthy of careful consideration. The single transom was generally placed so that its lower line was nearly in the centre of the window. The proportion of glass to mullion was usually one of mullion to two and a half of glass. The glass-line took the centre of the mullion, and the face of the mullion, if not flush with the external wall, had only a small member beyond it. The mullions were about twice as deep as they were wide. Where more than one transom was used the divisions became less towards the top—with some curious exceptions, as at Kirby Hall. The proportion of the lead-glazing varied considerably. In the earlier type of houses, and in the smaller examples—as, for instance, in the Cotswold district—the windows were small, and the amount of plain wall surface thus produced made up a composition in fenestration which can hardly be equalled for its dignity and sense of repose. In many instances we find that the windows decreased in size and in the number of lights as they ascended the gable, and were kept a long way from the angles. This satisfies the eye—as a logical arrangement—for the mind easily follows the relative size and proportions of the rooms within, and it also gives that peculiar conviction that the house has an inside, much as we can distinctly feel by a glance at a face whether there is really a mind behind it.

As a contrast to the diminishing number of lights as seen in the gables of the Cotswold manors, it is of interest to notice the arrangement of the window openings in the towers of many of the Lombard churches. At the cathedral of Sienna we see the exact reverse of this treatment, and from the single light on the lowest stage of the tower we find an additional light added at every step till at the top there is a range of seven lights, the object probably being not only to produce an effect of lightness but actually to diminish the amount of masonry. Small windows, well placed, undoubtedly make for good architecture, and it is not always possible to convince those concerned that a room can be overlit; the modern building requirements (by-laws) seem especially framed to prevent good proportion, both on account of the placing of the windows in relation to the floor and ceiling and as to their size in proportion to the room itself. These regulations may be of use for ignorant builders in crowded towns, but are sadly hampering in the country districts.

But the Classical ideas which had, by the end of the sixteenth century, gained a firm foothold in the interior of the house, at last showed themselves both in the arrangement and details of the windows, and the outer member of the jamb developed into the architrave, though the mullion and transom held its ground. Woollaton Hall is typical of the transitional period, but the effect of the fenestration cannot be considered entirely satisfactory. It has all the defects of proportion and misuse of Classical detail inseparable from the attempt to combine an imperfectly-understood style with our own traditional methods. But if we consider what a revolution was taking place in all matters connected with art, we cannot fail to pay a tribute to the builders of these great country palaces, which are not only stately and picturesque but essentially English.

(To be concluded.)

TRUE ARCHITECTURE.*

IT is entirely possible for an architect to go through any of the schools of architecture or to know never so well the chronological history of his art, to have stored his mind with great volumes of facts relating to form, colour, decoration, arrangement of details, to have had extensive practice in their imitative use, and yet not understand the underlying principles, the source of architecture. The isolated facts with which he has stored his memory, his theories, examples and the detailed imitative experiences which have come to him are a positive burden without the understanding of principle, without imagination and the constructive sense. They have dulled his vision and hampered the freedom of his movements. As a general proposition this applies alike to all branches of philosophy, science and the practical affairs of life. There must be memory as related to facts and precedents; there must be the training in imitation; but without imagination there can be no creation, and without creation and re-creation there is death.

It is desirable that we should eliminate the strong and deep lines which isolate and divide the arts and sciences into so many parts and classifications. There are certain basic principles, an underlying unity, which relate all our activities. There is a source, a fountain from which all may drink. There must be an artistic unity that there may be free creation.

* From a paper by Mr. Louis H. Gibson, architect, read at a meeting of the John Herron Art Institute, Indianapolis, Ind., and published in the *American Architect*.

Creation is the recognition of something which already exists. Our creation is the result of imagination, perception. We bring nothing into the world. Everything exists for us. Nothing comes into the universe and nothing goes out of it. Everything is here. It is for us to realise. No physical force, no power, no energy is brought into or taken out of the world. It is. The manifestation of electricity in the sky is not the dissipation of force or power. The same force yet remains in the universe. The burning of fuel, the escape of steam takes no power or substance out of the world. There is a mere change in the objective form. The growing of wheat or corn or trees brings no more of physical substance into the universe. There is a mere change of substance, the uniting of forms and substances which make wheat and corn. Nothing comes into the universe and nothing goes out of it. The same is true of the soul force or of the soul stuff, as some one calls it. It is universal. It exists in its ideal completeness. It is for us to realise. It is for us to appropriate. The mere mental force of the world is pre-existent, complete and absolute. The soul stuff, the mental power, the spiritualised physical substance form the universe. In it we may measurably comprehend Divinity through ourselves. Nothing can be taken from it; nothing added to it. It is a constant, unchanging, free, absolute, omnipresent quality.

This force is available. The measure of our creative capacity is our willingness to think in terms of that which is in us, of us and for us. It is only limited by our capacity for freedom. The form which we give our thoughts, our imaginings, is the measure of our tangible, free realisation.

Beethoven brought no music into being. All the music that ever will be in the universe, now is. It has subjective existence. It is the soul fountain. It remains for us to realise it in actual existence, in objective form. Beethoven was an instrument of God. The sculptural representations of a MacMonnies, a St. Gaudens, a Rodin are mere realisations of divinity in form. The pen of Browning touched the fountain of the Infinite. The spirit of the great painter is the spirit of the Eternal One. The great builders of the thirteenth century were free children of the Creator. Each in his own way, in his own measure, expressed the infinite Divinity. His manner of realisation and expression was the indication, the formal definition of personal self-consciousness or consciousness of being.

There is a maximum and a minimum of realisation or identity with the Infinite. From the expressions of the tom-tom to the orchestrations of Wagner there is a great interval. In each there is self-consciousness. In each there is recognition of being. In each there is the touch of the Infinite. Each comes out of the great Universal. It is a part of it. Each is the highest personal expression of the period and the individual. There is the Wagner of the tom-tom and the Wagner of the great artistic unity of Bayreuth. Each realised as far, as extensively as an habitual state of mind allowed. Each rendered further progress and more complete realisation possible. Creation is the giving form to realisation.

Creation is a process of relating, combining pre-existent qualities, forces, facts and substances of the universe in a manner to serve the manifold ethical, æsthetic and utilitarian development of man. Human advancement is human realisation, and realisation is what we call creation. Through our process of realising and combining we bring into being. We make nothing; we do not develop by making something out of nothing. We create by appropriation, by appreciation, by idealising, by seeing, knowing and perceiving that which is of us. There is no creation in the sense of absolute newness.

The distinction which we imply in the use of the terms æsthetic, ethical, utilitarian, is disturbing. They should imply a unity. The æsthetic is utilitarian, the utilitarian æsthetic, and the æsthetic is ethical, and so on. They form a complete unity. Our being admits of no distinction in these qualities, which we define and consider separately and with so much precision.

Few of us realise our capacity as creators through the faculty of appreciation. We appreciate to-day that which meant nothing to us yesterday. To us this appreciation is creation. The musician brings something to us, and in so far as we appreciate we ourselves are musicians and create for ourselves, increase our capacity, enlarge our horizon, draw from the eternal fountain, appreciate. The painter places before us a picture. Our realisation of its meaning, our understanding, our appreciation, expresses artistic consciousness. We are literary artists, we are creators as measured by our understanding of that which comes to us through literature. Appreciation is one great source of creation.

Of all the arts the art of architecture is the least alive. It rests almost wholly upon the traditions of the past. It is the only art where respect for precedent implies bondage. We have music to-day than which the world knows none better. We have literature which is in no way controlled by the past, by memory. We have great paintings not yet dry upon the easel. Sculpture is modern and expressive of present day emotions. It is not imitative. The architecture of the Greeks expressed the sentiment and culture of their civilisation; that of the Romans was expressive of Roman character. It stood for organisation, formula, authority, academic methods, control. The Mediæval architecture was expressive of religion and the sentiment of the Infinite. The period of the Renaissance—the fifteenth and sixteenth centuries—was identical with the spirit of research and the retrospective view. The sentiment and culture of the Greek, the religion of the Mediæval time and the spirit of research of the Renaissance were idealised and materialised in a great way in architecture. The spirit of the present is not expressed in our architecture. We clothe our thoughts in the tattered, objective garments of the Greek, the Roman, the Mediæval, the Renaissance period. Our present-day architecture has no subjective thought which manifests present-day spirit or life.

The art of the builder was never so exalted as during the thirteenth century. The craftsman and the artist never joined hands more seriously or joyously. Never in history did they express themselves in greater enthusiasm. There was a great and compelling reason for this sympathetic and loving relation. The artist and the builder were serving a people united in a declaration of spiritual and intellectual independence. They were taking part in a great racial expression, and their monuments were commemorative of individual freedom and an illumination of the soul which delivered them from the Dark Ages. They were idealising, expressing in material form their enthusiasm, their gratitude and hopes of a new democracy. The thirteenth-century architecture was the flower bursting from the bud of 800 years of repression.

As we look into the history of architecture we are astonished by one great fact. The greatest art was developed absolutely without precedent. Greek and Mediæval art were born full strength into the world. This is as relatively true of Roman as it was of Renaissance architecture. Each period had its own origin, and each created its own bondage. The Mediæval art was a proclamation of spiritual freedom. It died from spiritual and intellectual bondage. The Renaissance was a symbolic expression of secular freedom and intellectual research. The Renaissance created its bondage by the exaltation of precedent. The period of the birth of these arts is the period from which to date their decline. Greek architecture was the greatest in the fifth century before Christ, the Mediæval early in the thirteenth, the Italian Renaissance in the fifteenth, and that of France in the sixteenth. Everything that has been done since by the architects has been relatively inferior. It remains for the architect of to-day to clothe the new, virile thought of our time with the objective architectural garments of the past.

In a country so small as France the architecture of the thirteenth century preserved the same initial principles throughout its territory, and yet presented the individual character of the various provinces. When at the end of the century the architectural expression amalgamated, when it lost its personal quality, it lost its fineness of expression, its exquisite choice of form and detail. When it lost its personality, it necessarily lost its real art, its character.

Conscientious and honest employment of material distinguish the construction of the thirteenth century. It charmed the cultured world and the uncultured. Nothing less than false education will cause one to lose respect for a true, natural law. Again, there is no human work which does not contain within itself the germ, the principles of its own dissolution. Merits, if exaggerated never so slightly, soon become defects. The art of the thirteenth century was the art of individuality. There came a time when reason replaced imagination, logic dispelled poetry, science encroached upon fancy, and calculation displaced inspiration. It is then that the dreamer is displaced. It is then that the art of the builder, the builder God within us, is dead.

The spirit of true architecture of the Mediæval period

Digitized by Google

went out at the end of the thirteenth century. During the early part of that century there was individual freedom and therefore national expression. Through individual freedom is found the highest expression of national genius.

Only in the architectural art do we feign the expressions of the past. In discussing literature we do not ask the period of the author's work nor consider his fidelity to an earlier style. Think of Kipling relating himself to the Elizabethan period. We should not know him if he did. It has remained for the modern painter to discover colour. They have their masters in name only. The sculptor is free, yet respectful of tradition. Wagner revered Beethoven, yet proclaimed his own message. As said before, architecture is the only art where respect for tradition or a school implies bondage.

Think of the relation of architecture in the lives and history of a people. The architecture of Egypt is Egyptian; the architecture of Greece is an expression of the intellect of that time; that of the Romans was governmental, formal, academic, aggressive, dominant. The Mediæval architecture was the first democratic art. The architecture of the Renaissance was the spirit of that time.

The spirit of domesticity is a dominant force of our time. Never before in the history of the world was it so strong and individual. The love of home is a sentiment high enough and strong enough to form a nucleus of great art. Emotions which originate in family attachments and home life are serious enough and delicate enough to be the germ of an architecture as fine and as expressive as that of the Greeks, and as beautiful and joyous and picturesque as that of the thirteenth century.

Great architecture has always been the expression of high sentiment. Greek architecture was the expression of an advanced intellectual condition. Gothic architecture was developed from great religious emotions and the exaltation of the realisation of intellectual freedom. True architecture must come from a strong impulse. Our opportunity is the idealisation and the materialisation of the spirit of home life. Architecture may spring from the family and express all that is beautiful and tender and noble in family love. This cannot be done in temples or castles or great cathedrals, because the sentiment which develops these is wanting. The spirit that built the cathedral is now in the home. Architecture may be an expression, material in form, of the family sentiments. It will relate to the love of men and women and children and youth and old age.

How does one build to express a sentiment? How does he represent veneration for family life? How does he express in wood and brick and mortar the love of men and women? These questions are direct enough and practical enough. In all history there is no sentiment so high that it has not been given adequate material expression. Every building must exist in thought, in hope and ambition before it can exist in substance. All the beautiful sentiment of the home has been and may be expressed in infinite variety, in beauty of form, harmony of colour, picturesqueness of outline, delicacy of detail, in proportion and mass, through enduring material and honest handicraft. The most godlike of human emotions have found, and may find, physical expression through the medium of material, form and colour.

There is a great opportunity in building a house which is to serve as a home for expressing artistic unity. To begin with, there are the general sentiments which we all so well understand and which we so inadequately express. Within the expressive house there may be music and painting, sculpture if you please, literature and the appreciative spirit which makes us a part of them. The ideal home can be better expressed by an example than a definition. One who is interested in domesticity and home-life and home-building can find nothing more charming and satisfactory than the history of Sir Walter Scott's homes and home life. Everything around him partook of his own sweetness of character, and at the same time was rendered picturesque by those qualities of mind which belonged so much to him. There was the element of romance in everything that he touched. Abbotsford was a narrative, and in it and through it ran the poetry of his nature. But his home-building character had an earlier demonstration than in that completed structure. Abbotsford was its culmination. One of his homes was an old border tower, and in its little sitting-room he wrote with children, wife, servants and dogs around him, sitting in the little bow-window which looked out on the Tweed. The first house at Abbotsford was a simple cottage. The ground around it was bare of trees, but it was immediately set with slips and planted with seeds sent by his friends from all quarters of the globe. With the success of his novels Scott changed his plans many times. The building moved along with his resources, but the home spirit was never lost during its transition from a cottage to a castle.

One can see in Abbotsford the same idea which brought forth his poems and novels. Antiquarian research formed the basis of both. An old legend, a queer or interesting character, combined with ideas of his own, in his inimitable way, formed the poem or novel. A block of stone from the door of Tolbooth Prison, bits of carving from Melrose Abbey, carved wood from Dunfermline kirk, mosaic pavements from Italy, built together with new stone, placed in the form suggested by Scott's imagination and historical research, formed a building picturesque and romantic as the "Lady of the Lake." One cannot but feel that Abbotsford was to him more real than his literary work. It combined the legends of his country and the romantic, imaginative qualities of his own mind in material form.

When we look at an architectural production like Abbotsford Castle, the most natural question to ask is, What style of architecture is it? In truth, Scott's castle is as varied in its style as the legends with which he stored his brain. It is a kind of architectural romance, altogether picturesque and varied. There are in it suggestions of the heavy Norman architecture of the twelfth and thirteenth centuries, and alongside this, and at times a part of it, we have Elizabethan details and suggestions of the Perpendicular style, and again choice bits of the Early English, all arranged in a most picturesque and pleasing way. Thus we have an architectural romance constructed exactly in the same manner as his literary productions.

The buildings of the Old Colonial period were the truest architectural expressions that America has known. The medium was a Renaissance departure; yet material, colour, form were idealised and inspirited to express Old Colonial life. It was careful, thorough, academic house-building. The old New England dwelling or meeting-house and New England history and character are part of the same expression. We know the early New England people as thoughtful, refined in a way, very severe and exact. We find the architecture of that period expressing as clearly as possible all these qualities. There is no suggestion of the picturesque either in the personality or the architecture. There is no mere prettiness. It is truthful, severe and refined. It carries with it a certain reserved, dignified, quiet beauty and nobility which comes from seriousness and concentration. We architects undertake to build Old Colonial houses to-day. We memorise Old Colonial details and imitate the forms. We do not supply the character—the Old Colonial character. No more do we produce the architecture. A musician does not produce a sonata by memorising and imitating the work of a Beethoven. There must first be the spirit of a Beethoven. Architecture is not creative; it is created. Architecture as an art cannot exist for its own sake. We must be artists in thought before we can be artists in manual performance. The manual expression is the end, not the beginning. We may have certain trained cells which see and represent the skin of things. But dominating all arts, except the art of music, is the art of thinking. When a thought takes outward form so as to be conceivable by the human mind, it is a word, a thing. The word is the symbol of creation. A word, a thought, is the verimost reality—the greatest essential in the universe. The thought, the word is the expression of the spirit. Painting, architecture, sculpture, literature are materialised ideals. The actual performance is only the expression of thought. One who touches the violin must have something to say—a thought, a something high. It is well to remember that the ability to draw and colour does not make the painter. There are greater draughtsmen and colourists in the world than Millet. But Millet had the thought. He knew the word. It is not necessary that we should have great manual dexterity in order to be artists. We may be great artists in our thinking. It is desirable that we should be able to manually write or even be able to spell in order to produce literature, but it is by no means necessary, though very convenient. We must have the imagination, the thought.

There was a time when Greek and Mediæval and Renaissance art was L'Art Nouveau. The perception of its beauty was the fatal moment. It then ceased to be an unconscious expression. Convulsive clinging to æsthetic effort means loss of real mastery. Our Art Nouveau carries with it a suggestion of failure. It is an exaggerated expression

Digitized by Google

of self-consciousness. In that it clearly expresses a distorted self-consciousness, it is effective. In that the expression of this condition of mind is not desirable, such an expression is out of place. A thing out of place is never true art. The true new art will come without a convulsive birth—unconsciously, from the natural expression of present-day emotions and thought. New art is the expression of new thought; the now, and not the taking on of a new skin.

In detail, in colour, as expressed in ornament, L'Art Nouveau is often very beautiful. The beauty is hectic. It covers a badly organised structure. The engineering is generally bad and the forms and compositions forced.

The present-day craftsman's work has the merit of presenting a free opportunity to study form, composition and craftsmanship without the consideration of ornament. At this time, when we are so lacking in reserve, this is a desirable opportunity for restraint. Some day we will unconciously combine the simple, rational qualities of the craftsman with the decorative sense of the new art and thus produce real art.

There is no doubt about our present-day architecture being frozen, but I will not allow that it is frozen music. Music is infinitely more free than the art of thinking. Music ignores ideas, and therefore is not dependent on the perceptible or what we choose to call the natural world. Music is the image of the will. It speaks of essentials and the other arts of shadows. The same identical will shows itself in ideas as well as in music, though in a totally different way. There must consequently be a parallelism, an analogy, though by no means an immediate likeness, between music and the other arts. Music is not represented by the body, but purely by the inner soul. It is the heart of things—the highest art. It represents the metaphysics of all that is physical in the world, the thing that lies beyond appearance.

A church is a place for a great gathering together, a great opportunity for the unified artistic expression of the real being, the "I am," of a body of people. Such an expression is inherently the highest form of art. In so far as it is true, it is great art. In a meeting-house there may be worship through literature, architecture, oratory, music, painting, sculpture and ceremonial in all its manifestations. It may be a unified art incarnate.

In everything which we do, our daily work, our art, our building, is a manifestation of some primal life, some central living power or central spiritual control, call it by what name we will. In a finite expression we manifest the infinite. All material things are only the outward expression of a spiritual reality and an essence which represents it to the senses, an outward, visible sign of inward spiritual emotion—man's expression of the eternal. Our work is an expression of soul—a revelation. Think of the responsibility. We do this with material which we find at hand, plus the infinite, plus thought.

REINFORCED CONCRETE.

THE following statement, which was read at the first meeting of the Concrete Committee, consisting of representatives of the R.I.B.A., the District Surveyors' Association, the Institute of Builders, the Incorporated Association of Municipal and County Engineers, the War Office and distinguished scientists, gives an idea of the nature and scope of the investigations the committee has been formed to carry out:—

This committee has been nominated by the Royal Institute of British Architects to consider and report upon the use of reinforced concrete in buildings and other structures. As we all know, reinforced concrete is largely used in other countries—in America, France, Germany, Italy, Russia Egypt, &c.—and is now coming into use here, but very slowly.

The conservative nature of our people may be responsible for part of our reluctance to use reinforced concrete, but another reason why we lag behind is that no responsible or representative body of skilled men—no one man even whose name carries great weight—has pronounced in its favour. Also Building Acts and by-laws do not facilitate its adoption. The architect and engineer hesitate to use it until the material and what can be done with it has been generally agreed upon; until, in fact, they have some assurance that it may safely be employed.

Now, as the Royal Institute of British Architects has been the promoters of this committee, you may naturally look to its representatives for some general idea of the line of action to be taken. Exactly what may be done must be settled by the committee itself; and in submitting to you a general rough sketch idea of a programme, it must be understood that the sketch is necessarily only an introduction, and not in any way a finished scheme, for your guidance.

First, then, it appears that we should inquire into what has been done already, and ask the owner or architects or engineers of such work for particulars, and how the buildings have stood the test of time.

We shall have a secretary who can apply to railway companies, owners of mills, private owners, architects, engineers and others, who will no doubt willingly place the results of their experience at our service. Some of us may visit works, some have actual experience in the new system, and when we have digested this knowledge we can as a body express an opinion as to its usefulness, its safety, its permanence and other qualities, which opinion we may fairly hope will be of value to our fellow countrymen.

Something of this kind has been done already in other countries. The German Association of Architects and Engineers in conjunction with the Concrete Association have drawn up a report; the American Institute of Civil Engineers in conjunction with various other bodies have appointed a committee which is at present engaged on similar work, and it is suggested that we should apply for copies of such information or interim reports as may be at its disposal; the French Government also is said to have appointed a committee to prepare a set of recommendations.

A general expression of opinion as to its value would not help other architects or engineers very much; we should therefore consider and report upon the following amongst other matters, as to which there is doubt:—

1. Whether such constructions are permanent or likely to deteriorate with time. The steel skeleton is said by all those who have studied the subject not to rust, and even when steel is imbedded in a material such as coke-breeze concrete containing a proportion of sulphur there is said to be no rusting. As any reduction in the section of the metal by rusting might endanger the work, we should consider if it ever does rust and under what circumstances, so as to advise upon any necessary precautions or to reassure the doubters on this head.

2. The resistance to fire. We shall have to consider what has been done in experimental tests such as those of the city of Hamburg authorities in 1895 and of the British Fire Prevention Committee just made. Also the results of tests in actual fires in buildings, such as the Baltimore fire, where the conditions were exactly those we have to provide against. We may thus be able to form definite conclusions of value to all interested.

3. The method of contracting. There are about fifty different so-called patent systems, and it is usual to entrust the design of any proposed work to one of the firms who make a specialty of this class of construction, obtaining from that firm a guarantee of strength. This arrangement is probably quite desirable, but as a certain responsibility must always lie on the engineer or architect who accepts or recommends for acceptance any such design, it is desirable for us to define as best we may the responsibility of the parties.

For instance, it may be made clear that the contracting firm undertakes all responsibility; you may consider it wise to require that the drawings should first be submitted to the architect or engineer, and should be signed by the contracting firm or by some responsible person on their behalf. Some firms try to make a secret of their system and object to showing the drawings.

It may appear to you that to accept a plan for floor or roof or wall or column or bridge or water-tank (all matters of construction in which we are supposed to be skilled) without making ourselves acquainted with what is to be done is dangerously foolish; and if so, your opinion may have sufficient weight to settle that question. Captious interference we should all deprecate, of course, but the engineer or architect must be in command, and must know not only what is proposed to be done, but how it should be done.

We can still leave ample freedom to the experts in the design of the work, in the choice of material and method of carrying out the work.

4. The materials also will no doubt be considered. These are:—

(*a*) The metal, iron or steel.

(*b*) The cement.

Digitized by Google

(*c*) The sand.

(*d*) The aggregate, ballast or stone, &c.

For the steel and the cement we shall have the standard specification of the British Engineering Standards Committee, and must inquire if qualities of the standard kinds are suitable for reinforced concretework.

As to the sand, you know how universally the qualities of good sand are given as clean and sharp. We have to review all that in the light of recent knowledge. In America many experiments have been made which show that cleanness is not so all-essential as has been supposed, and that washing does not improve every sand. These results were arrived at by experiments on material not only seven days or twenty-one days old, but were made on pieces of various ages up to three years.

Certain work in that way is being done here, and when we have collected and considered the facts our opinion based on knowledge should be of value.

Next as to the sharpness. You may find that sharpness is not so important as variety in size of the grains of sand. Compactness and freedom from voids appear to play a most important part in the strength of mortar, and that freedom from voids may best be obtained by variety of size. These questions we should study with an open mind, free from ancient prejudice.

Then there is the aggregate of stone, gravel, coke-breeze, &c., what proportion to use, what material to use to get the best results in given cases. If we find that washing the sand may be saved, and that concretes of leaner mixture may be used than hitherto with equal safety, we shall have done some good.

Questions arise as to the mixing. We want to know what is the proper way to mix our concrete; how much water to use; whether the sand, gravel and cement should all be mixed together and the water added, or whether the sand, cement and water should be made first into mortar and the gravel or stone added, as recommended by some. We want to know the value of mixing machines, and whether it is wise to allow a smaller proportion of cement, say 10 per cent. less, if the concrete is mixed by machinery, owing to the fact that it is better mixed. Into all these we must inquire, so as to be able to advise our brother architects and engineers.

5. Another subject is the carrying out of the work. Should we require that only skilled men under skilled supervision be employed; that the work be kept wetted, be stopped in frosty weather; how long the centres should be kept up, &c.? All these can only be indicated as matters for your consideration and judgment, and upon which an authoritative pronouncement would be desirable.

6. One important question which we must consider is what are the safe stresses to allow in various cases. There is apparently no such general agreement upon the safe stresses and methods of calculation as we find in regard to steel or iron, and it is possible that in the present state of knowledge we cannot tell with sufficient accuracy what are the internal conditions in a non-homogeneous beam to enable us to determine rules which are not open to criticism or improvement with the advance of experience.

Reinforced concrete is, however, being used, and there is need of rules—tentative though they may be—to guide us until we get formulæ which will command general assent. Much has been done in the way of experiment in recent years, so that we are in a much better position to test any of our theories by the results of actual work.

It may be found desirable to refer this part of our subject to a sub-committee of those amongst us who are specially qualified by reason of their mathematical attainments to pronounce upon it.

Our commission is limited to preparing suggestions and recommendations, and therefore any report that may be made will be in the way of advice, and not as fixed and immutable rules.

How far our Building Acts and by-laws should be altered to permit of the use of reinforced concrete walls may also be considered, because as they stand they interfere with the reasonable use of the material.

There is a general feeling that our regulations as to walls should be relaxed in all buildings, at least in rural districts. The agitation for reform in this respect has not yet spread to urban districts, save in regard to the material we are studying; and it certainly seems that if the strength is increased by the use of a metal skeleton the thickness of a concrete wall may be correspondingly reduced.

We fortunately have with us municipal and county engineers and district surveyors whose experience in the working of these by-laws will be of value in restraining too much reforming zeal should we display it.

All the questions thus briefly reviewed are matters upon which the general body of architects and engineers and others interested would no doubt value the consensus of opinion of skilled and disinterested men who have studied the subject. Such an opinion will help the introduction of the material by giving those who hesitate to employ it through want of knowledge, and fear of the responsibility, the assurance of the conditions under which it may safely be used, and give that confidence which is at present lacking. It will call attention to its advantages where it has any, such as road bridges over railways, which at present deteriorate rapidly with rust.

MANCHESTER SOCIETY OF ARCHITECTS.

THE forty-second annual meeting of the Manchester Society of Architects was held on the 25th ult., Mr. J. H. Woodhouse, the president, in the chair. The Council reported an aggregate membership of 223, as against 219 at the date of the last report. Under the will of the late Mr. A. W. Mills the Society had bequeathed to it a legacy of 8,000*l.*, to be raised out of the residuary fund after the death of his wife. Of that sum 5,000*l.* is directed to be set apart and invested so as to produce, as far as practicable, a certain and permanent income therefrom for the benefit of the Society. Mr. Mills further provided that his trustees should select such of his plate, books, pictures, furniture, &c., as would be suitable for the purpose of furnishing a building or rooms for the use of members and students or for ornamental or instructive purposes in any building or buildings belonging to or under the control of the Society. The Council had received such articles from the trustees to the value of about 1,000*l.*, and they were now stored until arrangements could be made to obtain suitable premises for the use of the members. The financial statement showed an adverse balance of 24*l.* The report and accounts were adopted, and Mr. J. H. Woodhouse was re-elected president. The other officers were also elected.

GENERAL.

Mr. Alan H. Gardiner, late scholar of Queen's College, has been elected to the Laycock Studentship of Egyptology at Worcester College, Oxford.

We regret to announce the death of Mr. Thomas Garner (late of the firm of Bodley & Garner), who died on Monday last from heart exhaustion following an attack of influenza.

The Chester Corporation invite from local architects suggestions (with pencil designs) as to how additional office accommodation required for the Corporation can be best provided, with a statement showing the approximate cost of any scheme suggested. Particulars can be obtained from the town clerk. Suggestions, with designs, should be sent in not later than the 31st inst.

The Works Committee of the Marylebone Borough Council have approved a site in Langham Place, Regent Street, near the Polytechnic Institution, which he founded, for the proposed statue of the late Mr. Quintin Hogg, which is to be erected by Mr. G. J. Frampton, R.A., of St. John's Wood.

The Suffolk Institute of Archæology have decided to ask the incumbents of the 528 ecclesiastical parishes in the county to transcribe the inscriptions on all tombstones in their churches and churchyards, so that a permanent record may be kept. Disintegration of the stones, especially on the coast, is found to be very rapid, and many interesting memorials and inscriptions have been lost within the last few years.

The Carnegie Dunfermline Trust, on the recommendation of the joint art committee, which is composed equally of representatives of the Burgh School Board and members of the Trust, have agreed to make application to the Education Department for a grant of 3,000*l.* towards the erection and equipment of a building estimated to cost 5,000*l.*, to be used as a School of Weaving and Design in Dunfermline, the Trust undertaking to provide the balance of 2,000*l.* besides a suitable site.

The Holborn Town Council have postponed for three months the further discussion as to the fate of the Holborn town hall.

The Members' Dinner of the Architectural Association will be held on the 17th inst. in the Georgian Hall, Gaiety Restaurant, Strand.

The Following Additions have recently been made to the National Gallery:—"The Fortune Teller," by George Morland, bequeathed by Mrs. Behrend; "Venus and Cupid," by Velasquez, presented by the National Art Collections Fund. The three following pictures which were lent to the National Gallery of Scotland since 1862 have been returned to Trafalgar Square and are now hung in Room XV., together with a small picture of "The Virgin and Child," ascribed to Martin Schoen, which was formerly hung in the board-room at Trafalgar Square:—"The Conversion of St. Hubert," by the Meister von Werden; "The Adoration of the Kings," by the Meister von Liesborn; "The Annunciation," by the Meister von Liesborn.

Sir Robert Lloyd Patterson, of Croft House, Holywood, near Belfast, president of the Belfast Chamber of Commerce, 1880-95, has bequeathed his bronzes and pictures to the Belfast Free Library Art Gallery, and 6,000*l.* to the Belfast Corporation for providing proper and adequate accommodation for such articles.

Mr. Anthony G. Lyster, engineer in chief to the Mersey Docks and Harbour Board, has been nominated a member of the Consultative International Commission of Works of the Suez Canal. Mr. Lyster has been chosen to take the place vacant by the retirement of Sir John Wolfe Barry.

The American Consul at Munich has published statistics of the picture export trade to the United States. In the year 1905 paintings in oil and water-colours to the value of 135,955 dols. were exported to America from Munich alone. In 1904 the value was 120,228 dols. The exports of pictures to this country from Berlin in 1905 were valued at 70,038 dols.

Mr. Hugh P. Lane, under whose direction the collection of pictures on exhibition in the Free Library, Belfast, has been brought together, has made an interesting offer to Belfast. Out of the 150 pictures on view, valued at about 70,000*l.*, some forty of them are for sale, and may be had on special terms if secured for public collections. Mr. Lane has made a selection of about twenty, which he would propose as the basis of an art gallery, and the price of which amounts to nearly 5,000*l.* If, however, 2,500*l.* worth of them are presented to the proposed gallery he is prepared to give pictures out of his own collection of a not less value than 500*l.*, in proportion to the value of those given.

Mr. Thomas Hoade Woods, senior partner of Messrs. Christie, Manson & Woods, auctioneers, London, left net personalty 483,945*l.* under his will. There is a contingent reversionary bequest of 30,000*l.* amongst the Artists' Benevolent Institution and other institutions.

The Trustees of the Whitechapel Art Gallery in their fifth annual report state that they are considering exhibitions of animal pictures, Mohammedan art, Jewish antiques, the history of the means of locomotion, and Old London. These may extend over years. They add that they have at times been tempted to pass over the gallery to public management, but a majority of the trustees have felt that under independent management the possibilities of usefulness are greater.

The Ballot for the election of officers of the Institution of Civil Engineers has resulted in the election of Sir Alexander B. W. Kennedy as president, Mr. W. R. Galbraith, Mr. William Matthews, Sir E. Leader Williams and Mr. J. G. Inglis as vice-presidents. The Council of the Institution has made the following awards for papers read and discussed before the Institution during the past session:—A Telford gold medal to Mr. J. A. Saner, a Watt gold medal to Mr. G. G. Stoney, and a George Stephenson gold medal to Dr. T. E. Stanton; Telford premiums to Mr. Leonard Bairstow, Mr. H. S. Bidwell, Mr. J. J. Webster, Mr. Cathcart W. Methven, Mr. H. A. Mavor, Sir Frederick R. Upcott, and a Manby premium to Mr. D. E. Lloyd-Davies.

A Work by Miss G. Isherwood dealing with "Monumental Brasses in the Bedfordshire Churches," with illustrations drawn from rubbings, has been published by Mr. Elliot Stock. The churches are dealt with alphabetically. Each brass is carefully described and an historical account is usually given of the person commemorated, together with the inscription. There are no very remarkable brasses in Bedfordshire, but this does not detract from the value of the small work as a county record.

The Authorities of the Berlin Museum have refused to lend the six panels which formed part of the "Adoration of the Lamb" by the Brothers Van Eyck, and which were required in order to display the complete work in a proposed exhibition at Ghent.

The Edinburgh Town Council on Tuesday approved of the recommendation that the use of Saughton Park and grounds should be granted for the Scottish National Exhibition in 1908.

M. Bussat, one of the municipal councillors of Paris, is about to propose the creation of a "Museum of Social Art" in one of the districts of the city where the working classes abound.

Members of the Society of Architects will to-morrow (Saturday) visit the Ilford Crematorium. Mr. A. C. Freeman will guide the party.

The Chapel of the Order of St. Michael and St. George, in St. Paul's Cathedral, will be opened on June 12. It is expected that the King will be present.

Messrs. Doulton & Co. will have open next week at the New Dudley Gallery, Piccadilly, an exhibition of new effects in pottery.

An Examination to qualify for membership in the Society of Architects was held in Manchester and London from April 10 to 12. The following have satisfied the examiners, and are entitled to make application for membership:—H. C. Anderson, E. E. Barks, A. H. Dungay, W. Fenn, H. W. Meech, A. Race, A. J. Stringer, A. C. Veale.

Messrs. Josiah Wedgwood & Sons, Ltd., have decided to open a museum at their works at Etruria for the purpose of exhibiting the old Wedgwood ware in their possession, together with the moulds, &c., used for its production and the pattern and account books relating to the great potter's business transactions.

Mr. John Brooke, who died suddenly in Chelsea, was an assistant to the late William Morris and Burne-Jones. Afterwards he was associated with the Minton studio. He was engaged to write a report on the art tiles and mosaics of the Paris Exhibition of 1889.

On Saturday, April 21, fifty of the building trade students and teachers of the London County Council Camberwell School of Arts and Crafts inspected the brick-making works of Messrs. Eastwood & Co., Ltd., at Conyer, Teynham, Kent, when by the kindness of the firm they were hospitably entertained and shown, under the guidance of Mr. Alfred Wragge, the various processes by which perfect stocks can be turned out in seven days. A most instructive day was spent by the students, and the firm is to be congratulated upon the successful results of their efforts to provide such interesting practical instruction. The school has to thank Messrs. Eastwood for the public spirit they have shown in gratuitously supplying it, for lecture purposes, with a complete set of bricks and cement, together with specimens of the raw materials.

The Annual Report of the Amalgamated Society of Engineers says the year was one of steady improvement in trade and also one of steady improvement in the Society. The exports of engineering products during the year exceeded all previous records, and reached the total of 23,267,621*l.*, as compared with 21,082,502*l.* the year before, which was also then the highest on record. It was, says the report, a very satisfactory indication of trade prosperity, so far as that prosperity could be said to depend upon the foreign trade. It showed that whatever the future might have in store for the engineer so far as trade with foreign countries was concerned, the British engineer was as yet keeping up the pace very well.

Dr. G. G. Revay, of New York, with several members of the staff of the United States Steel Corporation, is visiting Europe to inspect a number of plants which may furnish ideas useful in planning some parts of the company's important projected improvements. He also proposes to look into several electro-chemical processes while in Europe, with a view to their introduction into the United States.

The Streets and Buildings Committee of the Town Council of Edinburgh have considered the estimates of revenue and expenditure for the ensuing year. Under the heading of streets, footpaths and public safety, the estimated net expenditure is 53,605*l.*, compared with an estimated expenditure of 54,675*l.* in the year 1905-6 and an actual expenditure of 54,194*l.* in the year 1904-5. Under the heading of sewers and drains, the estimated expenditure is 29,175*l.*, compared with 28,945*l.* in the previous year and an actual expenditure of 28,104*l.* in the year 1904-5. The capital expenditure on streets and buildings is estimated at 15,010*l.*, to be incurred chiefly in connection with a bridge at Tynecastle, a sea wall at Joppa and various new sewers.

A Large Convent is to be erected near Ryde for one of the orders of refugee nuns from France. The plans will be prepared by Mr. G. Goldie.

The Architect.

THE WEEK.

IN the course of his speech on Saturday at the banquet of the Royal Academy, the President expressed regret for the loss which had been sustained by the death of Mr. ALFRED WATERHOUSE. He was, said the President, "one of the most successful architects of our day, who has left behind him many important buildings to preserve his fame, among which the best known to those present will be the Natural History Museum at South Kensington. Not only his gifts, but a singular charm and urbanity of manner, accentuating his talents as a man of business, made him exceptionally pleasant to deal with. An attack of paralysis, due no doubt to an excess of hard work, deprived us of his services as treasurer many years ago, and his loss was on all grounds felt by his colleagues." In announcing the appointment of Dr. SPENCE-JONES, Dean of Gloucester, as professor of ancient history—an office first held by OLIVER GOLDSMITH—the President referred to the Dean's love and care for his cathedral during twenty years. Sir EDWARD POYNTER finally took advantage of the opportunity to advocate the Strand improvement, and he said:—"I cannot believe that the body which was so earnest to save the view from Richmond Hill will let slip this golden occasion, one which so rarely occurs, of adopting a scheme which shall be worthy of our great Metropolis—a scheme which can now be carried out without difficulty, but which, if it is rejected, will be lost for ever." It remains to be seen whether the London County Council, after so large an expenditure on changing the character of the Strand, will hesitate to accept the slight loss which improvement of the building line will involve.

ORDINANCES and regulations have been approved for conferring degrees in Applied Science by the Sheffield University. The degrees will comprise:—Bachelor of Engineering (B.Eng.), Master of Engineering (M.Eng.), Doctor of Engineering (D.Eng.), Bachelor of Metallurgy (B.Met.), Master of Metallurgy (M.Met.), Doctor of Metallurgy (D.Met.). Candidates for Bachelor of Engineering degree must furnish certificates of having passed the matriculation examination of the Joint Board of the universities of Manchester, Liverpool, Leeds and Sheffield, or an examination accepted by the Board as equivalent to the matriculation examination, and of having attended for at least one university year subsequent to matriculation a course of study approved by the university in each of the subjects in which they present themselves for examination. There will be an intermediate examination in (1) pure and applied mathematics; (2) machine drawing and design; (3) engineering, Courses A and B; (4) physics or chemistry. The final examination will be in five subjects selected from the following:—(1) Pure and applied mathematics (compulsory); (2) mechanics of machinery and materials of construction; (3) hydraulics; (4) heat engines; (5) civil engineering and surveying; (6) civil engineering design; (7) general transmission and distribution of electricity; (8) design of electrical machinery and apparatus; (9) workshop practice, theory of machine tools; (10) machine drawing and design; (11) geology. For the degree of Bachelor of Engineering with honours it will be necessary to pass in a higher standard in two out of the five selected subjects. The examinations in metallurgy and mining are severe. There will also be Associateships in the Faculty of Engineering. The fees to be paid for the various examinations and degrees will be:—In the Faculties of Arts, Pure Science and Applied Science.—Examinations: For the intermediate examination, 1*l.*; for the final examination, 1*l.*; for re-examination, 5*s.* in each subject. Degrees: For the Bachelor's Degree, 5*l.*; for the Master's Degree, 5*l.*; for the Doctor's Degree, 10*l.*

THE curator of the Walker Art Gallery, Liverpool, Mr. A. RIMBAULT DIBDIN, has presented a report on results of the visit of representatives of the Corporation to studios and exhibitions in London in order to make arrangements for the next autumn exhibition:—"The general impression resulting from the labours of the deputation is that while the imagination, skill and technical achievement of painters and sculptors are maintained at a very high level, there is evidence of a disposition on the part of painters to refrain from undertaking important subject pictures, the reason frankly advanced for this being that the present fashion of buying at large prices works by (or ascribed to) old masters has practically put an end to the encouragement of modern art by wealthy patrons. The Chantrey Trustees and municipal galleries are now, it has been stated repeatedly, almost the only patrons for large subject pictures. While important works of that genre are comparatively few, there are many excellent landscapes and portraits. Artists who use water-colour, tempera, pastel, &c., showed the deputation a number of interesting and desirable works. Most sculptors are apparently very fully occupied at the present time with important commissions. There should be no difficulty, however, in obtaining the small amount of sculpture which is all that can be shown to advantage in the present exhibition rooms." It is proposed to include in the autumn exhibition drawings in black and white, engravings, lithographs, colour prints, pastels. The prejudice against work of the kind has endured too long. In France and Germany lithography of all kinds is recognised, and able painters do not consider it undignified to draw on stone. Only rich people can now afford to purchase works of art. But the desires of others who have not much money to spend should also be considered. We hope the Liverpool experiment will be tried and become a success.

THE technical instruction in some of the institutes of the London County Council is to comprise additional subjects. In the Central School of Arts and Crafts provision is to be made for the training of boys who intend to enter the silversmith's or kindred trades. The course will be a wide one, including elementary mensuration, geometry, geometrical drawing, freehand and model drawing, clay and wax modelling, elementary science, English composition, history, geography, workshop drawing, the technology of metals and tools and bench-work. The practical work is to comprise filing, piercing, jointing, smithing, square boxwork, mounting, blow-pipe work, the use of small hand tools generally, chasing, metal carving and analogous operations. The course will normally extend over a period of three years. At first twenty boys will enter the classes, ten having free studentships, while the others will pay 30*s.* a year. Day classes are to be opened experimentally for apprentices of the furniture trades in the Shoreditch Technical Institute, with the approval of several employers. It is suggested that a class should be opened for eight students in September 1906, on any afternoon except Saturday for three hours, the time of meeting being fixed to suit the majority of the students. The instruction given will be partly in the workshop and partly in the drawing office. The practical work will be arranged so as to associate the principle of cabinet design more closely with actual workshop practice. The drawing office work will be specially suited to the needs of working cabinet-makers, and will include the theory and practice of workshop drawings. The cost of the class, including the salary of the teacher and the outlay on materials used, will probably be about 100*l.* The builders' quantities class in the Westminster Technical Institute is to be held on an additional evening.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

THERE are three designs in the room by Mr. T. G. JACKSON, which are placed together in positions which generally give dissatisfaction to those whose works are found there. One is a "New Entrance to Danby Hall," which is Elizabethan in style. Another is the "Chapel for Giggleswick School," which is surmounted by a sort of simple domical structure. The third is the "Enlargement of Billinge Church" by an interesting approach. Mr. AITCHISON does not exhibit. Mr. BODLEY sends the first design for a monument of the late Marquess of SALISBURY, which is curious from the introduction of three figures of bishops over the tomb on which the statesman lies. Mr. BLOMFIELD contributes a part elevation of new "United University Club House," which is Renaissance in style, the orders being carried through two storeys and the windows square-headed. An architectural and archæological problem is revived by Mr. J. J. STEVENSON's "Restoration of the Mausoleum of Halicarnassos." A description is written on the drawing, but at the height it is illegible. The lower part is square, but a truncated pyramid appears to pass through the upper storey and to serve as a base for the quadriga. Another drawing by the architect is likewise monumental, a structure in Largs Cemetery, Ayrshire. It is a tomb sheltered by a Classic screen which is graceful in design. "The King Edward VII. Sanatorium," by Mr. H. PERCY ADAMS, is shown on two drawings, the north front and the lodge. The building has a pleasing and cheerful exterior without anything that would be depressing to patients, who can easily imagine themselves to be guests in a Sussex mansion of a superior class. The new buildings by Mr. E. I'ANSON in Giltspur Street, for St. Bartholomew's Hospital, might at first sight be taken for modern city warehouses. Economy dictated their character, and they will no doubt serve all the important purposes for which they will be erected. "The Gladstone National Memorial," in the form of a library and residence, Hawarden, is a larger group of buildings than might be supposed to be necessary in a remote town. It will serve as an educational centre. Messrs. DOUGLAS & MINSHULL, the architects, have adopted Late Gothic as the style, the windows being of large size. The group is well adapted for its purpose, and is dignified and appropriate. "The Refuge Assurance Company, Manchester," has been enlarged from the plans of Mr. PAUL WATERHOUSE. The block is improved by the addition of a tower. The style of the original building has, of course, been respected.

Imperialism is no doubt a privilege, but if Colonial architects claim the right of admission to the Royal Academy another cause arises for the enlargement of the Architectural Room, or the erection of a new and special gallery. Messrs. SCOTT & HUDSON, of Durban, are represented by the new Town Hall and Municipal Offices in that city. It is of a Renaissance type, and would be adapted for any English town. It is remarkable that throughout the world some form or other of Classic is preferred for public buildings. As compensation South Africa can offer commissions to English architects. The church of St. Mary, Johannesburg, with its cloister and parish hall, of which Mr. G. H. FELLOWES PRYNNE is the architect, reveals that the conditions of building, especially in churches, correspond with those in England. It is a fine example of Gothic, with a resplendent reredos, a tall steeple and other characteristics of an advanced English building. Mr. R. G. KIRKBY, of Pietermaritzburg, has designs for an insurance office in Cape Town and for the new Law Courts. Neither is suggestive of Holland.

English churches are numerous. In his design for one at Epsom Mr. C. H. MILEHAM has adopted a treatment that recalls Norman work. Mr. FRANK FREEMAN'S selected design for "Holy Trinity Church, Failsworth," is picturesque in composition, and augurs well for the young architect's success. "A Chapel for the Community of the Resurrection at Mirfield, Yorkshire," stands on an inclined site, of which advantage is taken by Mr. A. H. SKIPWORTH. In the interior there is an interesting screen. The shafts have raised spiral mouldings as in foreign examples. "The Church of St. Simon, Plymouth," is without a tower, but it is sufficiently complete in itself. The tracery is arranged in a way that suggests monograms. Mr. HARBOTTLE REED is the architect. "The Tower and Spire of St. George's, Bickley," by Mr. ERNEST NEWTON, are without any novelty of design, and the lower part is concealed by a tree. The new church at Bournemouth, by Mr. G. G. SCOTT, is severe in style, and the tower has a simplicity and massiveness which would appear strange in a town where later Gothic is in favour.

This year public buildings, with the exception of libraries, are not numerous. The Library at Wakefield, by Messrs. BLOMFIELD & SPILLER, is a one-storeyed building, an arrangement possessing many advantages. It is simple in style, and the broad arch which surmounts the entrance suggests that information is available for all. Mr. F. E. P. EDWARDS shows a design for an extension of the Bradford Town Hall, which is in keeping with Messrs. LOCKWOOD & MAWSON'S building, erected when Gothic was the only approved style. Mr. E. W. TWINING'S project for a County Hall in London, which would be erected on a bridge over the Thames, is revived, although the site for a new building has been approved. The style adopted is Gothic of an attenuated type. But it is shown on a good drawing, and the novelty of the structure undoubtedly attracts attention. The elevation of Lancaster Town Hall to Dalton Square, by Mr. E. W. MOUNTFORD, presents a severe type of Renaissance. Mr. W. H. BRIERLEY'S "Council Chamber, Northallerton," is a stately interior—a Parliament-house on a small scale.

There are some important groups of residences and office buildings. Mr. T. G. DAVIDSON has had the courage to design bank premises for The Hague which are not in keeping with local buildings. The entrance to "Dunham Massie, Cheshire," of which Mr. COMPTON HALL is architect, is somewhat Gothic in style, and recalls the feudalism of the owner by the motto in large letters, "Ma Puissance." The drawing of "Hornton Court, Kensington," Mr. J. D. COLERIDGE architect, does not do justice to one of the most important of the transformation works of which Kensington is the scene. There are shops on the ground level, there is a balustraded terrace over them, and in the rear are numerous flats. The group is interesting from a municipal point of view, for although it suggests airiness as well as an open space, the loss to the owners of the ground cannot be excessive. If the enterprise should be financially successful there are many thoroughfares in London which could be treated in the same way. In "The New Buildings in Wardour Street," by Mr. F. L. PEARSON, the ground storey is advanced beyond the main building, and not only a balustrade but sculptured figures on it were proposed. We believe that interesting arrangement has been set aside, and the whole building is on one plane. The change allows of greater floor space, but an excellent design has been sacrificed. Mr. STATHAM'S "Proposed Offices, Catherine Street," shows the windows as slightly set back; the piers have therefore an expression of strength. The brickwork is in part chequered and the arrangement of the roof gives a picturesque sky-line. "The Staircase, Brook House, Park Lane," is well treated by Mr. ARNOLD MITCHELL. A large space was available, and is lighted from above. Colour has been employed in a way which emphasises the architectural features. Mr. BRADSHAW'S central tower of the Leysian Mission Buildings suggests one of the reasons for the success of the group, which is unlike all the others in its vicinity. "The Ladies' House, Seymour Place," by Mr. J. T. LEE, is an immense collection of residences, and apparently less costly in the architectural details than one of the Rowton Houses. But it suggests the social tendencies which must alter the character of many

Digitized by Google

streets, and not to their advantage. "The Norwich Union's Head Office," by Mr. G. J. SKIPPER, presents a fine interior, which is richly decorated with colour. Visits to such places are rarely agreeable, and it is wise to avoid suggesting that there was a close connection between them and sepulchres—an oversight of which there are several prominent examples. Taken as a whole, the collection offers many subjects of reflection to the student of architecture.

PAINTING AT THE ROYAL ACADEMY.

THERE are not many paintings in this year's exhibition at the Royal Academy which can be said to have a special interest for architects. Representations of buildings are few. There is an absence of subjects which might be considered as decorative. We are far from asserting that either class of work should be in the ascendant. But the absence of them indicates one of the characteristics of the exhibition. Where decorative work is employed there will be necessarily respect for rules of composition—it may be of the academic kind. This year, however, composition in the old sense of the word is not particularly respected. There is so much striving after originality in one form or another, as if novelty could insure sales, that the rooms on that account present a somewhat unusual appearance.

We think it right that those who have attempted architectural subjects should, primarily, have some recognition. The first example following the catalogue order is Mr. ALBERT GOODWIN'S *S. Giorgio, Venice.* He shows the old church and island as seen from a point near the Dogana. The artist usually makes clouds his auxiliaries. On this occasion he has been struck by the quietude of the scene, the afterglow, as if Venice were identified with repose. Mr. HAROLD SPEED shows the *Temple at Tivoli by Moonlight.* That beautiful ruin has been as often represented as any work of antiquity. In this case the full height of the rock on which it stands is not suggested. The temple becomes pathetic, and the part of the rock seen scintillates in splendour. Mr. FRITS THAULOW has selected an admirable subject in his *Entreé du Chateau Royal à Copenhague.* The palace is not an imposing structure, but it is well adapted for the weird treatment of which the painter is a master. The rather bizarre bridge and the gloomy water aid in the desired effect, and one of those discordant elements for which Mr. THAULOW has a weakness is found in the bright red roof of a neighbouring building. Mr. G. D. LESLIE'S *Deserted Mill* in a way corresponds with Mr. GOODWIN'S *Venice*, for if one is suffused with a grayish blue atmosphere, the Berkshire subject has a grayish green. Mr. GOODWIN does not repeat himself in his atmospheric effects. But Mr. LESLIE is beginning to see nature as if it were always illuminated in the same way. Mr. SEYMOUR-LUCAS is generally very accurate, yet he has placed Old St. Paul's at a greater distance from the churchyard than plans would confirm. The picture, it may be said, is a mere illustration of an event, without any of those suggestions of character which are found in most of his other paintings.

It is not often blue and other tiles are represented with the fidelity which we see in Bey OSMAN HAMDY'S *Jeune Emir à l'Etude.* Other accessories of the room, including ancient books and a wonderfully adorned candlestick, are given with admirable correctness. The young turbaned Turk reclines on a couch, and his attention appears concentrated on a volume before him. The painting has appeared in the Salon, and it suggests how, in spite of doctrinal and other difficulties, art cannot be entirely suppressed by the Ottoman. Mr. INNES FRIPP, in his *Dives and Lazarus*, introduces a grandiose interior. *The Ruins of the Amphitheatre, Pompeii*, have been represented by Mr. WYNNE APPERLEY in a manner which is creditable. Mr. F. H. WILLIAMS in his *Interior, National Gallery*, has had the courage to depict a building which is condemned without reason. He has made a really interesting painting of one of the recent halls. The most important, however, of all the architectural paintings is Mr. JOHN FULLEYLOVE'S *The Acropolis from the Pnyx, Athens.* It is of large size, and has been hung in a position in which it can be examined without any strain on the eyes. We cannot recall any English painting which does so much justice to one of the most memorable of subjects, and which happily for humanity possesses perennial interest. As private collectors might not consider the picture a popular or marketable one, it should have been acquired for the CHANTREY collection, which is deficient in architectural subjects. Among the 250 water-colours shown this year there are several architectural scenes. But, as we have said, there is an absence of them among the oil-paintings, and that circumstance will help to give a general notion of the exhibition. The subjects treated do not require elaborate backgrounds. Some of the incidents are supposed to have arisen in towns, but the surroundings are not of a kind which call for much attention. The picture which is likely to be most talked of, *The Ever-Open Door*, by Mr. SIGISMUND GOETZE, has an opening approached by steps which cannot be considered as in any way architecturesque.

It might easily be imagined that architecture would be utilised this year. For some of the pictures which are already condemned, and which therefore have something remarkable about them, are paintings of historical subjects, or it would be more correct to say costume pieces, in which the builder's art is generally supposed to be necessary. The painting which has already won notoriety, if not renown, is Mr. ABBEY'S *Columbus in the New World.* When seen for the first time from the end of the long gallery it may appear, especially as a ship is introduced, as a scene on board the discoverer's vessel, which has been decorated with bunting to celebrate the success of the voyage. The event, however, is on the land and the *Santa Maria* is very close to the shore. Flags are introduced in abundance, and they are not mere bands of two or three colours, as in modern times, but have armorial bearings. COLUMBUS wears his finest suit of armour, and is kneeling on the island, whilst the chaplains in rich chasubles are reciting prayers suitable for so momentous an occasion. Some of the bands, which might at a distance be taken as flags which had become twisted round the supporting cords, are found to be lines of flamingoes, that have been disturbed by the intruders and have taken flight to some safer spot. Behind COLUMBUS are officers, likewise kneeling. Between the vessel and the shore a boat is seen filled with Spaniards. Mr. ABBEY is an artist who likes to treat incidents which have become familiar, if not stale, from the numerous representations of them. The arrival of COLUMBUS is the subject of engravings as well as paintings. That could also be said of the Shakespearean scenes which Mr. ABBEY has produced. Nevertheless, no artist has hitherto had the courage to accept the logic of circumstances and to imagine what occurred, instead of accepting a studio arrangement. Conventional laws are here set aside. Yet who can say that Mr. ABBEY has not come nearer to reality than any of his predecessors? An English admiral would take possession of a South Sea Island in very prosaic fashion. But in the fifteenth century discoveries were rare, and the Spaniards would treat them as solemnities. That COLUMBUS should wear armour is not ridiculous. In NELSON'S day English sailors believed the French admirals wore, not only top boots, but spurs. The chaplains would easily, of course, improvise a religious ceremonial. Heraldry was then a symbolic language. That birds would be disturbed and that they should take to flight in the manner which Japanese artists represent is also within the range of possibility. What startles people is not the untruthfulness of the picture, but the hardihood with which ordinary notions of picture arrangement are set aside.

Digitized by Google

Art should be free, and Mr. ABBEY is to be congratulated not only on his courage and insight, but for the brilliant and novel arrangement of colour which he has produced. Mr. GEORGE GASCOYNE'S *Battle-Dawn* could become an historical painting by a change of title, for it represents a troup of mailed equestrians about to charge. They are seen under a strong sunlight.

An example of a pleasing historical picture in the front room is Mr. A. STEWART'S *A Royal Fugitive, 1746*. It attracts as much by the landscape as by the figures. The Pretender and a few men stand on the mountain-side, and in the valley below the English soldiers are supposed to be searching for the Pretender, who is represented in a characteristic manner supporting himself against a rock, while his companions accept all the anxiety of the occasion. There is no exaggeration in it. The figures are well drawn; the landscape might be a representation of a natural scene. But what is most admirable is that there is no attempt to make the Prince out as more than mortal. Is *The Linnean Society of London: Admission of Lady Fellows*, by Mr. SANT, to be taken as an historical picture? From the gravity of the men and women taking part in it it might be a most serious event for the whole world. Indeed, one expects when the wife of the secretary signs her name to hear cannon let off to announce the beginning of a new era. Mr. Gow's province is very narrow, and he does well to enlarge it. *Elijah* shows the prophet running before AHAB. The king stands on his chariot with the driver. The number of figures is therefore limited. For the chariot and trappings of the horses Assyrian sculpture affords materials. But where in the Bible is it mentioned that the head of the prophet was surrounded by a nimbus? No doubt it was considered that ELIJAH'S superiority could not be suggested in any other way. The nimbus was used in the East, and there are Roman examples. Nevertheless, there is no evidence that rays of light distinguished the prophets from ordinary mortals.

It is somewhat unusual that beside the *Elijah* there are two other Biblical scenes close to the entrance of the large gallery. Mr. H. R. RAINEY represents CAIN as exclaiming, "My punishment is greater than I can bear." It is a well-modelled figure, standing with one arm stretched out, as if to ward off further woes. Some years ago we published a South American artist's *Cain* who appeared to be desirous to enter within a rock against which he knelt in despair. We mention this as a proof of what varied interpretations can be given to simple words. Mr. TITCOMB'S *Benedicite*, a Madonna and Child with angels, is so unworldly and reverential it might well pass as a copy of a work by some early Italian. *The Heretic*, by Mr. FRANK CRAIG, can happily be considered as an historical picture, for if heresy were to be punished in our times the fires would never be extinguished. The artist has given remarkable attention to costume. Those who are desirous of considering how the same incident under similar conditions can appear to two artists would do well to compare Mr. CRAIG'S version with Professor GEETS'S *Martyr of the Sixteenth Century*, which is now in the Guildhall Gallery. It is satisfactory to know how well the English picture will sustain examination. A variety of emotions are expressed in a very subtle way, as, for example, in the monk who covers his mouth with his hand in order to conceal his sympathy; and the brilliancy of the colours would make the picture remarked in any collection. Mr. EDGAR BUNDY has found an excellent subject in his *Capture of James II. at Sheerness*, although there is no scope for his humour. The unlucky king was not much respected alive or dead; but there was no doubt he was to be pitied when he had to put up with the rough treatment of the mob. Mr. ERNEST BOARD'S *Departure of John and Sebastian Cabot from Bristol* will by some be accepted as the most successful of the historical pictures. As a pageant it is more effective than the American scene, for the notabilities of Bristol in the fine robes of the early sixteenth century are present. Works of that kind are almost enough to overcome the prejudice that has existed against the depicting of transactions of a former age. *Off to the Spanish Main*, by Mr. A. D. MCCORMICK, also contributes to keep up the interest in the early voyagers. Mr. W. E. G. SOLOMON'S *Ulysses recognised by the Nurse Euryclea* obtained the gold medal and travelling studentship in last December. It is a promising work, especially for the power seen in the head of the wanderer.

There were rumours abroad that the number of portraits this year was likely to be diminished. But they appear to be as numerous as ever. In the first room is *Earl Roberts*, by Mr. SARGENT. The subject is in full regimentals, displaying all his medals and decorations; the latter must have been a trial of the painter's patience, but they are rendered most effectively. The portrait of *Sir Felix Semon*, near it, by Mr. H. VON HERKOMER, is admirable as an expression of racial peculiarities. The same artist has been unusually successful in his portrait of *Mrs. Leopold Albu*. The President has shown his usual painstaking endeavour in the portrait of the Duchess of NORTHUMBERLAND. The *Sir Evelyn Wood*, by Mr. OULESS, is admirable both as a likeness and in the absence of all that restlessness which almost seems to be inherent in English military portraits. Here we have a soldier who appears to be directing operations in a calm assured way with his plan beside him. The picture of the four professors of the Johns Hopkins University, by Mr. SARGENT, was evidently a difficult work. It is impossible when looking at it to forget similar groups by REMBRANDT in which neither subject nor artist had any objection to an expression of geniality. The four American gentlemen, like EMERSON, appear to be afraid of an excess of fellowship, and we think of them as four intellects rather than as four men. They have in excess that self-consciousness which is the bane of English portraiture. The canvas has been enlarged, no doubt with a desire to produce a monumental work. But the great dreary space seems only to emphasise the chilliness of the group. While we recognise the skill of the portraitist, we pity the students who have to look on the painting every day. Mr. HARRIS BROWN has a vigorous portrait of the Provost of Trinity College, Dublin. He is occupied with a pair of large and old volumes, but the head is not a scholar's. There is no use in adding to the objections raised against the admission of the pair of Royal portraits for Ottawa, exhibited by command. That they could be produced in these days must excite our special wonder. Mr. SOLOMON has been successful with the portrait of *Sir Aston Webb*. *The Lord Bishop of Salisbury*, by Sir GEORGE REID, is not surpassed by any work of its class in the exhibition. Mr. MOUAT LOUDAN displays power and grace in his *Mrs. MacGeorge*, which is his most important work. Mr. GEORGE CLAUSEN is no longer proof against the general temptation, for his portrait of *Mr. Williams Benn, M.P.*, expresses nervous force and strenuousness in a vivid way. There is greater repose in his *Town Clerk of Lincoln*.

There are a few other pictures at which we can merely glance. Sir ALMA-TADEMA'S *Ask Me no More*—a Greek maiden and her lover seated on a marble bench overlooking the sea—is bright with sunshine. But dare we say that the figures have not the relief which was attained in former works by an almost sculpturesque modelling? Mr. WATERHOUSE could hardly find a more suitable pessimistic subject than *The Danaides*. Like so many of his heroines, the sisters are all of a silly type; but they are clad soberly, and the brazen vessels form an excellent contrast with the bluish stuffs and the pale faces. Somewhat akin to it, although of a very different class, is Mr. BRANGWYN'S *Venetian Funeral*, for it also recalls an old hanging. The picture suggests that in Venice, as in Ireland, grief is drowned in intoxicants, and the whole mob of men and women, old and young, have a muddled appearance. Nevertheless

Digitized by Google

such largeness of treatment is almost enough to excite envy and suggests practically unlimited opportunities in the future. But why should so able a painter always attempt to give the effect of mere weavers' work? Anything connected with death cannot be pleasant, and Mr. SIGISMUND GOETZE'S *The Ever-Open Door* has to meet a general prejudice which is excusable. It is supposed to consist of incongruous materials, but they are all closely related in sharing the common lot. It must also be allowed that all the constituents are excellently painted, and the general chromatic effect is satisfactory. Mr. WALTER LANGLEY has often painted pathetic scenes, but he has never been more pathetic than in his *Fisherman's Widow*—an old woman who seems to be pondering at the place where the wreck occurred. Lastly, we must mention Miss LUCY KEMP WELCH'S splendid group of horses, who are really expressive of *The Joy of Life*.

SCULPTURE AT THE ROYAL ACADEMY.

IT is gratifying to see so many statues this year which are self-expressive without the aid of accessories. By that power English sculptors have made a vast stride towards the great exemplars of the art, the ancient Greeks. A few instances will suggest our meaning. If we take a statue such as the *Dr. Creighton* by Mr. THORNYCROFT we recognise at once from the embroidered cope, the crozier and other details, that it must represent a bishop, although the mitre, which in heraldry and poetry is the principal characteristic of episcopal costume, is absent. The seated figure of *Sir Thomas Browne*, by Mr. PEGRAM, might be BURBAGE or other Elizabethan in the character of HAMLET, or a philosopher, and following out the line of thought it would perhaps be possible to arrive at the conclusion that the subject is the Norwich physician. The majority of English sculptors introduce at all times something which would be explanatory of their creation. When HIRAM POWER'S *Greek Slave* appeared in the Exhibition of 1851 it excited surprise from being the work of an American. Adverse critics, however, condemned it because the woman bore a chain. A Greek sculptor, it was said, would never have inflicted such an indignity on a beautiful woman. But if the chain were removed the figure would need another appellation, and perhaps it would be found that as the sculptor always thought of the figure as a slave there were subtle arrangements which would in a figure to which another title applied have no meaning. GIBSON'S *Venus* was the rival to the *Slave* and was a gracious goddess, but the sculptor could not trust to beauty alone to explain the pose and figure. Like a tyro he provided the deity with the apple which she was awarded by PARIS, the shepherd, in order to remove all doubts from spectators.

Sculptors who have been students at the Academy have reason to believe that a figure must be aided by something external. Did not REYNOLDS say:—"Take from APOLLO his lyre, from BACCHUS his thyrsus and vine leaves, and from MELEAGER the boar's head, and there will remain little or no difference in their characters"? He also refers to the circumstance that the old sculptors sometimes completed their statues and groups and then invited other artists to select titles for them. REYNOLDS was not an infallible authority, and we believe there are statues in the present exhibition which refute his conclusion. Look, for instance, at the *Eurydice*, by Mr. T. M. CROOK. She appears as if about to expire, although there is no symbol to express the weakness. If we compare the *Narcissus* by Mr. HAROLD PARKER with the *Narcissus* by Mr. A. J. LESLIE, we see two interpretations of the legend. In one the youth holds his hand to his head as if in surprise at the vision of his beauty, while in the other we see one who is almost bored by his own admiration. In his *Mercury, the Herald*, Mr. DAVID MCGILL has introduced the caduceus, and that is a concession to Academy tradition. But the figure would be equally expressive of the Olympian orator and messenger by its treatment and the pose. There are other instances which we could refer to as indications of a new spirit. But the reader will do well to seek them out. Several paintings are inspired by classical legends, and when they are selected it is well to endeavour to follow Greek work, which is characterised by the self-sufficiency of the human figure to express beings having certain qualities.

Realism may, however, be considered as omnipotent in the collection. What can be more suggestive of our times than the bust of *Bokane*, the pygmy from Central Africa, by Mr. GOSCOMBE JOHN? It has no doubt ethnological value, and another pygmy might consider it as a type of manly beauty. But its appearance in a gallery of sculpture is puzzling. The group by Mr. REYNOLDS-STEPHENS of Queen ELIZABETH and PHILIP of Spain playing *A Royal Game* with ships for pawns is an innovation; but sculpture cannot be restricted to one variety of production. It is sure to be popular, like *The Pixies' Ring*, by Miss MARYON, *The Whisper*, by Mr. T. TYRRELL, and *The Intruder*, by Miss POWNALL. Sir C. B. LAWES-WITTEWRONGE some years ago produced a very large group which was expressive of the MAZEPPA theme. This year he has a companion group of DIRCE. She was the wicked wife of LYCOS, and had ordered that ANTIOPE should be dragged to death by a bull. The executioners discovered that ANTIOPE was their mother, and seized DIRCE and bound her instead. It is a scene of extraordinary commotion which requires unusual skill, and there is no lack of vigour in any part of the group, which stands in the middle of the central hall.

Mr. BROCK indicates the character of the sculpture in the Victoria National Memorial by one of the panels for the fountain. The sweep of the contours of the water nymph on so large a scale is remarkable. Different in character and more enjoyable is his statue of *Gainsborough*, which is intended to be placed in the Millbank Gallery. The style of the statue is as much in keeping with that of the painter as is possible in marble. Like GAINSBOROUGH'S portraits, it seems to have been wrought for the pleasure of the work. The figure is well modelled, and the apparent concentration of gaze on a supposed model or subject is masterly. Mr. GOSCOMBE JOHN'S *Principal Viriamu Jones* is a seated figure and indicates the possession of that self-satisfaction which is considered to be a desirable quality in heads of colleges. Sir WILLIAM RICHMOND'S *Model for Memorial to Mr. and Mrs. Gladstone* is undoubtedly a difficult work, and it is impossible to obtain a view in the lecture hall which would suggest its position in Hawarden Church. As we see it, it is somewhat suggestive of an ordinary siesta, for the figure of the angel with protecting wings and the construction of the structure below are not unsuitable for a costly bedstead. In Chichester Cathedral there is a well-known tomb of Lord and Lady ARUNDEL. It is not a great work of art, but it is impossible to look at it without feeling the pathos of the situation. The noble was beheaded; we feel the wife still believes in his innocence, and that her faith was stronger than death. The GLADSTONE memorial has only the pathos which can belong to lifeless forms. Apparently to compensate for what the deceased do not reveal an oxidised figure of the Crucified has been placed on the bodies. We suppose it may be taken as evidence of faith, but it looks as a supplementary appendage which was only temporarily placed in that position. There can be no question about the pains taken with the memorial, and the likenesses of the two figures cannot be disputed. But it is a product of artistic logic rather than of artistic inspiration.

Mr. GILBERT is only represented by a bust, *Francis Petrus Paulus, pictor*, which is very curious, and a small sketch model of St. GEORGE and the Dragon, which should be enough to tempt a millionaire

Digitized by Google

to have it reproduced in precious metals, and thus bring a renown which would outweigh the expenditure. The busts and medallions are numerous, and it is satisfactory to observe that metalwork is gaining some recognition. It will be found that the advance of sculptors continues, and in a few years we may expect that the general collection will bear comparison with what is to be seen in a French Salon.

THE LATE THOMAS GARNER.

THE sad and unexpected death of Mr. Thomas Garner, which took place on the last day of April at his beautiful old house, Fritwell Manor, in Oxfordshire, has brought to a close the career of a distinguished architect whose unfailing industry, conspicuous talent and single-minded devotion to his art merit something more than the passing notice which they have so far received.

Born in 1839 at Wasperton Hill in Warwickshire, and reared amidst the old-fashioned and simple surroundings of a remote rural district, Thomas Garner imbibed the natural hearty country instincts which became a part of his nature and were never blunted or diminished during many years of residence in London, and before the long hoped-for return to the country was realised by his establishment in the fine Jacobean manor-house at Fritwell. To his country education he owed the love of riding and the excellent horsemanship which he retained to the last.

Mr. Garner was articled to Sir Gilbert Scott at the early age of seventeen, and served, with the energy and enthusiasm that never left him, as one of the many pupils of that gentleman. Among his contemporaries in Sir Gilbert's office, many have risen to distinction; we may instance Mr. T. G. Jackson, R.A.; Mr. Micklethwaite, architect in charge of Westminster Abbey; and Mr. Somers Clark, who has the care of St. Paul's Cathedral. Mr. G. F. Bodley, R.A., whose partner he was destined to become, just preceded him at Scott's office, but a warm friendship was soon established between the senior and junior. On the completion of his articles Mr. Garner returned to Warwickshire, and was responsible in his first few years of practice for various works on his own account, or as representative of Sir Gilbert Scott. Mr. Garner went back to London about the year 1868 to assist his friend Mr. Bodley, who was rapidly coming into note, and who found himself somewhat overburdened with work. The assistance soon grew into the partnership which was to last for over twenty-five years, and which ceased by the friendly dissolution of a friendly bond about the year 1897. For a time the collaboration of the partners was actual and close, but as work increased upon their hands it became their habit to individualise, each partner assuming the entire and separate responsibility for definite work. The earlier period of close collaboration produced some remarkably successful results, none perhaps more notable than the fine churches of the Holy Angels at Hoar Cross, Staffordshire, and of St. Augustine at Pendlebury, near Manchester. The succeeding period of dual practice under partnership allotted most of the civil or domestic work entrusted to the firm to the almost undivided initiation and control of the junior partner, while his senior devoted himself more especially to ecclesiastical work and to decoration. Mr. Garner was almost entirely responsible for the design and supervision of much of the firm's work at Oxford, such as St. Swithun's Quadrangle at Magdalen and the tower at Christ Church, and entirely so for the President's lodgings at Magdalen. He designed, while his partner was busy with other work, Hewell Grange, Lord Windsor's Worcestershire mansion, with all its elaborate and costly details, the well-known reredos in St. Paul's Cathedral and several sepulchral monuments, such as those of the Bishops of Ely, Lincoln and Chichester, and that of Canon Liddon.

Of his work subsequent to the dissolution of partnership it is sufficient to mention Yarnton Manor, Oxon; the Slipper Chapel at Houghton-le-Dale; Moreton House, Hampstead; the Empire Hotel at Buxton, and the crowning work of his arduous life, the beautiful chancel of Downside Abbey, near Bath, beneath whose roof his body now reposes. Mr. Garner was of a shy and modest disposition, and less known to his contemporaries than his most unusual abilities, scholarship and attainments would have allowed a less retiring character to remain. As an instance, however, of contemporary estimation, we may state, upon the best possible authority, that when Mr. Bentley, stricken by the fatal paralytic stroke, was asked by Cardinal Vaughan what architect he would choose to carry on his work in Westminster Cathedral, he answered "Garner, for he is a man of genius."

Thomas Garner was an admirable and rapid draughtsman and an untiring student. He will long be remembered by his friends for his warm heart, his ardent enthusiasm, his minute and scholarly knowledge and his unceasing energy. His long-projected book upon old English manor-houses will, we believe, appear in accordance with the notices already issued by Mr. B. T. Batsford.

NEW EFFECTS IN POTTERY.

THE association of Lambeth with potteries dates from the seventeenth century, when some Dutch settlers took up their quarters there. Within a hundred years Holland instead of being the merchant for such articles was the customer of England. The settlers introduced into Lambeth the manufacture of salt-glazed stoneware. It had been known in England from about 1550 in the form of jars and flagons. The earliest artistic effort of the Doulton firm in this ware was on the same lines, and resulted in the familiar "Toby jug." The next step was the production in 1855, under the late Sir Henry Doulton, of terra-cotta garden vases in red and buff clay, which was shortly followed by the application of incised decoration to small articles, on the suggestion of Mr. George Tinworth. The firm exhibited their artistic efforts in 1867. But their "Art Pottery" is considered to date from 1870. In the South Kensington exhibition of 1871 they created something of a sensation, and Queen Victoria purchased half the contents of a large case of "Doulton ware." Their display of art pottery at Vienna two years later marked a still greater advance. In 1877 works were opened at Burslem, Staffordshire, where practically every known variety of china and porcelain and artistic earthenware has been produced. Other works have been established in various parts of the country and in Paris.

During the month of May an exhibition will be held at the New Dudley Gallery, Piccadilly, of "New Effects in Pottery, and works by George Tinworth," being the work of Messrs. Doulton's artists at Lambeth and Burslem. There is a wide difference between the work of the two places. At Lambeth it is on a stoneware basis, while the earthenware and china of Burslem reveal the beauties of flambé and crystalline glazes. The use of a brown body at Lambeth results in low-colour tones, almost sombre when compared with those possible in Staffordshire, where the body is white.

The classification of Chinese porcelain begins with the Sung dynasty, which ruled from A.D. 960 to 1280. The productions of the Primitive period were generally covered with glazes of single colours, either of uniform or mottled tints, and surfaces were both plain and cracked. The pale grey-blue and deep purple Chun-chou wares were remarkable for the brilliance of their *yao-pien*, or "transmutation" mottled tints, due to the varied degree of oxidation of the copper silicates in the glaze. The emulation of these transmutation flambés has been the seemingly unattainable goal of successive generations of potters. The Burslem artists were in their turn fascinated by the problem, and met with most satisfactory success. Their rouge flambé examples at the Dudley Gallery might challenge comparison with the ancient Chinese achievements. Nos. 1, 25 and 223 are on the largest scale and of the most striking character. The first is a round-shaped vase, with wooden stand and cover. On it is a scene, "The Sphinx." The second is intended for use as a flower-pot, and illustrates "The Moors." No. 223 is a large bowl and standard, without any decoration. In shape it suggests a half-closed lotus. Rouge flambé ware is not confined to vases or pots; it includes figures of chicks, rabbits and plaques. Totally different is the effect of the crystalline pieces, which are as modern in principle as the others are ancient. No. 69 is catalogued as imperfect, and suggests the difficulty of all pottery work. In the firing a small crack has appeared underneath the base. One of the fascinations of pottery is the element of chance which attends the process. It is impossible to foretell exactly what will be the effects of the kiln. Two pieces side by side, although identical in every way before baking, may afterwards show great surface difference. This same fact is, of course, likewise a disadvantage, because for inexplicable and unpreventable reasons a piece on which much labour and time have been expended must often be thrown

Digitized by Google

away on account of flaws. Messrs. Doulton could never guarantee to provide an exact replica of any of their exhibits.

The peculiarity of stoneware is that it is only once fired. The decoration is done immediately the object leaves the potter's wheel. Large open kilns are used for the firing. The salt glaze is obtained by throwing common rock salt into them from the top. Mr. John C. L. Sparkes, headmaster of the Lambeth School of Art, organised the "Art Department" of Messrs. Doulton in 1872. The present exhibition reveals the high degree of excellence to which they have attained. There are over two hundred objects in salt-glaze stoneware, and every one of them has been obviously touched by the hand of an artist. An extraordinary variety of glaze, surface and shape is revealed. The decoration is applied in numerous ways. Vase No. 196 suggests the starting-point of this elaborate pottery collection. It is a plain straightforward ware, without any glazing, and of a light brown and white colour. In contrast to it is the large vase No. 257, which shows a dragon crawling up to the top. It is difficult to believe how closely allied all these objects of beauty are to the useful but unornamental drain-pipes, of which they are really the direct developments.

Some visitors may perhaps discover most interest in the terra-cotta panels by Mr. George Tinworth. The largest is 10 feet by 4 feet, and shows the Greek mother giving the shield to her son, with the words, "Either bring this shield back or be brought upon it." Mr. Tinworth rarely looks outside the Scriptures for his inspiration. Indeed, so imbued is he with that source that even in the present Classical subject he has in three places introduced Scripture references. The principal figures are in full relief. Behind are tall trees giving perpendicular divisions. The background shows marching soldiers. The Spartan youth receives the stern parting words of his mother at a moment when about to drive off to the war. There are numerous figures in the carefully arranged panel, and they are all pleasant to look at. Three other smaller panels by Mr. Tinworth are shown. It is evident he has followed the course of architecture, and his work is now as well adapted to Renaissance buildings as it was formerly to Gothic churches.

The Royal Doulton Potteries are a national industry, and the display at the New Dudley Gallery is well fitted to justify their fame. The 500 objects are all worth careful scrutiny. They will be found to bear comparison with any examples of continental workmanship.

SURVEYORS' INSTITUTION.

A PAPER was read by Mr. Cyril H. Donne at the junior meeting of the Surveyors' Institution on Monday, May 7, upon the "Fiscal Burdens on the Land and Taxation of Site Values." A large number attended. The students from the Law Students' Debating Society were invited to attend, and the Society was well represented. The paper was followed by a keen discussion, in which both the law students and the Institute members took part. The reader of the paper replied, and the chairman of the evening (Mr. J. H. Sabin) addressed the meeting. At the conclusion of the evening a special vote of thanks and of appreciation of his services was accorded to Mr. Sydney A. Smith, the retiring hon. sec. Mr. C. H. Dinwiddy was at the annual general meeting, held prior to the ordinary meeting, appointed to succeed Mr. Sydney A. Smith as hon. sec. The dinner will be held on May 16.

FURTHER STRAND IMPROVEMENT.

THE deputation from the Further Strand Improvement committee appointed by the meeting held at the Royal Academy on March 19 was received at Spring Gardens on last Wednesday by the improvements committee of the London County Council.

The deputation consisted of Sir Edward J. Poynter, Bart., P.R.A., president; Lord Claud Hamilton, Sir William Chance, Bart., Sir Thomas Hewitt, K.C., Sir Henry W. Lawrence, Bart., Mr. Reginald Blomfield, A.R.A., Mr. Howard Chatfeild Clarke, representing the Surveyors' Institution; Rev. H. V. Le Bas (Charterhouse), Mr. Ernest Noel (chairman of the Artisans' Dwellings Company), Mr. Hamo Thornycroft, R.A., and Mr. Mark H. Judge, honorary secretary.

Sir Edward J. Poynter handed in the memorial with the plan advocated, and said that Mr. Reginald Blomfield, A.R.A., would speak in support thereof.

Mr. Blomfield, in the course of his address, said:—Mr. Chairman and gentlemen,—I have been requested to lay before you the views of this deputation in regard to the Further Strand Improvement, and though much of what I have to say will be familiar, I think it desirable to recapitulate as briefly as possible what has already happened in regard to this difficult question.

The architectural defects in the scheme as at present settled by the London County Council will be obvious to anyone who stands on the north side of the Strand between St. Mary-le-Strand and St. Clement Danes and looks east and west. (1) By the dip southward the vista is arrested by St. Clement Danes, and the church itself, with the new buildings, is made to block the view of the Law Courts, one of the great public buildings of London, a building, whatever may be thought of its style, of singular picturesqueness, and one which most happily marks the transition from the regular buildings which will presumably occupy the vacant site, to the haphazard jumble of buildings in Fleet Street. (2) The general axis line of the London County Council scheme is not parallel to the axis line of St. Mary-le-Strand, or, so far as can be seen, to anything at all. The result of this is that St. Mary-le-Strand is left out of relation to the general scheme. As, moreover, the frontage line leaves more than half of St. Clement Danes out of account, these two churches will not be brought into touch, and the position of the Gladstone monument will emphasise the absence of any consecutive idea. That fine piece of work will seem to be thrust aside to one corner, surely not the intention of the London County Council when they assigned it the commanding position it now occupies. (3) Looking westward, from a point between St. Clement Danes and the Law Courts, the vista of the Strand to the west of St. Mary-le-Strand will be entirely cut off. At present the top of the Nelson column is clearly visible. The whole of this will be blocked by the buildings shown in the London County Council proposals, because, owing to the eastward dip of their alignment, the spectator will be driven so far south that St. Mary-le-Strand will be made to intercept the view.

Generally, the London County Council proposals appear to us not to have grasped the full possibilities of the case. They limit themselves to the ground between Wellington Street and St. Clement Danes, whereas they should take into consideration the whole space from Wellington Street to the eastern end of the Law Courts. If this is done, a superb architectural vista is assured. The Law Courts are brought into relation with the important new buildings which will occupy the ground to the west. The churches of St. Mary-le-Strand and St. Clement Danes will fall into their places as architectural monuments of great beauty and interest, standing clear in what may be made one of the finest roadways in the world; and thus, at a relatively small cost, London gain architecturally the unearned increment of the money spent in the past upon all these excellent buildings. The scheme advocated by the Further Strand Improvement committee will provide those advantages—advantages which seem to us far to outweigh the estimated financial gain of the London County Council scheme; and we earnestly appeal to you to reconsider the whole matter before coming to an irrevocable, and, in our opinion, a disastrous decision.

After some discussion the chairman of the improvements committee (Mr. Hubbard) said that the Council were with the deputation in the desire to see London made more beautiful, and he assured the deputation that the views they had expressed would receive the earnest consideration of his committee. Sir Edward Poynter thanked the committee for receiving the deputation and for the attention given to their remarks, and the deputation then withdrew.

At a Special Meeting of Shrewsbury Town Council it was reported that the statutory poll of the ratepayers to enable the Town Council to proceed with the Bill in Parliament to carry out an upland water supply at a cost of 183,000*l.* had resulted in the scheme being rejected, the figures being as follows:—Against the scheme, 1,918, for the scheme 1,365; majority against 553. The water committee also reported that the owner of land adjoining the conduit head, which supplies the town with drinking water, had commenced sinking a shaft for coal, and that there was a possibility of the springs being tapped and the supply of water exhausted. In case of this happening arrangements had been made for the town to obtain water from a private supply.

NOTES AND COMMENTS.

For many students of art the exhibition which will be opened to-morrow in the new buildings of the Bibliothèque Nationale will be more interesting than any of the three Salons with their modern works. The Bibliothèque possesses a collection of miniatures, drawings and engravings of the utmost value, and an exhibition of a selection from them will inaugurate the galleries which M. Pascal has created. The authorities have not been satisfied with their own collections. They had recourse to amateurs who have lent invaluable examples of miniatures and other works. The period selected extends from the time of Louis XIV. to the end of the eighteenth century. The art will be mainly of a personal or domestic kind, for the drawings and engravings may have at one time been hung in private apartments or placed in small cabinets. English work will not be ignored, for Frenchmen were able to appreciate the fine engravings after Reynolds and Gainsborough produced in the eighteenth century. Some other products of that century will also be utilised, and there can be no question of the fascination of the exhibition which can be enjoyed from next week.

Local authorities cannot be expected to have any intimate knowledge of the difficulties to be met in carrying out a building contract, and when a claim is made for extras they commonly jump to the conclusion that it is unjust. To avoid trouble to themselves they immediately decide on legal proceedings in some form. What that means to those who have to pay the costs has been exemplified in Ireland. The committee of management of an asylum in Portrane applied to the Local Government Board for authority to raise 2,000*l.* in order to pay the costs of an arbitration. The builders (Messrs. Collen) claimed 10,108*l.* as the balance due to them, and after an exhaustive investigation Sir Thomas Drew, the arbitrator, awarded them the whole sum. In other words, the account was correct and should have been settled promptly. According to the statement presented to the engineering inspector of the Local Government Board on Monday, the arbitrator's fees amounted to 158*l.* 0*s.* 6*d.*; quantity surveyor's fees, 187*l.* 8*s.* 6*d.*; law costs, 421*l.* 9*s.*; architect's fees, 404*l.* 6*s.* 4*d.*; expenses in connection with the arbitration, 258*l.* 7*s.* 6*d.*; Messrs. Patterson & Kempster's fees, 317*l.* 13*s.* 10*d.*; expenses of preparing evidence, &c., 395*l.* 12*s.* 2*d.*; Mr. Mitchell's fees, 200*l.* There are other fees of smaller amount. We suppose the local authorities are now convinced the builders were honest, but the ratepayers will have to pay a heavy sum for the logical process adopted.

Among the numerous French officials who applied themselves to the literature of the arts one of the most distinguished was Emile Molinier, who died in Paris this week in his forty-ninth year. He contributed largely to *L'Art*, and was one of the writers who co-operated in the excellent series of "Les Artistes Célèbres." He was one of the conservators of the Louvre, and was accepted as an undoubted authority on the history of furniture, as well as of Mediæval art. In 1900 he was entrusted with organising the retrospective exhibition of French art in connection with the International Exposition, and he succeeded beyond all anticipation. Reviews of several of his works have appeared in *The Architect*.

The French Government are about to send a party of explorers, under the direction of M. Pelliot, in order to report upon the northern regions of Thibet. Remains are known to exist of numerous ancient cities in that region as well as monuments, all of which would have interest for archæologists. It is expected that much that is now buried in the sand can be exhumed, and a new light may be thrown upon the history of the kingdom. In the seventh century Thibet was so prosperous it was said the king built his palace with cement moistened with the milk of the cow and the yak. There is one guarantee of success in the encouragement offered by the Chinese Mission now in France. Thibet has been for a long period under the sway of China, and recent events may have convinced the people it is better to depend on China than on any European nation. Students of geology, botany and other sciences have visited Thibet, but archæologists have hitherto imagined that it could not offer anything which is worth their attention. The Pelliot Mission may afford revelations.

COUNCIL SCHOOL FOR THE BOROUGH OF BEXHILL-ON-SEA.

Bexhill-on-Sea has advanced more quickly in public favour than the majority of watering-places. But it is incumbent on those who are associated with it as authorities to remember that the interest of a town does not alone depend on the provision which is made for visitors or temporary residents. Kursaal, bandstands and shelters are regarded with suspicion if it is found that other buildings are of an inferior character. It was wise to have selected the picturesque design for a school building which Mr. Burke Downing has prepared, for if carried out as shown in the illustration it would give visitors a satisfactory idea of the arrangements of the town. A simple and dreary school would suggest that the young townsfolk had to suffer while the young strangers were able to enjoy themselves. If through any false notion of economy the design were altered, there can be no question that the town would suffer. A good design may be considered as an organic thing and cannot be mangled without becoming displeasing to the eye.

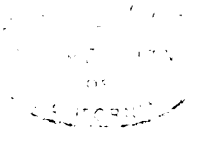
RIPON POST OFFICE.

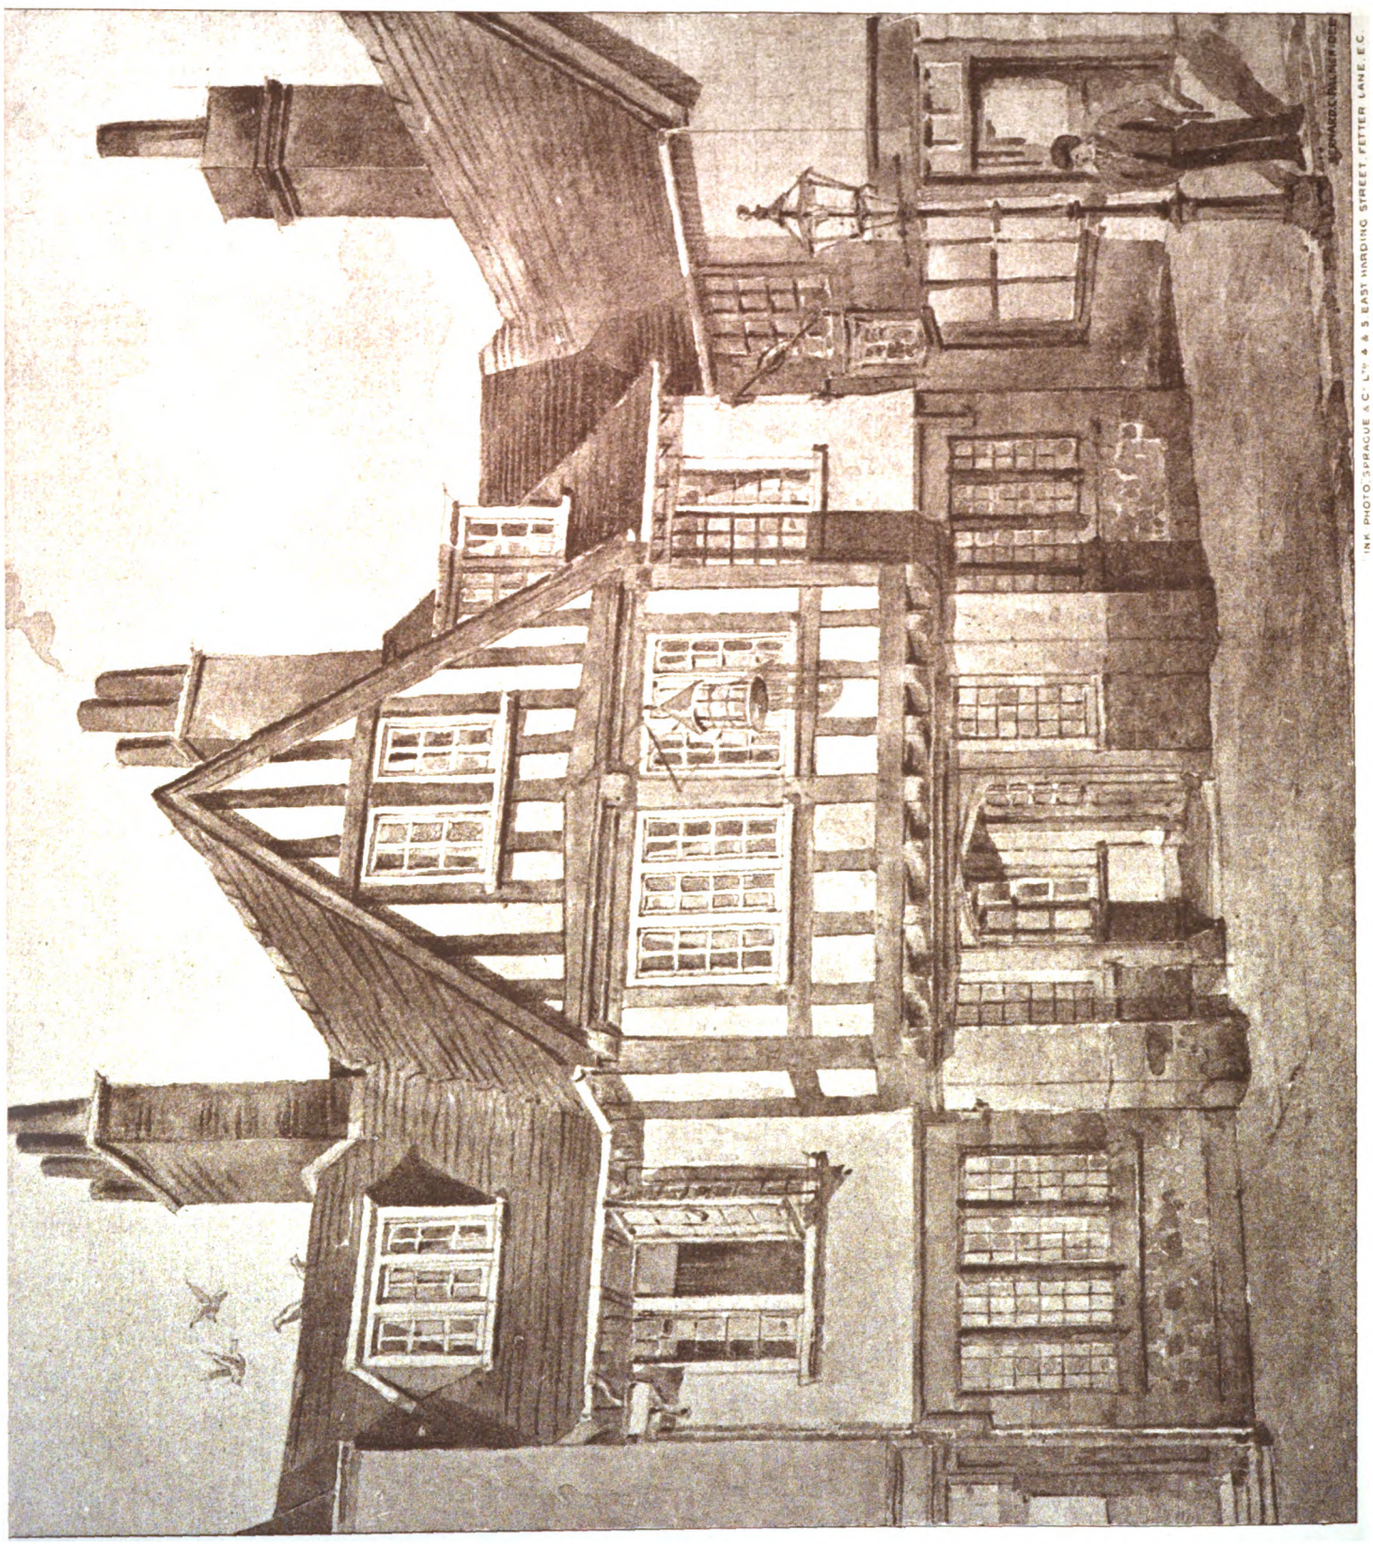
The Post Office authorities, finding that the old premises were inadequate and inconvenient for a modern post office, the site in North Street—a busy thoroughfare between the railway station and the market-place — was acquired by Mr. M. Slack, of Durham City, who agreed to build and lease the new offices to the postal authorities, having demolished the dilapidated buildings.

The public office—where general business is transacted—is directly entered from the street. Behind it is the sorting office, with an open timber roof, glazed almost halfway down the eaves from the apex; the floor is of wood block and noiseless. The postmen's cloak-room and stock store are entered from a lobby at the far end of the sorting office.



The mail and staff entrance is to the left of the public entrance. The first floor contains the telephones and telegraphic instrument-rooms; a messenger-room adjoins the last. The postmaster's private office and staff retiring-rooms are approached from the same landing as the instrument-rooms. The third floor provides accommodation for the district engineer and his clerical staff.

The heating is partly by hot water and radiators, assisted by open fireplaces. The ventilation consists of fresh-air inlets, and exhausts opening in the staircase hall with an extractor upon the roof. The sorting office has a separate extractor, assisted by ventilating windows.



The lowest storey is built in Knaresborough stone from the Queensland quarry, the middle of thin coursed brickwork; the attic storey is within a Mansard roof covered with Buttermere slates, and having an overhanging cornice at the eaves.

The architect is Mr. John G. Burrell, Market Place Chambers, Durham, who has built many post offices. The principal contractors are Messrs. Barker Brothers, Hampsthwaite.

FENESTRATION.*

(Concluded from last week.)

BEFORE we proceed to follow the treatment of windows in the great period of the English Renaissance it will help us to glance for a moment at the architecture of the country in which this great revolution was proceeding. Throughout Italy, during the fifteenth century, vast palaces were being built by a people full of character and embued with a love for the fine arts based on the rich inheritance of Imperial Rome, each city or state developing an individual style which reflected the life of the people. It is quite impossible here to enter fully into the various differences of these famous buildings, and two examples must suffice to illustrate our subject.

The palaces at Florence are distinguished by their bold, massive character and the extreme plainness of the lower storey. Taking, as an instance, the Ricardi Palace (1430), we find that up to a height of 11 metres from the ground there are, excepting the doorways, only very small rectangular barred openings, and the real window treatment does not begin till the first floor. The desire for protection is obvious in this arrangement, and the architect (Michelozzo) seized the opportunity of contrasting a massive rusticated lower stage with a double row of delicate and refined windows above. The design of these semicircular-headed windows, divided by slender shafts under a single arch, retains many details of the Mediæval Tuscan style, and helps to link the chain of tradition with Rome. The proportion of window opening to wall-surface is interesting and works out at about one of window to thirteen of wall, and gives a remarkable sense of solidity. The Strozzi Palace, where the design is very similar, gives a proportion of one in twenty-one.

These examples may be compared with the Vendramini Palace at Venice, built by Lombardo in 1481, fifty years after the Ricardi Palace of Florence. Here the difference in the general treatment is particularly marked in the number and arrangement of the windows. Individually the double lights beneath a single semicircular arch are much the same in character, but instead of being isolated openings pierced in the great mass of stone, they are connected throughout the front by pillars and pilasters and a wealth of ornament which gives an impression of lightness and grace entirely absent from the stern, forbidding façades of the Early Florentine builders. The proportion here of window to wall is one to three.

These two instances will be sufficient for the purpose of illustrating the effect of local conditions on fenestration. The Florentine palaces were built in narrow streets, and liable to sudden attacks, hence the protective lower storey and the principal rooms on the first floor. They were also built, as a rule, round a spacious courtyard, from which a great deal of light was obtained, so it was unnecessary to have a multiplication of windows towards the streets. Again, they were built on a solid foundation of rock.

The Venetian palaces were built facing waterways, and unexpected attacks were improbable. Thus we rarely find that absence of windows on the lower storey, and the general plan did not, as a rule, include a central court. The principal windows faced the canals, and, as the foundation was a matter of great difficulty and expense, the spreading out of the plan (except in the very largest buildings) was avoided, and the great proportion of opening to solid wall diminished the weight, and was a very important and determining factor in the design of the fenestration. In Florence the whole family, including married sons and daughters, lived in the palaces, which in those turbulent times at the end of the fifteenth century were practically fortresses, and the civic life of a free and factious Republic is represented by the heavy walls and narrow windows of Florentine dwelling-places; while a more sumptuous and secure mode of life finds expression in the graceful buildings, with their many-balconied windows, which overhang the Grand Canal of Venice, exactly fitted to an oligarchy sure of its own authority and loved of its people, and representing the centre of European commerce.

The introduction into England not only of a foreign style, but of foreign workmen, has been so well described by Mr. Blomfield and Mr. Gotch and other writers on the Renaissance that it is quite unnecessary to enter into it here, and every student of architectural history is familiar with the wonderful revolution in design which is inseparably connected with the name of Inigo Jones.

The Banqueting-House in Whitehall, finished in 1622, marks the beginning of a new era in English architecture. As has been pointed out, one of the characteristics of the great Tudor buildings was a long and low proportion produced by strongly-marked horizontal lines of windows with no studied architectural effect. But in the fragment of the palace in Whitehall we are face to face with a great and successful attempt to create a building full of the subtle proportions and use of purely architectural forms which Inigo Jones had studied in Italy under the influence of the great architects of the Renaissance. The window treatment is of exceptional interest. The proportion of voids and solids is well balanced, and works out at about one to three and three-quarters—that is to say, only slightly less window space than in the Vendramini Palace at Venice. But the façade of the Banqueting-House gives a far greater sense of dignity and strength on account of the plainer treatment of the wall surfaces between the windows, only broken by the columns and pilasters without the panelling and more restless ornament of the Venetian example. The proportions of the windows themselves work out at rather under two squares in height, which is somewhat wider than is usual in most of the Italian square-headed lights, which are generally about twice as high as the width—for example, the Palazzo Zecca at Venice, the Palazzo Uggioni at Florence and the Palazzo and Villa Farnese at Rome, to which latter building it bears some resemblance. The fenestration has been criticised as giving an effect of two storeys to a building which in reality was one lofty room. But the Banqueting-Hall was only a part of an immense scheme in which, if it had been completed, this fragment would have balanced another wing of the same proportion, but containing two floors of State apartments. The great difficulty of adapting this new architecture to the requirements of the day was felt from the first. A style of building which depended for its effect on well-judged proportion and a systematic arrangement of windows presented immense difficulties to the architects of the Late Tudor buildings, whose art was, to all intents and purposes, unconscious and in no way scientific. But architecture had suddenly become a science as well as an art—a science of proportion, and a knowledge of the great buildings in Italy was essential for those who embarked on the new undertaking. The older English tradition of planning survived for a much longer period, but the attempt to combine it with the hard-and-fast rules of Classical architecture eventually produced the main features of the Italian house plan.

In most of the great domestic buildings in England of the Tudor period the essentially English characteristic was the plan, and following as a natural result with an indigenous style, the internal arrangements found an expression on the outside—in short, the buildings were designed from the inside to the outside. But with this new and wonderful architecture borrowed from a distant country, this was reversed, and too often everything was sacrificed to the proportion and treatment of the façade. Thus we find English country houses following in all respects the villas and palaces of Italy, buildings designed by Italians for Italy, which were in many ways quite unsuitable for our northern climate.

One of the most thoughtful and capable of the French architects of the Early Renaissance has left behind him in his writings a strong protest against the indiscriminate use of the Italian forms in the buildings of his time. Philibert de l'Orme, in his book on Architecture, published in Paris in 1567, gives advice to his readers which is more than ever applicable at the present day. He says:—"The ornaments and decorations of façades should be appropriate and correspond with the interior of the building; the divisions of halls and rooms and the openings of windows and casements should not produce a repulsive effect on the exterior of the building." By this I understand him to mean that, though the building should be designed from the inside, it is necessary to have a very distinct and well-balanced scheme for the exterior. "Truly," he continues, "it is far more honourable and useful to know how to plan a habitation well, and render it healthy, than how to cover it with embellishments without reason." Although it is open to question whether De l'Orme really grasped the true spirit of Classical architecture, as Mr. Blomfield says in his essay on this architect, the feelings which prompted the above extract from his writings were those of a man with the courage of his opinions in the face of the vast change in ideas with which, perhaps unconsciously, he was not altogether in sympathy. These defects are chiefly noticeable in the more ambitious buildings of the eighteenth century,

* A paper by Mr. Walter Cave, read before the Architectural Association on April 27.

Digitized by Google

but in the more modest domestic work we find evidence of the growth of a distinctly English adaptation of the Renaissance, and the window treatment of the quiet red-brick fronts, which are to be found almost everywhere, is altogether satisfactory in its proportion and its sense of fitness for the purpose.

The effect of this revolution in architecture on the fenestration of our English buildings was very marked; for a long time the mullion and transom was still used and with good effect—for instance, at the Ashmolean at Oxford and Wolseley Palace at Winchester. But the sash-window, divided by the heavy bars, became the accepted type to the purist, and the difficulties of the adaptation of the Roman architecture produced much defective lighting of interiors. Such defects as the inevitably dark windows under the vast porticoes at Prior Park, near Bath, and Amesbury Abbey, Wiltshire, were inseparable from the use of a huge order, magnificent though the effect might be from the outside. The use of a colossal order running up the entire height of a façade would be dignified enough in itself if there was only one lofty room inside the full height of the building, but when there are several floors to be lit either the windows become out of proportion with the order, or if the windows are treated on the same colossal scale they must be cut up by the floors which cross them, producing anything but a pleasing effect from the inside and outside. This is the inevitable result of the neglect of true principles, and the adoption, without knowledge, of a style of architecture out of harmony with practical requirement. And in the Mansion House, and, later still, the Royal Institution in Albemarle Street (already referred to) show the difficulties of these ambitious attempts. The use of blank windows to produce symmetry in a design cannot well be defended, though adopted in many fine architectural compositions. Again, with a regular range of windows in small houses, it is inevitable that, without the greatest skill in planning, some rooms must be too dark and some too light.

To return to a more detailed account of the window treatment of the seventeenth and eighteenth centuries, I propose to take two typical and familiar buildings as representing the leading tendencies of these times, and to give a short analysis of their fenestration. After the Banqueting-House in Whitehall, which clearly marks the introduction of an entirely new element in design (in 1622), I propose next to take the east, or garden, front of Hampton Court, begun by Wren in 1689. The internal arrangement is at once seen from the elevation; the ground-floor rooms are not of first-rate importance, and the windows are subordinated to the great range of state chambers on the first floor, the "piano nobile" of the Italian palaces. These lofty windows have a proportion which is extremely dignified, and the divisions of the sash-bars work out at 20 inches high to 14 inches wide. The window openings, 13 feet high to 5 feet wide—a far narrower proportion than is usual in Italy, and one that Wren was particularly fond of (as, for instance, in the Orangery at Kensington Palace, where the end square windows are 5 feet wide by 13 feet 6 inches high)—roughly speaking, two and a half times the width. The circular windows give a most interesting note to the façades at Hampton Court, and the division of the bars is most ingenious; above the secondary cornice the windows are practically square, and the sash-bar divisions of the same proportion, but on a much smaller scale than those below. It would seem that Wren's idea was to produce an effect of height, and at the same time to indicate the relative importance of the rooms within. The circular windows in the Fountain Court are much more elaborately treated, and are really windows of small rooms, but on the external faces of the façades these small rooms do not always exist, and some of the windows are dummies and only occur at intervals to help the whole design and to break up the wide spaces above the window-heads of the state chambers occupied by the deep-coved ceilings inside. At Greenwich Hospital Wren has combined the circular and rectangular form in one composition with a very pleasing result.

One of the great difficulties of dealing with a Classic order on a lofty façade is that the columns and entablature become so large as to be unmanageable unless the upper floor windows are put above the cornice, and if these are not treated as dormers behind a parapet, the windows are liable to be too small, or, if of the proper size to light the rooms, they ruin the whole proportion. Wren has avoided this by introducing a complete order only as a central incident in the design, and subordinated it to the main crowning cornice and balustrade, which gives ample room for the upper-floor windows. It is by expedients of this description that Wren showed his originality and his mastery over the forms of Renaissance architecture. His power of adapting it to his requirements made it a living art in his hands, and one that was essentially English. His early training, as Mr. Blomfield points out, was rather French than Italian, but throughout his career and his various styles his strong individuality is clearly apparent. His work shows more independence of the accepted architectural forms than any of his contemporaries, but it is noticeable that, as his life and work advanced, he approached more nearly to the Italian manner, as exemplified by Inigo Jones.

The next example, which is instructive as illustrating a different form of window, is the Horse Guards, in Whitehall. We find here that the whole composition is more broken up than is usual in a Palladian design by the varied heights and planes of different parts of the building. The main part of the building was designed by Kent in 1742, with the exception of the attic storey on each angle of the central part and the clock turret, which were added by Vardy some ten years after his death. The composite windows under a single semicircular arch are here used with considerable effect, and give the necessary importance to the larger rooms on the first floor, while the second floor is entirely subordinated and the window openings kept as plain as possible. These rooms are really treated as a mezzanine floor, and it is interesting to compare the arrangement with the Home Office on the south side of the parade ground, also probably by Kent, where the mezzanine windows are omitted in the front and only show on the ends. The result is that a fine solid wall effect is produced with a complete entablature, but at the sacrifice of the interior lighting to these rooms; this is again repeated on the floors above. This plan of disguising the real arrangement of the interior can never be considered as satisfactory, and an angle view, where both faces can be seen simultaneously, gives an unpleasant sensation of something wrong, and the feeling that the interior has been sacrificed to the exterior. In the main façade of the Horse Guards the eye is at once satisfied, but on the end wings the same defect is seen, and the frieze and architrave of the cornice have to be stopped short on the return ends to allow for the windows on the mezzanine floors.

The proportions of the windows themselves are interesting and their relative value to the solid wall surface represents one to three and a half, or rather more window than Inigo Jones's Banqueting-Hall, and rather less than the Vendramini Palace at Venice. But from the greater variety of the shape of the openings the effect produced is very different. The combination of small and large windows is evidently intended to emphasise certain rooms, and in the whole of the fenestration of the Horse Guards and the Home Office Kent made an attempt to give an effect of size to buildings which did not really contain any fine rooms, and, though he certainly produced a very pleasing building, the fact that the exterior does not give a true indication of the internal arrangements, as Mr. Blomfield says, savours of affectation.

I began this paper by saying that the subject of fenestration was practically a history of architecture, and with this last period of the English Renaissance the history of architecture as a living art can be said to cease. All nineteenth-century architecture was a series of revivals, producing little or nothing that was new, and adding no fresh chapter to our subject. We have seen that in all the great periods architecture was indicative of the life and manners of the people. The Egyptians were a theocratic race, and their temples and courts were closed in with the chief ornamentation inside, and dimly lit to suit their religious mysteries. The Greeks were typically republican and their chief effects were reserved for the exterior where all might see. The Romans, true monarchists, built princely palaces, and the plans of their buildings show a degree of luxury and refinement never approached before or since. The Italians of the Renaissance erected palaces which were typical of the life of the time, and in the Gothic period of our own country the great monastic buildings were just as truly characteristic of the life of the people.

In all these great epochs one great principle governed the buildings, namely, they were sincerely designed to suit their purpose as the first consideration. The art may be said to have been an unconscious one—it strove after no effects which were not legitimate, and, though the growth of each detail may be traced backwards to a foundation on something gone before, it was only adopted to suit a

Digitized by Google

requirement of the day, and became inseparably a part of the style. With the facility of travel, the spread of knowledge and rise of individualism, foreign elements in design appeared, which were at first imperfectly assimilated, and, as we have seen, in later times produced insincerity in architecture. Thus one of the great principles was violated, and the lesson to be learnt from the study of our subject to-night is, I think, briefly this :—

Let the plan of a building be fully considered and designed from the first with due regard not only for the requirements but for the exterior, and let the window treatment bear on the exterior its proper relation to the internal arrangements. If the plan is faithfully designed to meet the given conditions it must of necessity reflect the life and habits of those for whom it is intended, and if the window treatment is also faithfully designed to suit the rooms the result will be sincerity in the fenestration.

Mr. E. PRIOLEAU WARREN, proposing a vote of thanks to Mr. Cave, said the subject of the paper was of the highest importance to architects, because the treatment of windows in a building had a general effect on the façade. Mr. Cave had taken them a very long distance from the Egyptian work down to the present day. The history of windows showed the gradual striving for learning and the appreciation of light in buildings, and that of course connoted other things. The desire for light was not natural in primitive civilisation when people did not read, but as the spread of learning grew, so it would be seen that quite chronologically the desire for greater window area increased also. Another factor was the decrease in the need of defensive necessity. It was obvious that in a building which was dependent upon its walls for the exclusion of enemies and their devices the windows must be reduced to a minimum. The church was often deliberately made a sanctuary and fortress. It was frequently assaulted and defended in time of war, and yet in some of the earlier churches in England they would find that the windows, small as they were in troublous times, were larger than those of a succeeding period. It was hard to account for this fact, though one cause may have been the development of European architecture from an Eastern origin. Intense sunlight was unendurable in the East, and the openings in buildings were therefore small, and the architecture, which had been adopted without discrimination, exhibited the same feature, though this would not fully account for the extreme smallness of the windows. It was interesting to observe that as architecture progressed the window greatly increased in size and in beauty of treatment, and they might say the change was the unconscious acceptance of a very important architectural feature. The speaker thought that probably after the fourteenth century the advance of stained glass and the desire for handsomer pictures was the chief influence on the form of the window, and with the introduction of life-sized figures the area of glass was increased at the expense of the wall area of the church. In England, with their comfortable, domestic, practical sense, they had not paid very much attention to the evolution of a feature which in other countries had attracted considerable attention, and that was the dormer window. There were some charming examples, but, generally speaking, in England up to the end of the eighteenth century the dormer window was soberly and plainly treated, whereas in France, Belgium, Holland and Germany it had been developed and elaborated. In England and the Colonies there was more or less an intense desire for the sash window, and in its common treatment the sash window always seemed to lack distinction.

Mr. ALAN POTTER seconded the vote of thanks.

SOCIETY OF ARCHITECTS.

ON the occasion of the visit to the Ilford Crematorium on the 5th inst. Mr. Albert C. Freeman delivered the following address :—

This crematorium was erected by the Corporation of the City of London in 1905 from the design of the late Mr. D. J. Ross, M.Inst.C.E. It is constructed principally of stone, the external walls being faced with Kentish rag, having Portland stone dressings ; the roofs are covered with Broseley tiles. The design, which is on Gothic lines, is in keeping with the other chapels in the cemetery. The total cost of this structure, including the furnace and catafalque, was about 7,000*l*. The chapel is 24 feet wide and 25 feet in length (600 superficial feet). It is not provided with seating. I consider every chapel should have a minimum floor area of 1,200 feet, which will allow of the provision of a small number of seats, in addition to a reading-desk for the minister.

The catafalque here is similar in design to those in the Crematoria at Hull, Golden Green and elsewhere. It is not a design or principle of construction that I should advocate. I certainly think that, considering the catafalque is the principal feature of the chapel, it should be of an artistic design ; the opening into the cremating chamber should also be of a design in keeping with the purpose for which it is adapted. In the majority of the early crematoria erected in this country, great indifference has been displayed in regard to the catafalque, and there has been no attempt at making them architectural features. This may possibly be owing to lack of knowledge in the design, it being a subject so little known or understood.

In the crematoria at Bradford and Sheffield the respective architects have given some amount of thought to the design of the catafalque, resulting in two fine examples—illustrations of these I will show you. The one at Sheffield is executed in bronze, the work having been carried out by the Broomsgrove Guild of Applied Art. The catafalque in general use measures 12 feet long, 3 feet 8 inches wide, and is 4 feet high.

When a cremation is to be performed the coffin is brought into the chapel and placed upon the catafalque. When the committal sentence in the service is reached, the coffin passes noiselessly, by means of an invisible mechanical arrangement into the cremating chamber. The space occupied by the carriage in the cremating chamber—directly opposite the catafalque—is draped with black velvet, so that the chamber is at no time visible to the mourners. In many of the crematoria an intermediate chamber is provided, but up to the present a satisfactory arrangement in this direction has not been planned.

The cremating chamber, at the rear of the chapel, is 37 feet long and 30 feet wide ; it is of sufficient capacity to admit of two furnaces being erected ; only one is at present fixed. A basement is provided under this chamber to receive the lower part of the furnace, and for the purposes of stoking and starting the apparatus.

The furnace is of the regenerative type, designed by the late Mr. Henry Simon. It was fixed by Messrs. Simon, Ltd., of Manchester, and consists of three chambers, the two lower of which are surrounded by air passages. The lower chamber contains a coke fire, and the upper or cremating one is that in which the body is reduced to ashes. The fire is lit some time before the apparatus is to be used, and is supplied with air in the usual way. Before the introduction of the body the air supply to the coke fire is greatly restricted, and after the body has been put in the furnace a separate supply of heated air is introduced to the hot gases from the fire. Owing to the restricted air supply under the fire the product of combustion is largely carbonic oxide, which immediately on the addition of hot air burns into carbonic acid. The incinerating chamber is thus filled with gas of an intensity oxidising character in a state of incandescence. There is no smoke and no visible flame before the body is introduced. The process occupies about one hour, at the end of which time there remains only the residue of the bones, consisting of grey pumice-like fragments. As the body is reduced to ashes they fall through the grid into the chamber below. At the completion of the operation they are swept by an asbestos brush into the urn. It will be seen that inspection holes are provided at the rear of the two upper chambers so that the engineer can see the progress of incineration.

The chimney here is 80 feet high ; it is so constructed that the lower portion of the shaft may be removed without affecting the whole of the shaft or the tower. Above the pilot fire the shaft is carried upon rolled steel joists, built into the walls of the tower. The pilot fire here is of a more elaborate design than that to be found in the early crematoria in this country ; it is provided to cause a draught, and not, as is supposed, to destroy unburned gases given off from the body. I cannot say that I consider this special design of pilot fire (which is necessarily expensive) essential, inasmuch as all smoke and gases are consumed, and nothing but carbonoxides and dioxides are mixed with the atmosphere.

I am at present working upon a scheme whereby the chimney may be dispensed with ; should I be successful one of the most difficult features to treat in connection with these buildings will be removed and a considerable saving made in the cost.

In connection with the furnace there are one or two

Digitized by Google

points I would like to bring before your notice. The first is the construction of a clear space in the floor around the furnace; with this provision any expansion or contraction which takes place will in no way affect the general structure. The furnace should in every case stand 10 feet from the wall of the chapel, this being necessary for transporting the coffin from the catafalque to the furnace.

In conclusion, I think you will agree with me that throughout the whole process of cremation there is absolutely nothing to offend the senses, and there is nothing which is of an irreverent nature.

WINCHESTER CATHEDRAL.

THE annual meeting of the Hampshire Field Club and Archæological Society was held at the Church House, Wolvesey, Winchester, on the 3rd inst.

Prior to the business meeting, says the *Hampshire Advertiser*, the company visited the cathedral for the purpose of hearing an account of the present work of repairing the fabric, an inspection of which was afterwards made. The party were received at the west door by Canon Braithwaite, who extended a welcome to those present. Entering the building in company with Mr. T. G. Jackson (consulting architect) and Mr. J. B. Colson and Mr. N. C. H. Nisbett (cathedral architects), the company proceeded to the retro-choir—which is now a mass of timber supports—and assembled around three large plans showing the structure of the fabric now in course of preservation. These plans at once conveyed to the mind the exact nature of the defects, and were explained in detail by Mr. Jackson. He described the formation of the strata at the east end, and pointed out that the top soil was of comparatively modern formation, for when the water-level was reached cherry stones and apple pips and pieces of Roman pottery were discovered, showing that centuries ago the water-level must have been lower than it now was. Since then the surface of the valley and the bed of the river had risen together with the water-level, and the soil was now 3 or 4 feet higher. In order to obtain a good foundation the builders of the cathedral should have gone below the peat to the hard gravel bed, which rose a great deal towards the west end, which showed no sign of the mischief found at the east end. When the builders got to the bog and came to the water they were in a fix, not having the modern appliances of a steam pump and quick-setting cement, and consequently used the marly bed, which was fairly firm, and the best they could do. Not knowing how to get below the water, they laid the foundations on the trunks of trees filled in with chalk and smaller trees. Sometimes the distance between the two layers was 18 inches, and this was filled in with chalk. Some of the trees were quite decayed and others had stood extraordinarily well considering that most were of beech and not oak. When the trees decayed the marl bed gave way, and the cathedral sank about 2 feet. They intended now to lay the foundation on the gravel bed, which would make a capital foundation. They were able to get to within 2 feet of the gravel, and when the last 2 feet, which were of peat, were reached the water rose to 14 feet. As there was a danger of the silt being drawn away from the foundation by the steam pump the employment of divers was resorted to, and these were now engaged in scooping out the 2 feet of peat and filling up the cavity with sacks of cement in layers grouted with cement. This would keep the water down, and after the water above had been pumped out the ordinary workman would be able to underpin the foundations. The new foundations would stand in water, and would get harder and harder, and the cathedral would then for the first time in its existence be on a rock. In addition to this there was another disruption in the building owing to the thrust of the vaulting, which Mr. Jackson explained. The buttresses of De Lucy's building, erected in 1206, were not at all beyond what they should have been, and were just the bare margin of safety. Had the ground been firm they might possibly have sufficed, but being built on spongy ground which gave way, the whole of the piers had gone down. The thrust on the piers had caused a crack to appear, and the pier had gone out of the upright. The cracks in the roof had reopened, and the thrust had at once to be arrested. The alternative was to enlarge the outside buttresses, which would have involved going down to a great depth. To alter the buttresses appeared to him to interfere with the architectural feature of the building outside, and as the alternative of two evils he suggested ties being used. They would be painted grey, and not conspicuous. A thing of that kind when it exposed its reason and showed its utility was a blemish which he thought the eye condoned and which would not offend. There was hardly a church in Italy which was not held up by iron ties, and which he thought in this case would not attract attention.

Specimens of peat and of the bogs dug from beneath the foundations were inspected with interest, after which thanks were accorded to Mr. Jackson for his lucid explanation. The company then left the interior of the building to inspect the external work at the east end. Here the operations were watched with interest, particular attention being paid to the diver, who descended and ascended for the benefit of the company, the more enthusiastic of whom used the camera probably with good results. A visit was paid to the crypt, and subsequently the architectural features of the fabric were explained by Mr. J. B. Colson, who humorously remarked that it was untrue that the building was tottering to its foundations from end to end, as had been stated. He pointed out that the gravel bed at the west end was 27 feet below the surface, but dropped to 16 feet at the east end.

The Rev. G. W. Minns thanked Mr. Colson for his explanation, and complimented the Dean and Chapter on calling in Mr. Jackson for advice. Under the supervision of Messrs. Colson and Nisbett, who were acquainted with every stone in the cathedral, they felt the work would be efficiently and properly done. They quite sympathised with the Dean and Chapter in the difficulties they had to contend with, and he hoped they might have an opportunity later on of helping them.

WATER SUPPLY FOR ESTATES, INSTITUTIONS, &c.

By F. J. Warden-Stevens, A.M.I.M.E.

THE arrangements for the water supply, storage and maintenance of pressure here described are to some extent a departure from the general practice and offer considerable advantages. This description should therefore be of interest to architects who are concerned with residential flat buildings and estates as well as public institutions.

The buildings under consideration required a supply of water for some 2,000 persons, apart from the general supply for boilers, laundry use, flushing, &c.

The supply has been divided into three sections, pure, subsoil and fire. The pure supply is obtained from deep wells, which consist of borings 8 inches in diameter and 300 feet deep; the supply for flushing, &c., is from a boring 12 inches in diameter and 40 feet deep; and the supply required in the event of fire can be arranged from either source.

In connection with an independent water supply it was necessary to provide water storage to at least the extent of 20,000 gallons, and to be of real use for fire purposes, part of this storage had to be at a pressure equivalent to a head of at least 100 feet. Now, owing to the very unsatisfactory nature of the foundations, the writer, after careful consideration, decided instead of building a water tower to a height necessary for this pressure to have two steel drums, each having a capacity of 2,650 cubic feet and each to be designed to hold 8,000 gallons of water, leaving a space above for an equal volume of air. One of these drums was designed for a working pressure of 30 lbs. per square inch and the other for 60 lbs. per square inch, equal to 69 and 138 feet head of water respectively. Each drum is 14 feet in diameter by 20 feet high, and is supported round the outer circumference on iron columns resting on a concrete base. To the top of each drum is fixed an air-pipe, and to the bottom there are attached draw-off connections. The drum for 30 lbs. pressure is connected to the ordinary pure supply mains and the 60 lbs. pressure drum to the fire service. In working, when the requisite quantity of water is stored and the pressure is lower than it should be, compressed air is delivered to the drum to raise the pressure to 30 or 60 lbs., as the case may be. The air is then acting as a cushion, the pressure falls slightly as water is drawn and the air is again compressed as water is pumped in. The result of this arrangement in general use is that compressed air is added only occasionally to make up for leakage or absorption. In the event of it being required to keep

Digitized by Google

up the pressure to the full amount while a supply is being drawn from the drum, the air compressors are brought into use, should the demand for water greatly exceed that which can be supplied by the wells. The top of each drum is arranged for the fixing of an open tank without difficulty, and on the high-pressure drum a tank holding 8,000 gallons has been provided, the curved top of the drum forming the bottom of the open tank. This tank can be used as a reservoir for the condensing water in connection with the engines, and from it is taken also the low-pressure subsoil supply for flushing purposes, &c.

The distribution of the supply is carried out by three distinct arrangements of mains. The supply referred to as pure is kept at a maximum pressure of 30 lbs. per square inch, as already mentioned in connection with the storage. The mains consist of pipes 3 inches in diameter, laid from a deep well in the engineering works along the east and west corridors to another deep well at the extreme west of the buildings, there being branch pipes of 2-inch diameter along the north corridor. From these mains a direct supply is obtained in a few instances on the ground floor, such as the laundry, but in most cases the services are from tanks fixed in the roofs.

By lowering the pressure on the pure water mains at times of heavy demand in the laundry, &c., the wells can supply this direct and not fill the upper tanks, which are dealt with when the demand is less. This enables the wells to be kept in use for a long period at a moderate output, which increases the economy of working.

The flushing, &c., water is distributed by pipes of 3 inches diameter from the works laid along the east corridor, whence it branches north and west with pipes 2 inches in diameter. This supply is intended to serve the automatic flushing tanks in connection with the sewers and the ground-floor latrines, &c. No open taps are connected, so that this water could not be used for drinking purposes. The object of this supply was to relieve the deep wells of a large and steady demand for water which need not be pure and for which a supply could be made available from a comparatively shallow well.

The mains for the fire service are all of one size, being 4 inches in diameter. From these mains are rising submains up every staircase, to which hydrants are fixed. In all cases services for any other purpose have been disconnected from the fire mains and connected to the pure or subsoil mains as required. The pressure in the fire mains, as mentioned, is kept at equivalent to 138 feet head, and as the highest building is 60 feet, the roofs can easily be reached from the ground level by means of the hydrants, allowing a large margin for fall of pressure in the hydrants and pipes.

In arranging for carrying out this scheme of reconstruction it was found that a very considerable length of pipes, a large portion being useless, were buried in the corridors and yards, and it was considered advisable to arrange to have practically all main pipes in trenches where they would be accessible. As a result, trenches 7 feet wide and 3 feet deep were constructed in the east and west corridors of the buildings, a length of 384 feet; branching from these along the north corridor, trenches 3 feet 6 inches wide and 3 feet deep, a length of 170 feet.

They are constructed of coke breeze concrete arches, supported in the centre in the case of the larger trenches by steel girders running the whole length of the corridors, and carried by short columns. Also at every alternate 9 feet of the length removable covers are provided to give access to the trenches. The opening when the covers are removed gives 9 feet clear, so that any ordinary length of pipe may be lowered into the trenches. The roof or covering of these trenches or subways forms the floor of the corridor.

The construction of these trenches was a matter of some difficulty, as the traffic in the corridors could not be stopped, and during the removal of the drains, hot and cold-water and steam-pipes, the services to the premises were maintained. It is to be noted that each of the seven principal blocks abut on the corridors, and subsidiary trenches were constructed for the reception of service pipes where necessary.

These water-supply arrangements were adopted in lieu of an old system of one supply for all purposes, by which, for instance, should a fire occur when the demand for water was high for other purposes, the pressure would be insufficient, and water had to be paid for from the water company at the same rate to flush the drains, &c., as for drinking purposes. Meters are connected to the mains to measure the quantity used on the pure and subsoil supply, and the water company's high-pressure connection is at present maintained both to the fire and pure water supply and the low pressure to the pure and subsoil water only. The pure water may be used in the subsoil mains at any time if needed, and the fire and pure water services may be interconnected.

THE VIBRATION OF TALL BUILDINGS.

THERE is no single feature of last week's catastrophe in California of higher technical interest, says the *Engineering Record*, than the resistance of structures of the best modern design to the severe earthquakes which brought havoc to a strip of coast several hundred miles long. At Leland Stanford Junior University some of the best of the concrete buildings, notably those constructed by Mr. E. L. Ransome, were uninjured, while other structures were more or less damaged. This is not at all surprising, because some of the buildings that failed were architecturally unsuited to resist a severe shaking, while among those which were uninjured are buildings designed specially to withstand earthquakes. It is unjust to judge the value of various building materials by the effect of the shocks of last week unless attention is paid at the same time to the designs of the structures in which they were used. A good material may be used in such a way that it offers little resistance to fire and earthquake, while skilful design may produce far better results, considered from the point of view of stability alone, with building materials of a relatively lower character. It is on this account that the information to be gained from the present condition of masonry structures, particularly those of concrete, can be accepted only after the closest scrutiny.

While it is impossible to form now any accurate judgment of the detailed resistance offered to earthquakes by concrete structures, the admirable manner in which steel-cage construction of a good character withstood the earthquakes is manifest. The most conspicuous structure of this type in the city, the Spreckels Building, where the "Call" had some of its offices, was injured only by fire. This building was a remarkable structure, and the manner in which it withstood the shocks is most gratifying. The same is true of the condition of other steel-cage buildings of less height but greater area. Many of these were specially designed to resist earthquakes, and the fact that in some cases they were supported on material not particularly favourable for office building sites makes their recent resistance to violent vibration all the more remarkable.

Accurate observations of the vibrations of tall buildings are extremely rare. Among the few of them mention may be made of those by Mr. W. L. Stebbings in the Monadnock Block and Pontiac Building, of Chicago, during a high windstorm about eight years ago. His first observation was in the Monadnock Block and was made by a plumb line in the stair-well reaching from the sixteenth down to the second floor. After the plumb line was released from its initial twist sufficiently to allow the bob to move under the direct tension on the string, the bob described a circle approximately one-half inch in diameter while moving under the swaying motion of the building caused by the wind. This observation was made with the point of the plumb bob about one-sixteenth of an inch above a sheet of paper on a drawing-board. When this observation was repeated in the south stair-well of the same building from the seventeenth floor the point of the bob described an elliptical path with an axis of seven-sixteenths of an inch in one direction and three-eighths of an inch at right angles to the first. The next observation of precisely the same character was made in the Pontiac Building with the plumb line extending from the fourteenth down to the first floor. The elliptical path of the point of the plumb bob in this case had axes of three-eighths and one-fourth inch. Mr. Stebbings was of the opinion that this building was protected by the adjoining Elsworth Building, since it did not receive the full force of the wind.

It is, of course, a matter of doubt whether the motion of the plumb bob in such a case indicates the real motion of the building in its true magnitude, although it certainly would not oscillate if the building had no motion. Mr. Stebbings realised that this might be the case, and therefore made transit observations from a completely protected position on the north-west and south-west corners of the Monadnock Block. At the north-west corner he found an extreme vibration of one-fourth of an inch, and one-half an inch at the south-west corner. During the progress of

Digitized by Google

these observations the velocity of the wind, as gauged by the usual conventional methods, varied from 60 to 70 miles per hour, and at least a dozen waggons were overturned at the south-east corner of the building during the day.

These tests cannot be considered conclusive as to the actual motion described by the buildings under the action of the winds to which they were subjected, for the path described by the plumb bob is probably not just that traversed by the upper extremity of the line to which it was attached. Yet inasmuch as the observations extended over a considerable period of time, it is certain that had the upper parts of the buildings any great amount of motion the plumb bob would have described a correspondingly increased path. The fact that the latter was small may be taken as showing that the wind produced a series of correspondingly small effects, and this conclusion is confirmed by the observations with the transit.

The vibrations due to the earthquake were much greater, sufficient to toss people about in the rooms of some of the well-built hotels. Unfortunately it takes very little jarring of a platform to produce this effect. A shaking of but a very few inches on the movable stairs at summer resorts makes their ascent and descent a very trying feat. It is impossible, therefore, to estimate from the statements of people who were in San Francisco during the earthquakes what was the amplitude of vibration of the important buildings. The pendulum of the seismograph of Professor George Davidson, Hon.M.Am.Soc.C.E., was thrown off the register, indicating that the motion was very violent. On the other hand, the enormous masses of the larger office buildings probably operated to keep the vibration in them below that in the rows of flimsy tenement houses on the unstable filled ground to the east of them. While opinions concerning details of design cannot be formed in the light of present knowledge, it is certain that the steel-cage framing used in the better class of buildings has demonstrated its suitability for a city exposed to earth tremors and shocks. The problems of wall and floor construction alone are debatable.

THAMES BRIDGES.

AN interesting pamphlet by Mr. Maurice Fitzmaurice, the chief engineer, entitled, "Notes on the Acquisition, Construction, Works and Maintenance of the County Bridges, Tunnels, Ferry, Embankments, and River Prevention of Floods Works in the County of London, together with Descriptive and Explanatory Notes on the Structure, Works and other Technical Matters," has been issued by the London County Council. The following is from the introduction :—

From very early times the provision and maintenance of bridges has been considered a matter of the highest public importance; indeed, the expense of maintaining bridges was part of that *trinoda necessitas* to which, by ancient law, every man's estate was subject. The construction of bridges was, of old, sometimes performed by individuals as a commendable work of charity, but more generally bridges were made by distraint or levy. One of the provisions ("No town or freeman shall be distrained to make bridges at streams, but such as of old time and of right ought to make them") of *Magna Carta* was directed against an undue extension of this obligation, and the provision was included in the various reissues of the Charter during the reign of Henry III.

The next important legislation on the subject was the celebrated Statute of Bridges, 1530. We are told therein that "in many parts of this realm it cannot be known and proved what hundred, riding, wapentake, city, borough, town or parish, nor what person certain, or body politick, ought of right to make such bridges decayed, by reason whereof such decayed bridges, for lack of knowledge of such as owen to make them, for the most part, lie long without any amendment, to the great annoyance of the king's subjects." Justices were therefore authorised to "inquire, hear and determine, in the king's general sessions of peace, of all manner of annoyances of bridges broken in the highways, to the damage of the king's liege people," and to order "the speedy amendment of such bridges," such repairs to be carried out, in the absence of any proof of responsibility attaching to any particular authority or person, by the inhabitants of the shire or riding, or city or town corporate, wherein the bridges happened to be. The same Act authorised the appointment of surveyors to see that repairs were carried out, and a further section required that the roads at the ends of bridges for a distance of 300 feet should also be maintained. The last-mentioned requirement was modified by the Highway Act, 1835, which, in the case of all bridges recognised as county bridges after that date, limited the duty of maintenance to the bridge and "the walls, banks or fences of the raised causeways and raised approaches to any such bridge, or the land arches thereof."

Henry VIII's statute did not give authority for the purchase of land for the purpose of rebuilding or enlarging county bridges. In 1740, however, the County Bridges Act of that year authorised the purchase, by agreement, of land, not exceeding 1 acre in extent, for such purpose. This authority was extended by the County Bridges Act (Lord Ellenborough's Act), 1803, giving powers for the repair or improvement of county bridges, or the reconstruction of such bridges within a distance of 200 yards of the existing bridge, and authorising the acquisition, either by agreement or compulsorily, of any land, not exceeding 1 acre in extent, which might be required in connection with altering the situation of or widening or enlarging any such bridge. The same statute further provided that no bridge thereafter to be erected should be deemed a county bridge unless built in a substantial and commodious manner, under the direction or to the satisfaction of the county surveyor.

In the year 1870 it was provided that in the case of turnpike roads becoming ordinary highways, all bridges which were previously repaired by the turnpike trustees should become county bridges, although it was set forth that such bridges should be treated as if they had been built subsequently to the passing of the Act of 1835. Accordingly, in the case of bridges which became county bridges in accordance with this provision, only the maintenance of the bridge and of the raised approaches devolves upon the country authority, and not that of the road for 300 feet on both sides.

By Section 3 (viii.) of the Local Government Act, 1888, the administrative business of the Justices in Quarter Sessions relating to bridges and roads repairable with bridges was transferred to the Council.

The bridges in question were as follows :—

Wholly within the County of London.

Beckenham Lane Bridge, Blackhorse Bridge, Brockley or Ladywell Bridge, Catford Bridge, Deptford Bridge, Eltham Green Bridge, Lee (Lewisham) Bridge, Lee Green Bridge, Lee Road Bridge, Lewisham Bridge, Mill Bridge, Plough Bridge, Pool Bridge.

Partly within the County of London.

Beverley Bridge, Barking Road Bridge, Bow Bridge, Hermitage Bridge, Lea Bridge, Lower Tooting Bridge, Priest's Bridge, Roe Bridge.

Of these bridges, Brockley and Catford bridges were at one time county bridges, carrying Ladywell Road and Catford Hill respectively over the river Ravensbourne, but the viaducts which now carry these thoroughfares over the South-Eastern Railway were built over the two small bridges, and are now maintained by the railway company. Lower Tooting Bridge was constructed over the river Graveney under powers conferred by the Tooting, Merton and Wimbledon Railway Act, 1864, and under the provisions of that Act its maintenance is undertaken by the London and South-Western and London, Brighton and South Coast Railways joint committee.

Since the passing of the Local Government Act, 1888, the Council has recognised the bridge carrying Seven Sisters Road over the New River and that carrying High Street, Wandsworth, over the river Wandle, as county bridges. Highgate Archway, although it does not carry a main road over any stream is, in accordance with the provisions of Section 36 (ii.) of the London County Council (Improvements) Act, 1894, to be maintained and repaired as a county bridge. Most of these bridges are small, and situated on or near the county boundary. Whilst, therefore, the Council still carries out special works required to the structure of these bridges, it has been found more convenient and economical for the care of the roads over them to be undertaken by the various metropolitan borough councils, the Council paying those authorities for the work performed.

In addition to those county bridges, the liabilities in respect of which were transferred to the Council from the Justices, certain bridges which came under the control of the Council as the successor to the Metropolitan Board of Works are also county bridges These consist of the various bridges, other than railway bridges, spanning

Digitized by Google

the Thames to the west of Blackfriars Bridge up to and including Hammersmith Bridge and the bridge over Deptford Creek.

Westminster Bridge and Chelsea Bridge had been constructed by the Government, but with these exceptions all the above bridges had been built, and previous to the year 1877 were maintained, by private companies under powers conferred by special Acts of Parliament. Westminster Bridge was free, but in the case of all the others tolls were payable, even in respect of pedestrian traffic. The payment of these tolls was a source of intense public dissatisfaction, and was in particular productive of great hardship to the labouring classes. For many years the necessity for some steps being taken to remedy the evil was kept prominently before Parliament, and no less than six select committees of the House of Commons were appointed at various times from 1836 to 1876 to consider the question. Finally, in 1877, the Metropolis Toll Bridges Act was passed, which provided, *inter alia*, for the purchase by the Metropolitan Board of Works of the interests of the various private companies and of H.M. Office of Works in the following bridges:—Waterloo, Lambeth, Vauxhall, Chelsea (or Victoria), Albert, Battersea, Wandsworth, Fulham (or Putney), Hammersmith and Deptford Creek. Provision was also made for the acquisition of all the interests of the South-Eastern Railway Company with respect to rights of way or passage over the footbridges by the side of Charing Cross and Cannon Street railway bridges, including all powers with regard to tolls and charges. The Act further provided that, on the completion of the purchase of any of the undertakings, the tolls and charges arising from or in connection with the bridge or bridges comprised in such undertaking should cease to be levied thereon, and the said bridge or bridges should be open free to the public. The amount of compensation (exclusive of costs) paid by the Board in carrying out the requirements of the Act was 1,376,825*l.*

Except in the case of the two footbridges mentioned above, provision was made for the various bridges and the roads over the same to be maintained and repaired by the Board. It was consequently enacted that the bridges should not be or become county bridges, which would involve their maintenance by the counties of Middlesex and Surrey, but that these two counties should each contribute 1,200*l.* a year towards the cost of maintenance. In accordance, however, with Section 90 of the Local Government Act, 1888, which required these payments to be deemed liabilities which should be taken into consideration upon the necessary adjustment of the property, debts and liabilities between the counties of Surrey and Middlesex respectively, and the county of London, the payment made by Middlesex was abolished and that of Surrey was reduced to 133*l.* 6*s.* 8*d.* (in respect of Hammersmith Bridge). Inasmuch as, by the constitution of the Administrative County of London under the same Act, the bridges in question were no longer (except partially, in the case of Hammersmith Bridge) in the counties of Middlesex and Surrey, the reason against their classification as county bridges no longer existed. Moreover, it was even desirable that the bridges in question should be so classed in order to bring them within certain provisions of the statutes relating to county bridges. Accordingly, application was made to Parliament to enable this to be done, and the necessary powers were obtained by Section 46 of the London County Council (General Powers) Act, 1895.

Westminster Bridge, which had been transferred to the Metropolitan Board of Works by the London Parks and Works Act, 1887, also became a county bridge under the provisions of the Act of 1895.

Section 6 (ii.) of the London Government Act, 1899, provides that where a highway in a metropolitan borough is repairable by the Council by reason of its being the roadway or footway of a bridge, the borough council shall, if so required by the Council, undertake the maintenance and repair thereof in consideration of such annual payment by the Council as may from time to time be agreed on, or in default of agreement be finally determined by the Local Government Board. On November 27, 1900, the Council took into consideration the question of transferring, under the powers of the above section, to the metropolitan borough councils the duty of cleansing the county bridges across the Thames, but decided that it was inadvisable to take such a course.

Of the bridges under the Council's control spanning the river Thames, Waterloo and Putney bridges are built of stone, while Westminster, Lambeth, Chelsea, Albert, Battersea, Wandsworth and Hammersmith are of iron or steel. The latter method of construction involves periodical repainting, and it has been found that as a rule this work should be undertaken every five years. With the exception of Battersea and Putney bridges, where granite setts are used, the carriageways of all these bridges are paved with wood, and this form of paving requires periodical renewal more frequently than does the former. Endeavours are made to insure that these periodical repairs are distributed so that the cost does not fall unduly upon the rates of any one year.

THE SURVEY OF SPARTA.

IN a letter to the *Times* appealing for aid towards the expenses, Mr. G. A. Macmillan gives the following account of the progress of exploration on the site of Sparta:—

The walls of the city have been traced for four-fifths of their extent, and are ascertained to be not Byzantine, but Roman in period. It seems likely that the adjacent *enceinte* was cleared of buildings in Classical times for strategic purposes. The excavators think that the ancient city may have included the area between the low hill which served as an Acropolis and the river Eurotas, in which case our notions of Spartan topography must be revised.

The second point of interest has been the investigation of the theatre, hitherto the only identified site of the ancient city, where a life-sized statue of Asklepios with portions of reliefs probably belonging to the proscenium have been found.

But the most important result obtained has been the identification, attested by inscriptions, of the site of the Temple of Artemis Orthia, which we know from Pausanias to have been the scene of the chastisement of the youths of Sparta, where enormous finds of votive offerings have been made. The scene of the discovery is a field on the right bank of the Eurotas, about half a mile to the south of the modern bridge. From time to time boys playing in the river bed had picked up little figurines of lead. Similar figurines having been found some years ago in the excavations at the shrine of Menelaos on the opposite side of the river, the British excavators suspected the existence of a second sanctuary, and made a trial here on April 7. Within a few hours it was clear that the site contained an immense deposit of votive offerings. During the past fortnight a few skilled workmen, working slowly with knives, have extracted many thousands of these peculiar figurines. At least fifty variant types have been found, representing divine and human figures, musicians, centaurs, sirens, fish and other animal forms, with inanimate objects, including altars, wreaths, vases, helmets and mirrors. If the material and the modest scale of the offerings seem to illustrate the traditional simplicity of Spartan usage, their number proves the importance and popularity of the cult. Nor are offerings of more costly material wanting. The ivory carvings include two statuettes in the round, a lion, four figures of rams, a helmeted head and a number of discs, combs and pins. In bronze there are statuettes of a horse and a dog, and large fragments of bowls and caldrons richly decorated in repoussé work. Smaller objects of both gold and silver have been found, including a silver pin with fine spiraliform decoration. Terra-cotta statuettes in great variety have come to light with large quantities of pottery. Apart from this deposit, upwards of 100 inscriptions have been found since the work began.

In the temporary absence of the director at Athens Mr. Guy Dickins, of New College, Oxford, has been in charge of the work, and in the course of these excavations has located the temple and traced two of its sides. For the moment progress has been impeded by a mill stream which runs through the *temenos* and intersects the temple. Before further excavation can be attempted it will be necessary to expropriate the land and divert the stream. The discovery of the lost temple coincided with His Majesty's arrival in Greek lands, and was made the subject of a gracious message of congratulation to the director of the school, Mr. R. C. Bosanquet, who is in charge of the excavations.

Broadly speaking, the deposit described above consists of objects which may be assigned to the sixth and fifth centuries before our era. The pottery is largely of the "Orientalising" types, and the presence of scarabs and other imported objects confirms what has already been suspected—the presence of strong Oriental influence in Laconian art of the archaic period. The site is one of exceptional promise, and more than justifies the selection

Digitized by Google

of Sparta as the scene of the labours of the British school, when it is remembered that the results enumerated above come from the mere fraction of the temple precinct that has been opened. Until to-day archæologic research has done little or nothing to add to our knowledge of the State which vies with Athens herself for the commanding place in Hellenic history, and it rests with us to see that the work thus happily inaugurated is adequately sustained. The Greek authorities under Dr. Cavvadius are extending their usual courteous co-operation by erecting secure quarters for the reception of the finds, and in this and in other matters the Spartan Ephod, M. Soteriades, is an efficient ally. But the depth of earth is unexpectedly great, the rate of wages is higher than has hitherto been the case, the question of expropriation has to be faced, and it will be necessary to secure permanent quarters for the excavators in the neighbourhood.

GENERAL.

The King has consented to become patron of the second International Congress on School Hygiene, to be held in London from August 5 to 10, 1907.

Mr. Ernest W. Dyson, architect, Barnsley, has been successful in the competition for an Independent Methodist church at Harwich.

The Royal Institute of Painters in Water-Colours, Piccadilly, at their last meeting elected the following gentlemen as members:—Messrs. A. D. McCormick, E. Borough Johnson, Norman Wilkinson, Moffat Lindner, H. M. Brock and Ernest E. Briggs.

The Very Rev. H. D. M. Spence-Jones, dean of Gloucester, has been appointed Professor of Ancient History at the Royal Academy of Arts.

The Maidstone Town Council have appointed a sub-committee to catalogue and otherwise deal with the Corporation documents.

The York Architectural Society at their annual meeting elected the following to serve on the executive for the session of 1906-7:—President, Mr. Arthur Pollard; vice-presidents, Messrs. S. Needham and A. A. Gibson.

The Architectural and Archæological Society of Durham and Northumberland decided at their annual meeting to have a two days' excursion to York. Canon Greenwell, president, said nothing had been discovered at Durham Cathedral during the past year. He referred to the misuse of Galilee chapel in the cathedral by students attending morning prayer, and suggested they should be seated in the nave. He protested against certain portions of the castle being at present used as lodgings for students, adding that in the event of fire the whole of the building would probably be destroyed.

The Villa Palmieri, at Florence, when offered for auction by Messrs. Trollope, failed to find a purchaser. The auctioneer commenced by inviting a bid of 30,000*l.*

Three Paintings have been purchased under the Chantrey Bequest from the Royal Academy, viz. *Birnam Wood,* by Mr. D. Farquharson; *The Heretic,* by Mr. F. Craig; and the *Deserted Mill,* by Mr. Leslie, R.A.

A Waterworks Engineering Expert is to be engaged by the Dublin Corporation to report on the plans and specifications for the new Vartry reservoir, at a fee not exceeding 200*l.*

The Success of the Dunfermline Hygiene College, which was established by the Carnegie Dunfermline Trust, has induced the Trust to extend the college residence or hostel. At the Dean of Guild Court on Monday plans were passed for additions to this establishment and for the conversion of part of the property abutting on Canmore Street into a gymnasium.

A Special Committee in Glasgow who had 700*l.* placed at their disposal recently to purchase sculpture from the present exhibition of the Royal Institute of Fine Arts, Glasgow, have resolved to offer 700*l.* for the bronze study, "Springtime of Life," by W. Robert Colton, A.R.A. Of this sum 300*l.* is given by the Glasgow Corporation, 300*l.* by an anonymous donor and 100*l.* by the Institute.

Over Fifty Applications have been received for the position of surveyor to the Corporation of Birmingham, vacant by the death of Mr. John Price. A sub-committee will make a selection. The appointment will not take place before the June meeting of the Council. The salary is 1,250*l.* per annum.

Two of the District Surveyors of the Metropolis have resigned their appointments, viz. Mr. Hugh McLachlan, of the western division of the City of London, and Mr. Charles James Badger, of Lewisham.

A Roman Mosaic Pavement was recently unearthed in the parish of All Saints, Dorchester. The Rev. S. E. V. Filleul, the rector, presented the pavement to the daughter town of Dorchester in the United States. The rector has received a letter from the president of the high school in that town stating that the pavement has been carefully laid by Italian workmen at the main entrance of the new school buildings.

The Church of St. Michael, Burleigh Street, Strand, which was closed by an order of the Privy Council dated August 8, 1905, owing to the property of the parish becoming more of a business and less of a residential character, has been purchased by the Commissioner of Woods and Forests on behalf of the Crown, the present owners of the adjoining properties in Burleigh Street and the Strand, for the sum of 20,500*l.*, which was at least 5,500*l.* below the auctioneer's expectations. This sum of money will be devoted to raising a new church and vicarage at Sutton Court, Chiswick.

The Linlithgow Town Council have decided that the town clerk should be instructed to write to H.M. Board of Works expressing the Council's appreciation of the interest that was being taken by them in the restoring of Linlithgow Palace, and to respectfully suggest that the Parliament Hall and the chapel should be roofed in.

The Birmingham Museum and School of Art Committee in their annual report state that during twenty years the gallery has been visited by more than 13,000,000 people; more than twenty special loan exhibitions have been held, to which some 700 owners have lent 6,288 pictures and 4,970 objects of art; about 315 pictures and water-colour drawings, 500 drawings and 900 engravings and etchings have been added to the permanent collection, which is now of a total value of more than 135,000*l.*, the value of the gifts during that period being estimated at 80,000*l.*; and seventy-eight catalogues have been issued, of which 331,315 copies have been sold, more than 280,000 of them at the price of one penny, and 10,612 photographs of the pictures and art objects.

The Foundations of Liverpool Cathedral are completed, and preparations are being made for the laying of the foundation-stone of the Lathom chapter-house on the 25th inst. The ceremony is to be performed by H.R.H. the Duke of Connaught, full Masonic rites being observed. At a meeting of the executive committee on Monday letters were read from Sir Hardman Earle offering a window in memory of the late Sir Thomas and Lady Earle; from Mr. Moon offering a marble pavement for the choir, in memory of Sir R. Moon; and from a Liverpool citizen stating that he had made provision in his will for the cost of a peal of bells for the cathedral—about 2,000*l.*

The Finance Committee of Aberdeen Town Council have had under consideration the question of the maintenance of the Art Gallery. It was agreed that until a Bill could be promoted in Parliament to place the maintenance of the Gallery on the rates a recommendation should be made to the Gallery committee not to exceed an expenditure of 500*l.* per annum. It was stated that it would be some fifteen months before rating powers could be obtained from Parliament, and that the expenditure up to that time would probably amount to from 1,200*l.* to 1,500*l.* An announcement was however made that the Clark Trustees had intimated another donation of 4,000*l.*, which would relieve the Gallery committee of the debt of about 4,000*l.* on the new buildings. This brings the donations of the Clark Trustees to the Gallery to 12,000*l.*

Professor Flinders Petrie will commence a course of lectures at University College, London, on the 17th inst. The subject will be "Hyksos and Israelite Cities."

The Conditions of the international competition for the memorial of Shakespeare in London will shortly be announced, and the designs will be exhibited next year. A donation of 1,000*l.* by Mr. Richard Badger will be assigned to prizes.

Mr. Batsford is preparing a work on "English Domestic Architecture, chiefly of the Tudor Period," by the late Thomas Garner. There will be 150 folio plates, besides plans, &c., with an historical and descriptive text.

The Architect.

THE WEEK.

ENGLISH architects are rarely disposed to enter into competitions on the Continent. It is, therefore, not to be considered as a British failure if the names of representatives of this country are absent from the prize list of the Palace of Peace which is to be erected at The Hague. The cost of erecting the building will be borne by Mr. CARNEGIE, and an Englishman, Mr. T. E. COLLCUTT, was one of the judges. But the first and second prizes of 1,000*l.* and 750*l.* respectively are to be added to the long list of French successes, the design of M. L. CORDONNIER, of Lille, having attained the foremost place, and M. MARCEL, of Paris, the second. Herr WENDT, of Charlottenburg, Berlin, takes the third prize of 583*l.*, while the fourth, of 460*l.*, was awarded to Herr OTTO WAGNER, of Vienna. An extra prize of 250*l.* was given to Messrs. HOWARD GREENLEY and H. S. OLIN, of New York, and another of equal amount to Herr SCHWECHTEN, of Berlin. Two Frenchmen, two Germans, an Austrian and an American firm have therefore been distinguished in the competition, which may have in consequence a claim to be considered international. M. CORDONNIER'S design is suggestive of France and of Holland. It cannot be said, however, to possess the repose which would be most expressive of a Palace of Peace. Vertical lines predominate, and there is a general effect of restlessness, but that may be considered desirable in a country which is level and where buildings have a tendency to be horizontal in style.

TECHNICAL education being the greatest need of the Irish people, it ought to be encouraged as much as possible. But much progress is not likely to take place if committees are allowed to have only a nominal authority and are compelled to obey the demands of the Government office, which in this case is known as the Department of Agriculture and Technical Instruction. A case occurred quite recently which suggests the tight hold which the officials of the Department have in dealing with local authorities. Ball's Bridge, which is a suburb of Dublin, contains some of the institutions of that most useful body, the Royal Dublin Society. It was, therefore, quite natural that the Council of the township should set up a technical school in the village. The Department sanctioned a scheme by which the master of the school was to be paid 300*l.*, with an assistant at 150*l.* a year. For useful men the sums are inadequate. After a time the local Council increased the salary of the master to 350*l.*, the money being obtained by reducing the salary of the teacher. To the arrangement the Department objected, on the ground that authority should have been obtained beforehand. An inquiry was therefore ordered, which certainly will cost more than the increase given to the master. It was argued on one side that those who had to pay the money should control its expenditure; while for the Department it was contended that once an institution came under its control it was always under its control, in respect of finance as well as other things. It is not to be expected that the ordinary elected representative can judge of technical instruction, but he is able to decide whether money is wasted or not, and to deprive him of that privilege is impolitic.

IT is an unwise policy for contractors to come into collision with any of the engineers or officials of the metropolitan boroughs. It is not the same as dealing with an ordinary engineer or architect respecting work for a private client. Union is strength in metropolitan affairs, and it can be exhibited in a variety of ways by which a contractor will incur losses for which it is poor consolation to be able to say he has fought a good fight. A case of the kind is now taking place in Kensington. A contract was given to erect a destructor. Apparently everything went on satisfactorily until a dispute arose respecting the granting of a certificate. No doubt the delay caused inconvenience, for in such structures there must be a series of cells, and if one does not operate properly they are all affected. Thereupon the borough engineer was authorised to consult Sir ALEXANDER BINNIE, who has a reputation in the Courts, and he testified in his report to whatever he considered was unsatisfactory. To aggravate matters, the London County Council have declared the destructor to be a dangerous structure, and ordered a part of it to be taken down. The contractors deny that there is any danger, and, according to them, the whole trouble has been caused by one of the Kensington officials. The law committee are now considering what steps are next to be taken, and it is not difficult to imagine the character of the report. It is not our business to express a judgment in the case, but it is manifest that whatever may have been the defects, they have assumed an importance through official action which probably was not anticipated when the difference arose.

THERE is one class of men who are likely to suffer through the catastrophe at San Francisco, viz. those belonging to the so-called professions. According to the *American Architect*, Mr. H. E. HUNTINGTON has started a fund by a contribution of 30,000 dols. for the relief of them and their families. As our contemporary remarks:—"The professional man, the lawyer, the doctor, the engineer and the architect is by such a disaster put much more to a disadvantage than the bookkeeper, the clerk and the salesman, since their usefulness depends largely on their having available for immediate use not only the tools of their calling, but also a fair working library; and it is the object of Mr. HUNTINGTON'S thoughtfulness to provide such tools and libraries for those who need them. It is quite immaterial that most of the doctors and lawyers are already exceptionally busy, while the architects and the engineers are certain to have more work to attend to during the next twelve months than, a day before the fire, they could possibly have expected to come to them during the next twelve years. For the moment they are in distress, and as, because of their professional losses, they are unable to give their stricken community the full benefit of their knowledge and skill, it is a happy event that someone has thought to afford them this special relief." It is to be regretted that under such circumstances our Architects' Benevolent Fund or the Artists' Fund cannot come to the aid of their American brothers.

BY-LAW 14 of the by-laws made under Section 39 of the London Public Health Act, 1891, provides that every person who shall intend to construct any water-closet, &c., or to fix in, or in connection with, any water-closet any apparatus or trap or soil-pipe, shall, before executing the work, give notice in writing to the clerk of the sanitary authority. It has been decided—London and South-Western Railway *v.* HILLS—that this notice must be given not only in cases where a new water-closet is being constructed, but also in cases where an old water-closet is being repaired, by doing any of the things enumerated in the by-law. It was argued that this construction would lead to inconvenience, because it would mean that the smallest repair could not be executed without notice to the sanitary authority. The answer to this is that there would be no inconvenience if the term "apparatus" in the by-law is reasonably construed. "I think," said RIDLEY, J., "that expression must be understood as limited to those things which, upon renewal, would, if inefficiently renewed, be liable to render the premises insanitary. Thus, I do not think that a handle or chain pull would be part of the apparatus in that sense. . . . But the renewal of a pan, or trap, or soil-pipe, or ventilation pipe stands on a different footing."

SEISTAN AND ITS RUINS.

PERSIA was so important a kingdom in ancient times and is connected so closely with the rivalries of European history in the future, it now receives unusual attention from explorers. For over sixty years English travellers have been endeavouring to obtain information at personal risk respecting so great a country, which, from being a neighbour of Afghanistan and Baluchistan, has unusual political importance in respect of the Indian Empire. Persia is, however, no less interesting to archæologists. In November 1905 we reviewed a book by Lieutenant OLUFSEN, who was the chief of two expeditions sent all the way from Denmark to obtain, if possible, some information about the old buildings. He was able to give illustrations of some of the remains of architecture in Khiva, Bokhara and Turkestan. In the last number of the *Journal of the Society of Arts* there is a report of an important lecture by Sir ARTHUR HENRY MCMAHON, which deals with another part of Persia, viz. the district of Seistan. Anyone who will look at a map of Persia will see that Seistan projects from the general line of the boundary, and, as it were, intrudes on the southern part of Afghanistan. The great river, the Helmand, of which a branch runs close to Candahar, seems to have its source in Seistan. The district is, in fact, half in Persia and half in Afghanistan, and parts of it are of great fertility.

This out-of-the-way land, which might seem to be interesting mainly for political considerations, and which on some maps is shown as no more than a colossal swamp, is remarkable for its remains. As Sir ARTHUR MCMAHON says:—"Everywhere in Seistan, except on the higher gravel-covered terraces, we find ruins. No country in the world contains so many. Everywhere one looks are ruins stretching away as far as the eye can see. The number, magnitude and nature of these ruins testify to a time when Seistan was far more populous, prosperous and civilised than it is to-day." Indeed, he believes that Seistan was the birthplace of Persian history and romance.

The semi-mythological warrior known as SAM or SAHM was the hereditary chief of Seistan, and he gave his allegiance at a most critical period to MINOUTCHEHR, who was the son of FERIDOON, a king who was described by one of the Persian poets as glorious although he was not an angel nor made of musk and amber. SAHM's son ZAL-ZER was also a hero and warrior, and his grandson RUSTAM was during four reigns the greatest warrior in all Persia. The legends of which he is the hero form a main part of Persian literature. RUSTAM's adventures were made the subject of a poem by FIRDOUSI (*i.e.* Paradise), the poet, who died in 1020. The work was translated and brought out in the finest style by order of the French Government in 1848. One of the incidents was treated by MATTHEW ARNOLD in his "Rustem and Sohrab," and FIRDOUSI's work has been made available for students of all lands. In Persia it is said that 300 villages were named after RUSTAM. When Seistan was invaded by TAMARLANE, according to a tradition a voice was heard near the sepulchre of RUSTAM bidding him arise and see how Iran, the land of light, had fallen into the hands of the Turanian. "The Book or Epic of Kings," as the poem is called, mainly relates to the history of Seistan. From it we learn of continual wars and of the return of the victors, when in their honour "all the land was decked in festal garb, and the world resembled cloth of gold, and musk and amber perfumed the air, and jewels were strewn about the streets like unto vile dust." The explorations of Sir ARTHUR MCMAHON compel us to believe that FIRDOUSI's cloud-capped towers, gorgeous palaces and solemn temples were like the men who erected them—made of clay. It would, however, be outside our province to mention even the names of the warriors who arose in Seistan. For centuries the region has been closely connected with Persian history and with the invasion of India from the West. But in course of time it ceased to have any special importance, and was merely recognised as one of the remote districts of the Persian kingdom.

In 1872 the name became known to many Englishmen for the first time. The boundary between Afghanistan and Persia had become defaced. The British Government having been asked to interfere, Sir FREDERICK GOLDSMITH was sent to lay down a line. In 1896, owing to a change in the river Helmand, the boundary disputes were renewed and Sir ARTHUR MCMAHON was sent to fix a boundary line which for 200 miles is marked by massive pillars. In that way he gained opportunities to examine ruins which no European had seen and to make plans and photographs of them. An archæological report is in preparation by Mr. TATE, survey officer to the mission, and when it appears it will contain all the information that was collected.

Like many other Eastern countries, Seistan has no stone quarries. Brick has therefore to be used. It was found that all the ruins had lower courses of baked brick, while sun-dried brick was employed for the upper part. It might be supposed that mud bricks were not likely to endure. But some of the ruins have stood the wear and tear of centuries. In the first place, the walls are very thick, the clay is adapted to make excellent bricks, and the rainfall is on an average only 2 or 3 inches a year. The ruins would be found in more perfect condition if it were not for the wind:—

"The chief enemy of Seistan ruins is the wind, which blows with terrific force and from always the same direction, a little west of north, more or less throughout the year," says Sir A. McMahon. "All the old ruins of Seistan, except the few circular ones, are orientated at exactly the same angle, *i.e.* the angle of the wind. Their long side walls are in the same direction as the wind and their shorter end walls at right angles to it. You will see from the photographs I shall show you how the wind has undercut the ruins, just as water action would do, and how in places the end walls have been entirely blown away, leaving only the side walls standing. In places solitary pinnacles are all that the wind has left of extensive old buildings."

The part which is inhabited is mainly near the river Helmand. At one time there must have been large cities. The ruins of Zahiden, a place which was described by a traveller in A.D. 900, cover several square miles. Near Zahiden was a minaret, of which the part now existing is 76 feet high. Unlike other structures it is made of burnt bricks of very small size. It was erected about the time when the Normans came to England, and it would probably now be in a more perfect condition but for the deliberate efforts which were made to destroy it. In Seistan, as elsewhere, people are indifferent to antiquity. Another ruin, a place called Karkee, is considered by Sir ARTHUR MCMAHON to have been the ancient fire temple of Kan Koi, which was one of the most celebrated of its class. FERGUSSON says that with the ancient Persians, apart from regal state, the fire temple was the only one they used, and examples are difficult to find. Light and darkness were the contending forces of Persian theology, and it was not always considered necessary to exemplify their opposition within the limits of a building.

Long before RUSTAM was a victorious force there were canals which suggest that prehistoric man in Persia was not wanting in intelligence. In what is now a desolate place known as Ramrod, Sir ARTHUR MCMAHON says he discovered numerous mounds covered with black pottery of the kind attributed to the early days of mankind, and which marks, so to speak, the dawn of civilisation. Here, too, on these mounds are traces of a still earlier age in the form of palæolithic stone implements. These old human relics take us in one jump from the two or three thousand years of the RUSTAM age to the many tens of thousands of years of the palæolithic age. All we have to mark the vast intervening ages are the bits of black pottery and the bits of the more recent but still extremely ancient red pottery which are to be found in enormous quantities

Digitized by Google

all over this portion of the Ramrod delta. At Saxotar, which is a wilderness in Eastern Seistan, he found ruins consisting "of an inner fortress or citadel, of circular form, on a mound round which was a town surrounded by fortified walls. Outside that again, and enclosing a large area of ground, is another surrounding line of high fortified walls. Much of this and surrounding ruins are covered by sand."

The fragments of pottery which he found in the ruins are superior to those found elsewhere in Seistan. There were also a large number of seals and intaglios, suggesting that at some remote period the place was of importance. But the influence of the past is without effect on the modern inhabitants. Within sight of these imposing ruins they live in miserable hovels in the form of domed houses formed into a village. However picturesque they may seem to be at a distance, they are really dirty and squalid. Not even in the capital is there any sign of a desire for comfort. According to Sir ARTHUR MCMAHON, no better illustration of the present degeneration of Seistan can be afforded than its capital, Nasratabad, with its broken-down walls, dilapidated gateways and dirty squalid interior. The luxury of the past ages of Seistan, of which we find abundant evidence in the enormous quantities of broken pottery, china and glass strewn over the face of the country, in the beautifully inscribed seals of agate and other stones and in curiously worked copper utensils and ornaments, and so on, appears to have entirely died out. Instead of the beautifully made pottery and china of the past, the Seistani of to-day has only rough pottery of the simplest kind, and very little of that. Glass is unknown, and the empty bottles left on the camping-grounds were keenly fought over as priceless treasures. It is satisfactory to find that, in spite of all the efforts of Russia, Seistan has become an important trading station between India and Persia. The trade road from Quetta which was opened by the Indian Government has had much to do with the increased traffic. Of course, the people are very backward if judged by modern tests, for bartering is carried on as in primitive times, and the cash estimated as in the possession of each inhabitant of Seistan is found to be only 1*s.* 3*d.* In the future Seistan may be of great importance to Great Britain. In the case of a conflict with Russia it would be among the districts immediately attacked. There is at present a railway from Quetta which it is expected will shorten the distance from Persia, and in that way it might happen that Seistan would have strategic value which could be turned to account.

SANDRO BOTTICELLI.

IT was stated in *The Architect* last week that some members of the Liverpool Corporation who visited London were informed that painters were not undertaking important subject pictures because there was no encouragement for such works. Patrons preferred to buy works ascribed to old masters rather than the productions of painters who were living. A striking commentary on the statement was afforded by the sale at CHRISTIE'S on Saturday of paintings by Italian and other masters. For a panel by SANDRO BOTTICELLI 5,000 guineas were given, for a portrait by HOLBEIN 1,250 guineas, and for two more of his portraits 3,000 guineas. No less remarkable was the payment of 2,500 guineas for a portrait by HOPPNER. For a picture which was sold thirty years ago for 91 guineas, and which was supposed to have been painted by TITIAN, 2,100 guineas had to be paid.

In the history of connoisseurship, favourites rise and fall in as mysterious a manner as courtiers in royal palaces. A very few years ago HOPPNER was regarded as no more than an imitator, who owed any success he obtained to the accident that he was by birth a hanger-on of the English Court. In a few years we may expect to find it stated that he had greater variety than ROMNEY, and still higher prices may be given for his pictures.

The case of BOTTICELLI is still more noteworthy. He was unknown to REYNOLDS, and there is no allusion to him in the volume of lectures on painting by some of the early Academicians. His name is not mentioned by WALPOLE. Not one of his pictures was in the collection of CHARLES I., which included examples of all the masters who were prized at the time. There might be some excuse for the English ignorance of the merits of BOTTICELLI. But what is to be said of those who founded foreign galleries? The royal collection at Dresden is known to be one of those in which much discrimination was exercised in the selection of paintings. It was not until 1868 that an example by BOTTICELLI was added, viz. four scenes out of the life of Bishop ZENOBIUS. Another example, a *Madonna*, was obtained in 1874 out of England. Not until 1855 was a picture by the artist secured for the British National Gallery. Numerous histories of Italian art and biographical dictionaries have been published without any reference to BOTTICELLI'S pictures.

A painter who has taken so many years to "discover" could not possess the qualities which strike all the world by their naturalness, vigour, or beauty. Indeed, from what is said by VASARI, we may infer that BOTTICELLI'S pictures were to the Florentines of his own day what caviare is to the general. One of his chief works was supposed to be heretical in principle. It was concealed from view, and the altar for which it was to be an adornment ceased to be used for services. It may therefore be inferred that a great deal of the admiration which his works excite is little more than mere affectation. In GOLDSMITH'S time it would appear that to praise the works of PIETRO PERUGINO was accepted as a sure sign of good taste. The master of RAPHAEL, and of so many other painters, is now considered to be no more than a mere manufacturer of pictures, who understood the principle of the division of labour perfectly, and who posed his figures in such a way that it was a simple matter to transform them so as to meet the special demands of patrons. BOTTICELLI has now taken PERUGINO'S place as an artist whose qualities are, it is assumed, only to be made out by skill and sensitiveness to beauty. Nevertheless, it must be allowed that he, at least, was free from the manufacturing spirit. Like all great masters he had his school, and his pupils were able to copy him so closely that experts find it impossible to distinguish between genuine works and imitations. But that result of admiration and loyalty appears to have been almost unavoidable in the fifteenth century.

It is difficult to class SANDRO BOTTICELLI. As he was born in 1447 and lived until 1510, he was a contemporary of LEONARDO DA VINCI, who lived between 1452 and 1519. The two painters gave most attention to countenances, and both aimed at creating types of women which have something mysterious about them. BOTTICELLI, whose real name was ALESSANDRO FILIPEPI, was the son of a tanner, one of those shrewd Florentine citizens who desired to be able to use his son in business. But reading, writing and accounts did not suit the boy, and in despair the father turned him over to a goldsmith named BOTTICELLO to make something of him. In the workshop he was fascinated with painting, and the father was wise enough to have him transferred to Fra LIPPO LIPPI, whose curious history has been often told. The monk, with all his faults, was able to produce lovely paintings of the Madonna and children, and it was not long before his pupil was competent to rival him. SANDRO'S ambition and sense of innate and acquired power was proved by his daring to paint a figure of St. AUGUSTINE in rivalry to one of St. GEROME which had been painted on an opposite wall by the great GHIRLANDAJO. In the latter reliance was placed on apparatus and books such as are used by the learned, says VASARI. But BOTTICELLI resolved

Digitized by Google

to dispense with such aids and to express the student by the treatment of his face alone. "In the countenance of the saint," writes VASARI, "he has clearly manifested that power of thought and acuteness of perception which is for the most part perceptible in those reflective and studious men who are constantly occupied with the investigation of exalted subjects and the pursuit of abstruse inquiries." Nevertheless, studious saints in their cells or cool hermitages were not the characteristic works of the artist. He delighted to express not only action but the momentary effects of actions. The Pope was able to realise the peculiar fitness of the painter when he summoned him to Rome to paint the walls of the new Sistine Chapel; a work, however, that is rather associated with MICHEL ANGELO than BOTTICELLI. It was arranged that he was to paint such scenes as the history of MOSES, the Temptation of CHRIST, the punishment of KORAH, DATHAN and ABIRAM. In them the artist made use not only of rich colours but of gold, which was a favourite aid to him in the ornamentation of the robes of his figures and for other purposes.

Although according to tradition SANDRO was not a model schoolboy, when he grew up he became attached to classical subjects. At the time there were numerous scholars in Florence who could aid him in such compositions. But the painter could never have succeeded to the extent which his pictures reveal if he had lacked the power of keeping in his mind's eye clearly and definitely the whole *dramatis personæ*. If such a scene as *Calumny*, which is an attempt to suggest a painting of APELLES on the basis of a description by LUCIEN, seems to a modern somewhat bizarre in treatment, it is because, from our acquaintance with statuesque figures in classic subjects, we cannot believe in so much dramatic movement as is represented by BOTTICELLI. He has not only subjected the principal figures to his idea, but made the statues in the niches of the court lose their decorum and take an interest in the trial. Then again, in *The Birth of Venus* we see not only the goddess in her shell, but the Winds which waft her to the land and flowers which seem to fly around the goddess. His weird imagination is less restrained in his illustrations to DANTE, which passed from London to Berlin. It may be that the liberty which he claimed as his right made him appear as an artist apart who had best be left alone in his waywardness.

We can well understand that when the religious revival in which SAVONAROLA was the chief agent took place in Florence how SANDRO BOTTICELLI would be one of the foremost to suffer remorse. The Dominican was particularly severe on all those artists who had utilised classical legends for subjects. BOTTICELLI had a weakness for splendid draperies, and his Madonnas sometimes resemble Eastern princesses. He was, therefore, one of the men whom the orator addressed when he said, "You introduce worldly vanities into the Church. Do you believe that the Blessed Virgin was adorned as you represent her? I tell you that she was modestly dressed, and so veiled that one could scarcely see her face." BOTTICELLI became one of the Piagnoni, or followers of SAVONAROLA, who had renounced worldly vanities, and he was among those artists who made the great sacrifice of burning their own works and their artistic treasures in the great fire in the Piazza dei Signori in 1497. The pile was pyramidal and had fifteen steps, on each of which were deposited objects of different kinds. Below were foreign tapestries, then figures and portraits of the fairest damsels of Florence, then dice, cards, books of music, lutes and other musical instruments, volumes by ancient and modern poets, carnival dresses, ivory and alabaster chessmen (to save which alone a Venetian offered 20,000 crowns), and other vanities. The spectacle was renewed the next year, and in the course of a few months, by one of those reactions which were common in Italian cities, SAVONAROLA himself was reduced to ashes on the very spot where he believed he had exterminated all the aids and appliances of the new paganism.

BOTTICELLI was undoubtedly sincere, more so, indeed, than other artists who thought they had repented. He not only sacrificed such paintings and drawings of his own as he possessed, but he resolved to abandon an art which he believed was a source of temptation to others. The few words of VASARI reveal a condition which was deplorable. "SANDRO," he says, "abandoned all labour, insomuch that, finding himself at length become old, being also very poor, he must have died of hunger had he not been supported by LORENZO DE' MEDICI, for whom he had worked at the small hospital of Volterra and other places, who assisted him while he lived, as did other friends and admirers of his talents." It is also added that before he died he was unable to stand upright and was obliged to go about on crutches. The decrepitude must have taxed the patience of a man who prior to his conversion was joyous, and, like many other artists of the time, addicted to practical jokes. Indeed, in many of his pictures there are incidents which are evidence of the humourist who believed that comedy sometimes encroached on tragedy.

It is curious to find so many works by the painter turning up from time to time, although, as we have said, a century ago his name was almost unknown in England. It is not to be supposed that they were all created for the new market. There was a piquancy about BOTTICELLI'S works which soon after his death made them desired in Italy. VASARI says that for a long time afterwards the artists were eager to collect examples of his drawings. His pupils and followers found it to be more advantageous to produce "tondi" or circular panels of the Madonna and Angels, and to ascribe them to the master, than to invent works of their own. The result is that outside Florence it is difficult to say whether we have a genuine picture before us from the hand of BOTTICELLI. Nor is Florence always able to produce evidence to prove that the examples with his name are not imitations. The *Simonetta* in the Pitti Palace has been compared with the *Mona Lisa* by DA VINCI in the Louvre. The woman is equally mysterious, without being so impudent a sphinx. But later investigators believe that the Pitti portrait is no more than a copy. With such an example before them, English collectors will be wise if they exercise caution before spending thousands of guineas on works ascribed to a master who at one time was imitated without much difficulty.

SOME RECENT LAW ON SEWERS AND DRAINS.*

ALTHOUGH the subject that I have chosen for the paper that I have the honour of reading to-night is one that makes no appeal to the æsthetic sense, yet it is one of practical utility. It has been said that an architect's professional equipment entails the knowledge of many professions and businesses. He must be an artist in his perception of form; a business man in his knowledge of cost and prices; a man of the world in his dealings with his clients; a student of hygiene, and in addition a lawyer in his knowledge of building contracts and sanitary law. It is only on the latter subject that I can venture to address you, and I have chosen a branch of the law to which I have recently had occasion to devote some attention, namely, the law of sewers and drains.

This has been a fascinating study, and since it is one that caused the judicial bench to constantly complain of the draughtsmanship of certain sections of the Public Health Act, 1875, and the Public Health Acts Amendment Act of 1890, in their attempts to define what is and what is not a sewer, and what is and what is not a drain, I think you will agree that the law is not particularly easy. My object to-night is not so much to examine the cases nor to criticise them, but to state results and to tell you what the effect of the recent

* A paper read before the Society of Architects on May 1st, by Arthur P. Poley, Barrister-at-Law.

Digitized by Google

decisions is, so that you can translate them into practice, and, if called upon to intervene in the interesting arguments that occasionally take place between clients and the local authority, as to who is to pay for the repair of the thing, pipe, or conduit, or whatever you like to call it for the purpose of avoiding the term sewer or drain, at any rate you may have a knowledge of the recent cases on sewers and drains. My subject to-night, however, travels beyond the Public Health Act of 1875 and the Amendment Act, for it includes a few decisions on metropolitan sewers and drains. I propose, therefore, to consider these first, and then to pass on to the subject of extra metropolitan sewers and drains, or sewers and drains under the Public Health Act, 1875.

Now, I suppose most people who study the question at all are familiar with Section 250 of the Metropolis Management Act of 1855. It runs:—"It is provided that in the construction of the Act that the word 'drain' shall mean and include any drain of and used for the drainage of one building only, or premises within the same curtilage, and made merely for the purpose of communicating with a cesspool or other like receptacle for drainage, or with a sewer into which the drainage of two or more premises occupied by different persons is conveyed, and shall include any drain for draining any group or block of houses by a combined operation under the order of any vestry or district board [for which we may now read the order of any borough council], and the word 'sewer' shall mean and include sewers and drains of every description except 'drains,' to which the word interpreted as aforesaid applies." Now the drain is to drain one building only, or premises within the same curtilage; if it drains more than one building it is a sewer, and if you can say that on examination of a system of drainage that the drainage drains two buildings, unless there is an order of a vestry or district board in existence, or something else which is not an order, but which judicial ingenuity has said is an order, you may safely say that the so-called drain is a sewer which the local authority are bound to keep in order. I call attention to judicial ingenuity, for I imagine anyone who knows anything of what sanitarians set before themselves in 1855 will know that their ideal was one house one drain; they did not intend that a loose practice should grow up or be sanctioned of combined drainage in respect of new houses, except under special circumstances. If there was to be combined drainage it was to be under proper safeguards, and it was to be made by the order of the vestry or district board.

Now, there were a number of old houses in existence in 1855, where there was already a system of combined drainage, and in respect of these a case of difficulty arose. They were built before the passing of the Act of 1855, and therefore there could be no order of a vestry or district board in respect of them; therefore, by reason of the definition of a sewer as one that drained two or more houses, these drains were sewers. The Legislature said it was never intended that the drains of all these houses should be sewers repairable by the vestry or district board, so we will make that clear by an amendment Act. Accordingly the Act of 1862 was passed, and it declared that the word "drain," in addition to the definition I have already read, should include "any drain for draining a group or block of houses by a combined operation laid or constructed before January 1, 1856, pursuant to the order or direction or with the sanction of the Metropolitan Commissioners of Sewers," who were created under that title in 1848. Therefore, in determining whether a drain draining two or more houses is a sewer, it is material to notice whether the houses were built before 1848; if they were, you may be certain that the so-called drain is a sewer. If between 1848 and 1855, if there is no order or direction or evidence of the sanction of the Commissioners, then you may be also certain that the so-called drain is a sewer. If the drain draining two or more buildings came into existence subsequently to 1855, you must not lightly think that there need be an order of a vestry or district board in existence, as the Act in express words says, "There may be evidence of an order," which the judges have said is just as good as an order.

Now, an "order of a vestry or district board" was a very formal thing, but evidence of an order may be a very slight and informal thing. Thus, for instance, in 1898, in Geen *v.* Newington Vestry, the Divisional Court said that an order was evidenced by the production of the plan book from the surveyor's office, with a note plan viewed by a man named Goatman, who was t' e foreman under the then surveyor, who was called as a witness. There was no minute of the local authority, but the plan had been found in the plan book of the vestry. Under these circumstances the Court thought it was not unreasonable to conclude that the plan had received the requisite sanction, and that the vestry had allowed a combined system of drainage to be constructed. The last case on the subject was one in 1903—High *v.* Billings; there the evidence was that there was a plan book in which an application to drain by combined operation was entered. It was signed as approved by the surveyor, but unfortunately for the local authority they had resolved that the surveyor should be authorised to grant applications for house drainage, and since they had expressly delegated their powers, they could not have been presumed to have exercised them.

In 1904, in Heaver *v.* Fulham Borough Council, Mr. Justice Channell, commenting on the nature of a plan and the order made thereon for combined drainage, said:—"Having regard to the fact that the details as to the way in which the drainage was to be constructed were omitted from the plan, and that no further plan was subsequently submitted to the vestry, it seems to me that the fact that the vestry gave their sanction to a plan for draining two houses in combination, which did not show how the particular drains from each water-closet or sink were to be constructed, in itself amounts to an authority to their surveyor to deal with those matters of detail." I am not expressing a view one way or the other as to whether the learned judge was right or wrong in so holding. I want to sum up the cases as they stand, and I think I can safely recommend any architect called in to advise on the point as to whether a drain is a sewer or not, to examine what the evidence is in the surveyor's office of a metropolitan borough council before he expresses an opinion on the subject as to whether there is an order or not. If there is no note of a surveyor's approval nor a minute of a vestry or district board in existence, as in a case I was called upon to advise, I think we may safely say there is no order, nor is there any evidence of an order, and if the drain drains two or more buildings it is a sewer. The next point to ask is, What is a building? Two houses may constitute one building, a pair of semi-detached villas in fact; this was so decided in Humphrey *v.* Young in 1903.

Another question that sometimes crops up is whether the premises are in the same curtilage. This is a question which largely depends upon the facts. The last case upon this point was Harris and Others *v.* Scourfield, which you will find in the "*Times*' Law Reports," Vol. 26, p. 268, decided in the latter part of 1904.

A practical matter of some difficulty often arises where three or four or more houses are drained by one drain, and by reason of there being no order or evidence of an order in existence, the drain is a sewer. The question is as to whether any part of the sewer is a drain or not. Let me take a case of three adjoining houses, numbered 1, 2 and 3 respectively, No. 1 draining into No. 2, and the joint drainage of 1 and 2 passing into No. 3. Is it a sewer from end to end? The answer is no. A pipe receiving the drainage of more than one building, not being premises within the same curtilage, is a sewer from and below the point where it receives the drainage of more than one such building; above that point it is a drain and not a sewer. In Beckenham District Council *v.* Wood, 1896, 60 J.P. 490, Mr. Justice Cave said:—"The general rule, as I understand it, is that where a drain receives the sewage of two or more houses it is a sewer; where it receives the sewage of one house only it may still remain a drain, though not necessarily, because it may be a sewer, whether it takes the sewage of one house only or no house at all. A main sewer may be laid down by the local authority in a new street where no houses are built, but where it is intended houses shall be built. Subsequently the buildings may be commenced at the lower end of the street, and when the drains of one house are connected with the main sewer the connecting pipes will be drains and not sewers; but the sewer itself will no less continue to be a sewer, although it receives only the drainage of that one house, and consequently a sewer without a drain at all will be a sewer."

There is another matter to which I should like to allude before passing on to sewers and drains outside the Metropolis, and that is the unauthorised connection that builders sometimes make, when the local authorities are careless in their supervision. Now it would be very unfair that a builder who made such an unauthorised connection should turn round and say, when the drains required repairing, "I know this is an unauthorised connection. I admit I made it, but having made it between these two

Digitized by Google

houses I have made a sewer, and you know it is not my business to repair a sewer." He cannot, however, act in this way, for it is a legal maxim that no one can take advantage of his own wrong, and a builder who made such a statement would be told that he would be stopped from raising such a defence. A late case has carried the principle a little further. Heaver *v.* Fulham Borough Council, 1904, 2 K.B. 383, decided that not only can the builder not raise it, but those to whom he has conveyed the property by voluntary conveyance cannot raise it, nor could the builder's executors or administrators; the best advice that one can give to a builder who has made an illegal connection between houses and, in fact, has constructed a sewer, is to get rid of the property as speedily as possible. A purchaser who buys it will be able to take advantage of the builder's wrong, unless he chooses to be too inquisitive and wants to know all about it. As long as he is ignorant he is an innocent purchaser, and this is one of those cases "where ignorance is bliss, 'tis folly to be wise."

I must now turn to the subject of sewers and drains outside the Metropolis, and here it will be found that the recent decisions have been most important. The principal cause of trouble has arisen by reason of Section 19 of the Public Health Acts Amendment Act, 1890, which provides that where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under Section 418 of the Public Health Act, 1875 (relating to complaints as to nuisances from drains) and the local authority may recover any expenses incurred by them in executing any works under the powers conferred on them by that section from the owners of the houses in such shares, and proportions as shall be settled by their surveyor, or (in case of dispute) by a court of summary jurisdiction. For the purposes of this section the expression "drain" includes a "drain used for the drainage of more than one building." Now, what does "private" mean? Well, it has been decided in Thompson *v.* Eccles Corporation, 1904, 2 K.B. 1, that "private" means a drain constructed on private ground, and private is not used by way of contrast to public, a view which had found acceptance with many of the judges; therefore, where two or more houses belonging to different owners are connected with a public sewer by a single drain constructed on private ground, the section applies, that is to say, the machinery of the section can be employed to make the owner of that portion of the land through which the private drain, which is out of repair, runs, put it in repair, or the local authority can do the work themselves in default of the owner and charge him with the costs.

Now, I think we can dismiss any idea as to whether the single private drain is a sewer or not. According to the judgment of Lord Russell, C.J., in Bradford *v.* the Eastbourne Corporation, which the Court of Appeal followed in the case of Thompson *v.* the Eccles Corporation, the private drain is a sewer, and as such vests in the ordinary way in the local authority, but it is divested for the purposes of section 19, and for these purposes only. Now the term "vest" is one with which lawyers are familiar in connection with roads. The surface of a road vests in the local authority, but the soil is the property of the freeholders on each side of the road, and if it should happen that the local authority abandoned the road the surface would revest or belong once more to the freeholders; when this is understood it will be understood that the ordinary obligation of repairing a sewer, which under Section 13 of the Public Health Act, 1875, vests in the local authority, is transferred or divested for a special purpose, and as soon as that purpose is fulfilled the single private drain draining houses belonging to different owners revests in the local authority again. Now, supposing that you discover the following state of things:—A row of twelve houses belonging to one owner, each of the houses in the row draining at the rear into a pipe or conduit, and at a break in the row houses belonging to different owners, still a continuation of the row, also draining into a pipe or conduit in the rear, and a single private drain running at right angles to these pipes or conduits through the break in the row draining the drainage of all the houses into a public sewer. Is the pipe or conduit at the rear of the twelve houses, which would be a sewer by reason of the definition of a sewer, and not within the exception in Section 19 of the Act of 1890, not a sewer because it drains into a single private drain? The Wimbledon Urban Council in the case of Jackson *v.* the Wimbledon Urban Council, 1905, 2 K.B. 27, raised this contention. They said that since the sewage of all the houses ultimately traversed the single private drain, Mr. Jackson, who was the owner of the twelve houses I have given in the illustration, was liable for the non-repair of his pipe or conduit. The Court of Appeal said no. The place to be repaired could not be brought within the definition of a single private drain, merely by reason that sewage which was carried along it passing at some other part of its course through what could be properly called "a single private drain." Lord Justice Mathew said:—"The argument for the District Council is that, assuming that the pipe which carries the drainage of the twelve houses belonging to the plaintiff was a sewer before the passing of the Act of 1890, its nature has been changed, because its drainage passes into what is admittedly a single private drain. I cannot find in the Act an intention to make such a change." There is one remark that I should like to make before passing on to the next case, and that is that I am not sure that Mr. Jackson was right in admitting that the so-called single private drain was a single private drain at all, but he did make the admission, and so we get a statement of the law that such a thing can happen as a sewer discharging into a single private drain.

The next case that I should like to refer to is that of Joseph *v.* the Wood Green Urban District Council, which was decided in August last year, and there the point that Mr. Jackson admitted was contested by Mr. Joseph. There was a common pipe, which ran on private ground behind a row of sixteen houses; six of these houses, belonging to the respondent, Joseph, drained into this so-called private drain or pipe, but the houses did not possess single drains, but were drained in pairs, the drains of each connecting at the rear and thence running into the common pipe, which discharged into the public sewer. Now, after the drains of each pair of houses had connected in the rear, the length of pipe which communicated with the alleged single private drain or pipe was a sewer. So you had six houses draining in pairs by three sewers into the alleged single private drain. Could the alleged single private drain be a single private drain under these circumstances? The Court thought not. In vain was it argued that the case was on all fours with that of Bradford *v.* the Eastbourne Corporation, 1896, 29 Q.B. 205, and Thompson *v.* the Eccles Corporation, 1905, 1 K.B. 110. The Court distinguished it. The Court were of opinion, although the law reports were silent on the matter, that in these cases each house had a separate drain draining into the single private drain. Anyhow, they decided that the alleged single private drain by reason of these three sewers discharging into it was not a single private drain at all, but a sewer. I believe the Wood Green Urban District Council have now a private Act, so that the fight Mr. Joseph fought is one which will not make him a benefactor to others in a like position with himself in Wood Green. Nevertheless, he may be credited with having cleared up another knotty point on this vexed question.

I should like now to pass from section 19 to refer briefly to some cases which are decided on the words of the definition of sewer and drain in the Public Health Act of 1875. Now, the definition of drain is substantially the same as that I have already read in connection with this word under the Metropolis Management Act of 1855; but the word sewer includes sewer or drains of every description, except drains to which the word drain interpreted as aforesaid applies, and except drains vested in or under the control of any authority having the management of roads, and not being a local authority under the Act. In other words, if you have not got a drain within the meaning of the definition of a drain, or a drain vested in or under the control of a road authority, your drain is a sewer, because every drain not within the excepted classes is a sewer. Therefore, if a house drains into a pipe, and the pipe receives the drainage of a field, the pipe from the place of junction is, or should be, a drain which, not coming within the exceptions, is a sewer. A recent case, the Wincanton Rural District Council *v.* Parsons, 1905, 2 K.B. 34, decides the contrary. The case has considerably puzzled me, and with very great respect to the learned judges who decided it I doubt its soundness. Nevertheless, there it is, and architects called in to advise in respect of country houses where a similar state of things exists will do well to make a note of it.

There are so many other interesting questions that I should like to touch upon if time permitted and I were not afraid of wearying your patience. There are the London County Council by-laws and the by-laws of the Metropolitan Borough Councils, the by-laws under the Public Health Act, 1875, all of which I suppose you are more or less

Digitized by Google

familiar with. Occasionally a case on this subject finds its way on appeal from justices or a magistrate to the King's Bench Division, but the construction of these by-laws is not of sufficient general interest to touch upon to-night. There are the questions of responsibility of local authorities in the construction of their works for nuisances; the time when a stream ceases to be a stream by the influx of the drainage of houses, becoming a sewer; sewers made for private profit, and other matters on which there have been more or less late decisions; but I cannot deal with these to-night. In my rapid survey I am aware that I have omitted to deal with many cases which will occur to you; I trust you will pardon me for the omission. I have chosen what I thought would be most useful to you and interesting, and if I have been of the slightest service to any of you I shall feel well satisfied, and shall feel that any little trouble that I have taken has been well repaid.

BEAUTIFYING LIVERPOOL.

IN furtherance of the idea that a society should be formed to promote beauty and dignity in the development of Liverpool a circular letter signed by Mr. Taliesin Rees, hon. secretary *pro tem.*, has been addressed to the Architectural Society, the Medical Society, the Philomathic Society, the Historic Society of Lancashire and Cheshire, the Law Society, the Ruskin Society, the Kyrle Society, Liverpool Academy of Arts, students of School of Art, students of University School of Architecture, Artists' Club, Liver Sketching Club, Press Club and other bodies. In this letter Mr. Rees says:—

In the minds of most citizens of Liverpool a profound impression has been created by the recent devastation of one of the most beautiful districts of Liverpool—the neighbourhood of Aigburth Road—and the opinion has been freely expressed that such vandalism might have been avoided had a better appreciation existed amongst the people generally who compose the citizens of Liverpool of the great value to their health and happiness of beautiful and dignified environment.

The acceptance of such a principle carries with it the consideration of many cognate subjects, such as the control of advertising, the more far-seeing laying-out of streets and open spaces, parks and buildings and the avoidance of architectural development such as would be out of harmony with its surroundings.

For the discussion of these matters, and for the furtherance of the objects in view, it has been proposed at a members' meeting of the Liverpool Architectural Society that a Society should be formed for the promotion of beauty and dignity in the development of our city.

In order to enlist the sympathy of all the citizens of Liverpool, and to enable them to join the Society, it is intended to form a council of management comprised of delegates from all the art, commercial and learned societies, together with prominent citizens of Liverpool—not more than three delegates from each society—and from this body to elect a small executive committee to carry out the policy of the larger council.

The subscription it is intended shall be, say, 1*s.*, or at most 2*s.* 6*d.*, in order to enlist membership of the Society among all classes. This letter is merely tentative, and we should thank you to bring it formally before the notice of your committee for an expression of opinion whether, upon the formation of such a Society, they would be willing to appoint delegates to represent your society.

Following the issue of this circular, with a desire to learn more of the movement and its object, a representative of the *Liverpool Courier* sought Mr. Edmund Rathbone, who is a leading spirit of the new departure, and at the Wayside Café, the meeting-place of these conspirators against ugliness, some information was elicited. Mr. Rathbone said the people of Liverpool and other large towns have long ago demanded and secured certain desirable things, such as a good water-supply, approved drainage, wide roads, open spaces, convenient tramway service and efficient police protection, and we now want the democracy to consider æsthetics as a necessity of city life, and to rouse them up to such a pitch that they will not be happy till they get them.

"Is it a new idea?" "Not at all. It is somewhat new in England as an organised force, although it has, of course, for many years past occupied the attention of men and women who make æsthetics a study. In America and on the Continent it is a question that is kept well to the front. The great mass of the people hate dinginess and ugliness and love colour, and we want to manage, if we can, to remove all drabness and dirt and introduce all the light and colour possible. Look what a crowd follows a band in the street, however bad, and what a turnout of citizens you get to look at a May-day procession. Why? Because of its colour and gaiety. Why should the colour sense be gratified once or twice a year only? Why not have colour about all the time.

"Do we propose enactments to enforce beauty? That would hardly be possible, though if by-laws are necessary let the people, through their representatives, demand such. What we are aiming at is to make every citizen and citizeness a missioner of the beautiful. Let each one, whatever station of life they occupy, keep the beautiful in view in all they do, and if we can only get that mighty inert mass, the public, who can never be roused to a full sense of the power they are able to wield, to say, 'We are citizens of no mean city,' and to feel proud of the place they live in, they will speedily resent any action that will have any marring effect on the beauty of the city which should and will be their pride.

"Have we any outline of programme? Well, the idea is in such embryonic form at present that none has yet been formulated. Lectures will probably be given, and excursions to other towns and villages to see what they have to show for beauty will no doubt be arranged. I think the old rule of everyone sweeping before his own door would be very beneficial in this question of æsthetics. If all men and women did what they could in their own homes it would have a great effect. For instance, it should be considered an offence to poison the atmosphere by emitting unnecessary quantities of smoke, and in many other ways the private householder could greatly assist the idea of the City Beautiful.

"Do I suggest municipal building schemes? No; the private capitalist is the man to be looked to for the City Beautiful. The private builder has given us Port Sunlight and Bournville, and there is no reason why the private capitalists should not find a reasonable investment in attractive city dwellings; and if we can only arouse the people to a sense of the fitness of things, they will refuse to live pent up in mean streets and demand something more artistic and attractive, and the demand will create the supply. For the present we shall have to be content with criticism, oral and written, and the spreading of our propaganda. It will take time—a long time perhaps—to make any visible impression, but if we persevere I have no doubt we shall succeed in banishing ugliness from everything, and converting the one-time black spot on the Mersey into a City Beautiful."

The Pastel Society have elected the following members:—Messrs. A. L. Baldry, Lewis Baumer, Simon Bussy, W. Lee Hankey, Evert Moll and Le Gout-Gérard.

Mr. Henry E. Stilgoe has been selected by the Birmingham public works committee for recommendation to the City Council at their meeting on the 22nd as surveyor to the Corporation, at a salary of 1,250*l.* per annum. There were fifty-three applicants. Mr. Stilgoe is thirty-nine years of age and he has held his present appointment of borough engineer and surveyor at Dover for upwards of eleven years, his salary being equal to 1,000*l.* a year. He served his articles with a firm of railway engineers and for two years was a student at the Crystal Palace School. For six years he was assistant surveyor to the Lewisham Board of Works, and then, after being employed for a short period at Sandgate, he removed to Dover. He has had a large and varied experience in connection with sewage works and also in Parliamentary and arbitration cases.

The West Sussex Education Committee last week considered the appointment of an architect and draughtsman. It had been previously decided to appoint such an official, as it was expected to result in a considerable saving. No fewer that 223 applications were received for the post, and after interviewing three selected candidates the sub-committee recommended the appointment of Mr. Haydn Roberts, of Roath, who was twenty-six years of age, and had been staff architectural assistant to the Glamorgan County Council since June 1904, and was formerly under the London County Council. The salary was 120*l.*, exclusive of expenses. The secretary said they paid 660*l.* in architect's fees, &c., in the first year. The sub-committee's recommendation was adopted.

NOTES AND COMMENTS.

A MEETING of the Chapter of Chichester Cathedral was held on the 10th inst. One of the subjects which engaged attention was that the Arundel screen, which for several years has been temporarily placed in the lower part of the detached bell tower or campanile, should be set up in the north transept, and that Dean HOOK's tomb should be placed beneath it. Some of the old inhabitants of Chichester may be alarmed at the proposal. JOHN ARUNDEL was a very quiet bishop who presided over the see from 1459 to 1478. He had erected a shrine or screen which stood between the western piers of the central tower. Dean CHANDLER, who died in 1859, left 2,000*l.* for the improvement of the choir. It was decided in the first place to remove the Arundel shrine, which helped to separate the nave from the choir. In the course of the operations it was discovered that the screen must have helped to buttress the piers, which, like those of some churches, consisted of a casing of ashlar to a core of rubble. It was necessary to adopt measures to preserve the central tower from risk; but the weight was too much for the new masonry, and in February 1861 it became apparent that a catastrophe was impending. It occurred on the 21st, but without any accident either to workmen or to spectators. Professor WILLIS came to the conclusion that owing to the disintegration of the piers no human power could have arrested the fall. Six years afterwards the present tower and spire were completed at a cost of about 60,000*l.* The Arundel screen may have delayed the accident, and it can now be restored to a different position without any apprehension of the consequences.

THE Town Council of Yarmouth have shown an appreciation of their surveyor's services which should be recorded as an example to other corporations. As is evident at the present time in Dundee, the performance of extra services is not recognised as work which in strict equity could be declined. In Yarmouth the borough surveyor prepared the plans and other work required for application to Parliament for approval of the tramways. If the work had been done by an outside engineer the cost would have been at least 1,000*l.* He superintended the construction of 12½ miles of tramway by direct labour. If a private practitioner had been employed the cost would have been about 6,000*l.*, and the contractor's profit would have ranged from 8,000*l.* to 12,000*l.* He was also able to save royalties on an improved rail amounting, say, to 1,100*l.* In return for saving the ratepayers over 15,000*l.* it was proposed to present the borough surveyor with an honorarium of 500*l.* Yet when the subject came up for consideration at the last meeting of the Council two of the members opposed the proposal. Practically, however, the grant of the money was unanimous. If the opposition had succeeded other places might suffer, for borough surveyors might hesitate before they added to their labours, when they remembered that there was a possibility that the saving of a considerable sum brought them no reward. Indeed, it often seems surprising that borough engineers will go beyond the limits of their duty under such circumstances. We suppose the main satisfaction is the demonstration that they possess the power of conducting a Bill through Parliament, and carrying out works, in the expectation that in that way their fitness for office in a larger town will be conclusively shown.

ILLUSTRATIONS.

ROMAN CATHOLIC CHURCH, TONBRIDGE.

WE publish this week a photograph of the interior of the above church, which has now been completed upon a commanding site in Lyons Crescent, Hadlow Road, from the design of Mr. W. BARNSLEY HUGHES, of 31 Craven Street, W.C. An illustration of the exterior appeared in our issue of July 10, 1903. The church is of simple Early English character, dignified and well-balanced. Accommodation is provided for about 350 seats in the nave and sixty in the chapel. There is a triforium above each aisle and a gallery over the narthex, constructed with concrete and steel joists, providing accommodation for some 100 worshippers in case of necessity. The roof construction is simple yet of a pleasing character; the principals are lattice steel-framed and carried down the main walls about 10 feet, filled in with timber in half-circle with moulded timber ribs bolted on, which construction renders the acoustic properties of the building perfect. The building is complete with clergy and choir sacristy at the north angle with crypt beneath provided for heating accommodation, The cloister from presbytery to church is a convenient feature which is of great advantage to the priest in residence.

Structurally, the church is carried out in red brick relieved with Bath and Portland stone. The face-bricks internally were supplied by Mr. G. RICHES, of Cromer, especially selected for their mellow and uniform tone of colour, which, with the black pointing, presents a rich appearance. The bricks for the general construction and external facings were supplied by the Quarry Hill Brick Company, Tonbridge; steel construction by HOMAN & RODGERS, of Gracechurch Street, E.C.; and glazing throughout by WM. MORRIS & Co., Westminster. The altar decoration is by Mr. E. B. LAMB, Craven Street, London. The builders and contractors, to whom the architect is desirous of giving every credit, are Messrs. MARTIN & Co., of Tonbridge; and for beautifying the church in many details kind friends of the congregation are responsible, for which Father WALSH, the priest in residence, expresses gratitude.

---

25 AND 26 BERKELEY SQUARE, W.

THE accompanying illustration shows a perspective view of the front elevation of the above flats now nearing completion, which have been designed to create the impression of a large town house, and not giving any one flat prominence over the others. The building when completed will form, with the palatial block at Hyde Park Place by the same architect—whose design we illustrated in the issue of *The Architect* for January 12, 1906—an important addition to the reconstruction of this part of the Metropolis, as an endeavour has been made in the direction of a distinct advance on the ordinary type of architecture employed for London flats and houses. The front elevation is five storeys high, and is composed of a main projecting centre flanked by two short wings; the windows on the front portion are grouped into three bays, connected at the top by a continuous railing; the whole building surmounted by a rich console, cornice and balustrade. The materials employed for the elevation are brown Portland stone with wrought-iron railings. The contractors are Messrs. MARK PATRICK & SON, and the work has been carried out from the designs and under the superintendence of Mr. FRANK T. VERITY, F.R.I.B.A., 7 Sackville Street, London, W.

CAMBERWELL AND DULWICH.*

ANCIENT and prehistoric London was approached by three entrances—one from the south, another from the east and the third from the west; the fourth outlet, called the Great North Road, was afterwards laid out by the Romans. At the three entrances were afterwards placed three churches, each one dedicated to St. Giles, the patron saint of cripples and the unfortunate. That at the eastern entrance was called St. Giles, Cripplegate, and that at the west entrance was named St. Giles-in-the-Fields, or, as it is now called, St. Giles, Soho; adjacent to each of these churches there were placed hospitals for lepers or cripples. At the third or south entrance into London was situated the church of St. Giles, Camberwell, the three churches thus forming, as it were, a triangle, the symbol of the saint, representing the three cities or bishoprics of London, Westminster and Southwark, our *tria juncta in una*, representing our great Metropolis.

In the volume of the Upper Norwood Athenæum Transactions for 1882 appears a note by our then editor, Mr. Michael Pope, F.S.A., as follows:—"St. Giles is the patron saint of beggars or cripples. In the entrance of many towns in England a church is dedicated to his memory, at which cripples and beggars were wont to solicit alms. Hence St. Giles, Cripplegate, in London, and St. Giles, Camberwell, the word 'camber,' or kimbo, meaning crooked or crippled." These words were repeated from a similar paragraph written by Mr. Pope in *Notes and Queries*. I quite concur with Mr. Pope as to the etymology of the word Camberwell, as to its connection with cripples and some well in this locality, the site of which has, however, been lost. I have made careful inquiry, but cannot find that there ever was a hospital for cripples or beggars near the church at Camberwell similar to those I have just mentioned adjacent to the other two churches of St. Giles. It is quite certain that a church stood here in Saxon times, as it is referred to in Domesday Book.

The extracts from Domesday in reference to Camberwell are as follows:—"The land of Haims the Viscount: in Brixton three hundred. Haims himself holds Camberwell. Norman held it of Edward the Confessor. It was then taxed for twelve hides. Now for six hides and one virgate. There are six carucates of arable land. Two are in demesne, and there are twenty-two villains and seven bordars with six carucates. There is a church, and there are sixty-three acres of meadow. The wood yields sixty swine. In the time of King Edward it was valued at 12*l.*, afterwards at 6*l.*, and now at 14*l.*" The next extract refers to Peckham. "The Bishop of Lisieux holds of Odo, the Bishop of Bayieux, Pecheham, which Alfleda held of Harold in the time of King Edward, when it was included in Patricesy (Battersea). It was assessed then, as at present, at two hides. The arable land is one carucate. There are one villan and three borders, and two acres of meadow. It is valued at thirty shillings, as it was in the time of King Edward, but when received at twenty shillings." William Harnett Blanch, in his "History of Camberwell," says:—"The church was probably built about the seventh century. Camberwell was formerly one manor; soon after the Conquest it was divided, and eventually became several distinct manors. That of Camberwell Buckingham, sometimes called Camberwell and Peckham, which was held of the king in capite, belonged to Robert de Melhent, natural son of King Henry I., first Earl of Gloucester, after the Conquest, to whom it was probably granted by his father."

He it was who supported his sister the Empress Maud or Matilda in her struggle with Stephen for the possession of the Crown of England. The manor passed after his death with his title successively to his son William and to John (son of Henry II.), afterwards King of England, who married Isabella, one of the daughters and co-heirs of William; then to Isabella's second husband Geoffrey de Mandeville; then to Almeric de Evereux, son of Mabel, another co-heir of Earl William; then to Gilbert de Clare, son of Amicia, another of the co-heirs; then to his son Richard and his two immediate descendants, both Gilberts; and next to Hugh, Lord Audley, who married Isabella, sister and heiress of the last Gilbert.

Hugh, Earl of Gloucester, died in 1347, and his daughter and heiress Margaret married Ralph, first Earl of Stafford, who thus became possessed of the manor of Camberwell, and it continued in his family till the attainder of Edward Stafford, Duke of Buckingham, in 1521. It was afterwards granted to John Scott, who had been the Duke's tenant. His grandson Richard left the manor between his five sons. Edgar alienated his share in the year 1586 to Edmund Bowyer, Esq., and it became by inheritance the property of Joseph Windham, Esq., of Earsham House, Suffolk. The other manors were alienated afterwards to the Cock family. Respecting the church, in Bishop Edindon's Register at Winchester is a commission dated 1346 for reconciling Camberwell Church, which had been polluted by bloodshed. In "Lysons's Environs of London," printed and published in 1811, it says "the present structure appears to have been erected towards the beginning of the reign of King Henry VIII., and it is very probable that the north aisle was built in 1520, having had that date in each window." In the east window of the north aisle were several portraits of the Muschamp family, dated 1520; a branch of this family came over with William I., commonly called the Conqueror, who being settled at Peckham, their burial-place was in this aisle, where Lysons says there was still a monument erected to one of the family. On this monument was the following inscription:—

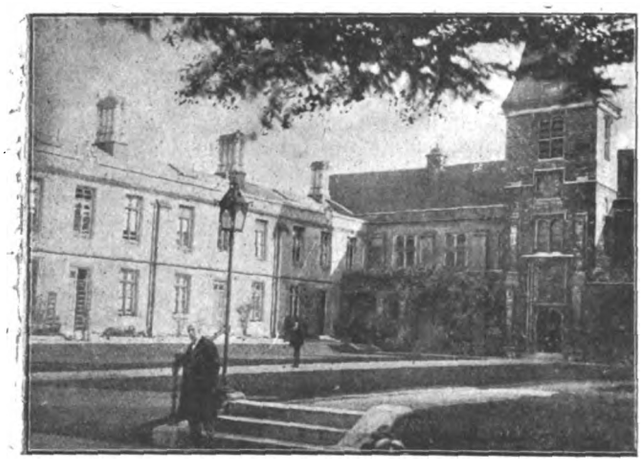
Lo! Muschas stock a fruitfull braunch did bringe
Adornde with vertues fit for ladies brighte
Sir Thomas Hunt on May day's pleasaunt spring
Possest the Frowe that was his soul's delight.
His lovely Jane had two sons by Thomas Grimes, Esq.,
and daughters three
With wealth and vertues meet for their degree,
With twice seven years, six months, ten days were spent
In wedlock bands and loyall love's delight,
November 12th daye then she was content
This world to leave and to give to God his right,
Her sixty-three years full complete and ended,
Her soul to God, to earth her corps commended.
1604.

In the reign of James I. a free grammar school was founded in this parish by the vicar, the Rev. Edward Wilson, and endowed with 7 acres of land. Old St. Giles Church was burnt down on Sunday night, February 7, 1841. The new church was soon afterwards commenced from designs by the architects, Sir George Gilbert Scott, R.A., and Mr. William Moffat, his then partner; it is a very handsome structure, and is one of the largest built in England since the Reformation. It was consecrated November 21, 1844. A very good illustration of it appears in *The Architect*, August 4, 1893. A number of the brasses in the old church have been preserved and fixed in the choir of the present one. Some illustrations of these will be found in Blanch's "History of Camberwell." A handsome chalice cup dated 1597 is preserved and is illustrated in the fourteenth volume of the "Surrey Archæological Transactions," with a description by the Rev. T. S. Cooper, F.S.A., as follows:—"This is a graceful, well proportioned vessel, and very characteristic of its period, with V-shaped bowl and baluster stem. On the bowl and upper part of the foot are incised representations of drops of blood apparently. Two shaped discs divide the stem, and there is a band of egg and tongue moulding on the foot, a band of somewhat similar work appearing round the collar in which the bowl is set."

Dulwich.

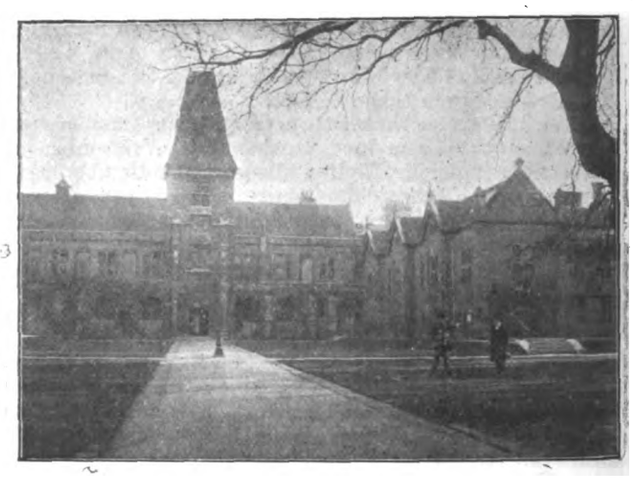
Lysons says the first mention of Dulwich is in the year 1127, when the manor was given by King Henry I. to Bermondsey Abbey. At the suppression of the monasteries it was given to Thomas Calton, and in 1606 was alienated to Edward Alleyn, Esq., and by him afterwards given to the college which he founded at Dulwich. He styled it "the College of God's Gift," and it was founded in 1619. He was a well-known actor at that time and friend of Shakespeare and Ben Jonson, and was the proprietor of the Fortune Theatre in Cripplegate and the Rose on Bankside. He was born September 1, 1566, in the parish of St. Botolph, Bishopsgate, and was the grandson of Thomas Alleyn, of Willen, Buckinghamshire, and of Mesham, Bedfordshire. Edward Alleyn, the second son of the said Thomas Alleyn, and the father of the founder of Dulwich College, was an innholder, and kept the Pye, in Bishopsgate. He had two other sons, John and William. Their mother was Margaret, daughter of John Townley, Esq., of Towneley, in Lancashire. In "Fuller's Worthies" we learn that Mrs. Alleyn was married a second time to an actor of the name of Brown, and it is owing to this circumstance, doubtless, that young Alleyn was bred a stage-player. That he attained great success as an actor at that time beyond all others cannot be disputed, as Fuller describes him as "the Roscius of our age, so acting to the life that he makes any

* A paper by Mr. W. F. Potter, architect, read at a meeting of the Upper Norwood Athenæum on March 24.



Digitized by Google

part (especially a majestic one) to become him." Rare Ben Jonson is also very emphatic in his praises of Edward Alleyn. The earliest record that we have of his connection with the stage is January 3, 1589, when he bought for 37*l.* 10*s.* the share of "playing apparels, play-books, instruments and other commodities." In 1592 he appears to have taken front rank in his profession, as in a piece which came out at that time he is twice mentioned as a performer of deserved distinction.



Edward Alleyn was married to Joan Woodward on October 22, 1592. She was the daughter of the wife of Philip Henslowe, who had married Agnes Woodward, a widow. It is not improbable that Alleyn's wife possessed property in her own right, as four years after his marriage he entered into an agreement whereby he was to receive "4,000*l.* of lawful money of England" for the lease of the parsonage of Firle, in Sussex, a county with which his wife's father had been connected. Immediately after his marriage he appears to have taken up his residence on Bankside, in the Liberty of the Clink, in St. Saviour's parish, near to the Hope, Globe and Rose theatres. Henslowe had become connected with the Bankside theatres shortly before Alleyn's marriage; and about the time this took place a partnership in theatrical concerns was concluded between Henslowe and Alleyn, and they afterwards became jointly interested in the theatres of the Rose on Bankside and the Fortune in Cripplegate. Alleyn's theatrical career received a sudden shock in the Metropolis in 1593, when the plague broke out in London, and he and his company started on a strolling trip through the country. His wife remained with her mother and sister at the

August 1, 1593, preserved in Dulwich College and printed *in extenso* in Harnett Blanch's "History of Camberwell." In 1599 Alleyn's name appears in documents now at Dulwich in connection with the Fortune Theatre in Cripplegate, the establishment of which seems to have proved a source of great profit to its proprietor. The "dangerous decaye" of his Bankside theatre, the Rose, is alleged as the reason of the application to the magistrates for the new house, and great support in his new venture was derived by Alleyn from the parochial powers of that time. In addition to the theatres Alleyn was proprietor also of a bear-garden on the Bankside, and in Stone's "Chronicle," March 1604, mention is made of an exhibition before King James in the Tower, when Alleyn was sent for to bring his dogs from the bear-garden to bait a lion in his den; and at a City pageant on March 15, 1604, in honour of King James's visit, Alleyn, attired as Genius, delivered a congratulatory address to His Majesty. Bear-baiting, on the whole, appears to have been a profitable business with Edward Alleyn, though in a petition to King James subsequent to his appointment as "chief master, ruler and overseer of all and singular his majestie's games of bears and bulls and mastive dogs and mastive bitches," he makes an application for increased salary on the ground that "free liberty to bait bears on the Sunday afternoon, which was the chiefest means and benefit to the place," had been withdrawn by the king.

Among Alleyn's papers is an engagement signed by several persons in Manchester wherein they promise to send up yearly "a masty dogge or bytche to the bear-garden between midsomer and michaelmasse." Other places also entered into similar arrangements. In a

Old Dulwich College.

Old Dulwich College, Front View.

Bankside, when the following letter (preserved at Dulwich College) was written by him during his travels abroad :—

"To E. Alline, on the bankside.

"My good sweete harte and loving mouse, I send the a thousand comendations, wishing thee as well may be, and hoping thou art in good helth, with my father, mother, and sister. I have no newes to send thee, but I thank God we ar all well, and in helth, which I pray God to continew with us in the contry, and with you in London.

"But mouse, I littell thought to hear that which I now hear by you, for it is well knowne, they say, that you wear by my lord maiors officer mad to rid in a cart, you and all your felowes, which I ame sorry to hear; but you may thank your ij supporters, your stronge leges, I mene, that would nott cary you away, but lett you fall into the hands of such Tarmagants. But, mouse, when I com hom, I'll be revenged on em: tell when, mouse, I bid thee fayerwell. I prethee send me word how thou doste, and do my harty comendations to my father, mother and sister, and to thy own self, and so swett harte, the lord bless thee. From Chellmsford, the 2 of Maye 1593.

"thyn ever, and nobodies els, by god of heaven

"Edward Alleyn.

"Farewell mecho mousin, and mouse,
and farewell bess dodipoll."

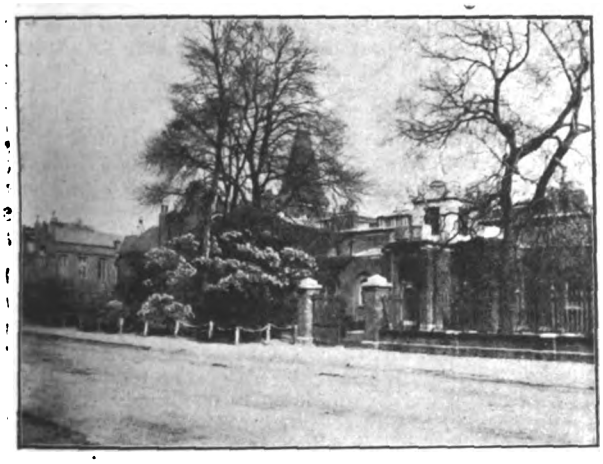
Harnett Blanch says, "Dr. Dodipoll was a character in a play of that time, and hence perhaps the nickname."

There is also another letter, written from Bristol

bond jointly given by himself and Henslowe, dated October 1606, Alleyn is styled "Lord of the Manor of Dulwich." An unexecuted deed of sale of the manor from Sir Francis Calton to Alleyn is preserved in the college, dated June 2, 1606. On August 4, 1607, he added to his property at Dulwich by buying for 410*l.* 10*s.* three tenements and twenty-two acres of land, copyhold of the manor of Dulwich, and four acres and one rood of freehold ground from Ellis Parry, "citizen and weaver," and subsequent additions made in the course of the next five years increased his landed property to about 1,300 acres. In 1610 Alleyn was appointed churchwarden of the Liberty of the Clink. He was assisted in his parochial duties by a most active and vigilant sidesman or synodsman, John Lee, whose "presentments" concerning the wickedness of the locality are to be found amongst Alleyn's papers. The story told by Aubrey of Alleyn becoming much frightened into becoming a public benefactor through seeing the apparition of the devil, when acting that character himself, is of course ludicrous and absurd. By letters patent dated June 21, 1619, license was granted to Edward Alleyn to found a college at Dulwich, to endure for ever, and to consist of one master, one warden, four fellows, six poor brethren, six poor sisters and twelve poor scholars, to be maintained, educated and governed according to such ordinances and statutes as he should make in his lifetime, or as the persons nominated by him should make after his death. The college was to be called the College of God's Gift, and the above-mentioned officers were to be the body corporate, and to have power to take to them and their successors the

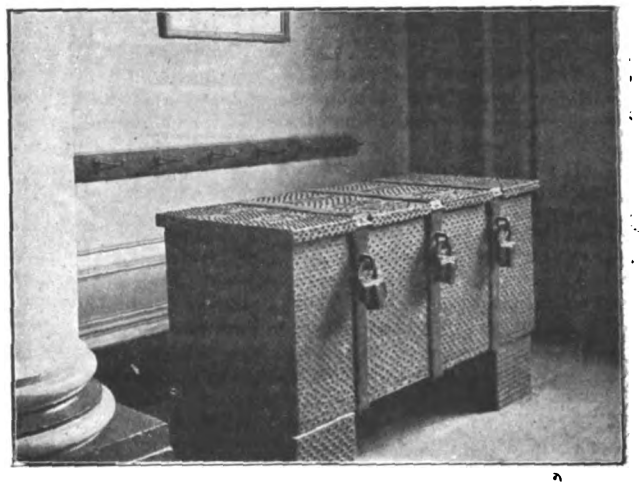
Digitized by Google

lands therein named, and the Archbishop of Canterbury was to be for ever visitor of the college and to have power over the same and the persons therein, to visit, order and punish according to the ecclesiastical law of England or such constitutions and ordinances as Alleyn should make.



In pursuance of this license, the college was formally opened on September 13, 1619, and the various members, as above described, were legally installed in their several places. This date (September 13, 1619) has accordingly been regarded ever since as the date of the foundation of the college. Early in 1613 he had settled the plan of his college buildings, and concluded the contract for their erection. Three years later the buildings were apparently completed, and on September 1, 1616, the chapel of the college was consecrated by the Archbishop of Canterbury. Among those who attended on that occasion were Sir Edmond Bowyer, of Camberwell, and Sir Thomas Grymes. By a deed dated April 24, 1620, Alleyn conveyed the lands mentioned in the letters patent to the sole and only use of the body corporate of his college and their successors for ever. In the year 1643 an order came from King Charles I. commanding them to elect John Alleyn master, by which the rights of the college were not only invaded as to the election of their own members, but the founder's intention expressly counteracted, as by the statutes and ordinances it was ordered that the warden should succeed to the place of master whenever a vacancy occurred. During the Civil War the same dispensing power was exercised by the House of Commons, who appointed two persons to fill up the four fellowships which happened at that time to be vacant. In 1647, Fairfax's army being then at Putney and Fulham, a company of soldiers, under the command of Captain Atkinson, was quartered in the college, for which the sum of 19*s.* 8*d.* was paid, a poor recompense for the outrages which they are alleged to have committed. In 1655 the college presented a petition setting forth their grievances, and praying that the privilege of electing their own fellows might be restored.

Oliver Cromwell, by letters patent dated February 11, 1656, appointed Nathaniel Fiennes, one of the commissioners of the Great Seal, Sir Bulstrode Whitelock, Chief Justice St. John, General Lambert and other commissioners, with full powers to visit and settle the affairs of the college. The visitation took place March 19, 1658, but the commission appointed a new preacher and schoolmaster themselves instead of restoring the privilege of election to the college. The next year Elias Alleyn presented a petition to Richard Cromwell, then Protector, in which he complained that notwithstanding the visitation of the commissioners in the preceding year, the abuses of the college were not reformed. In consequence of this petition certain persons were appointed to inquire into the matter, and it came to a hearing at Whitehall, when it was alleged that the master and warden had alienated lands belonging to the college, and had to the amount of 200*l.* a year applied the money to their own use; that they had sold divers valuable goods belonging to the college, and had aided and abetted the late king by conniving at the fellows being in arms against the Parliament. A report was afterwards drawn up, but nothing further was done.

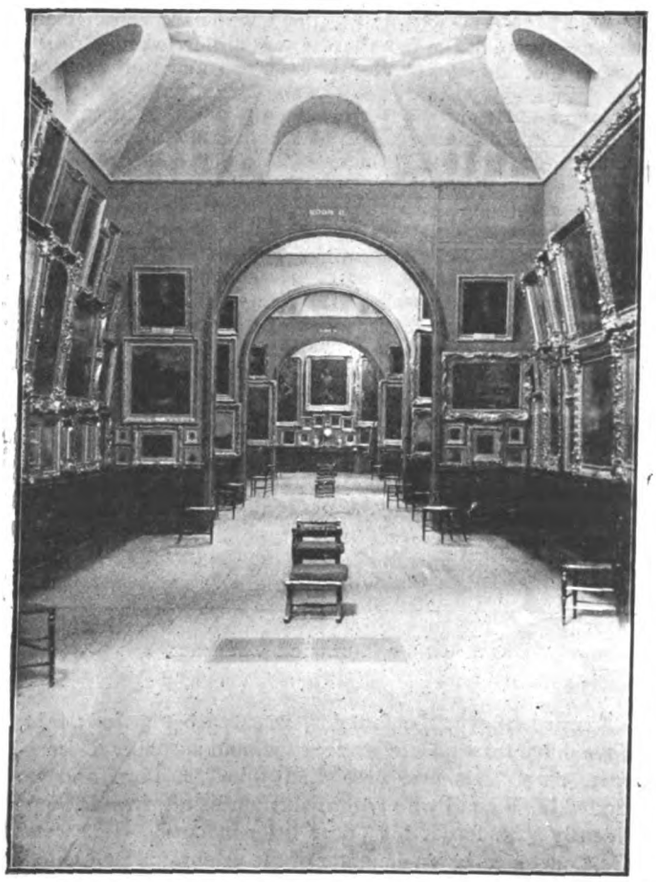


As far as the college was concerned, the Restoration of monarchy soon afterwards led only to further arbitrary interference. A vacancy occurring in 1669, King Charles II. sent a mandamus for the appointment of a particular candidate as warden. The collegiates and assistants, willing to cover their own obsequiousness under the appearance of respect for the law, came to the following resolution :—

"That the Founder was not empowered to make any statutes repugnant to the prerogative royal."

They therefore elected John Alleyn, the Court candidate; but shortly afterwards another letter was received from the Court, informing the authorities that His Majesty had been imposed upon, the candidate he had wished them to appoint having concealed the fact that he was a married man. But unfortunately he had already been appointed, and therefore it may readily be imagined that consternation and alarm reigned supreme at the college, for by obeying the wishes of royalty and neglecting the orders and statutes of the founder, the little corporation at Dulwich had brought themselves on to the horns of a dilemma. Many and long were the deliberations, angry and deep were the mutual reproaches. They had foolishly made a precedent for royal interference, and they were deeply committed to its use. Unless a stand were made the college appointments would in future be issued from Whitehall; and so the little band plucked up courage to check the royal interference. But what was to be done with John Alleyn, who had been elected warden in spite of the fact that he was a married man? In the midst of the deliberations which ensued the wife of John Alleyn died, and this solved the difficulty.

DULWICH COLLEGE MAUSOLEUM.



OAK CHEST, DULWICH COLLEGE.

Edward Alleyn, the founder, was twice married; first, as we have learnt, October 22, 1592, and secondly December 3, 1623. His first wife died June 28, 1623, and he married his second wife within six months afterwards, so he evidently soon forgot his "dear little mouse." His second wife, Constance, was a daughter of the celebrated Dr. Donne, dean of St. Paul's, London. Sir Thomas Grimes, of Camberwell, acted the part of mutual friend in bringing about the second marriage, and the negotiations savour very much of pounds, shillings and pence. Dr. Donne was not liberally inclined to his daughter after marriage, and Alleyn's remonstrance could hardly have been relished by his reverend father-in-law. Alleyn, however, acted well his part, as indeed he acted every part in life, and in his will (dated November 13, 1626) he not only bequeathed to his wife all he had promised, but more also. His second marriage is thus recorded in the register of Camberwell old church :—"Married, December 3, 1623, Edward Alleyn, Esq., to Mrs. Constance Donn." Dr. Donne was a frequent visitor at Dulwich during Alleyn's first marriage, and on May 23, 1620, the doctor preached at Dulwich College, as on that day Alleyn made the following entry :—"Mr. Donne preached here." On the following July 20 this entry occurs :—"I herd Mr. Donne at Camb(erwell), and after dined with Sir Thomas Grimes. They and Mr. Angell came to Dull. in the afternoon." Edward Alleyn died in November 1626, and he was buried in the chapel of his college on November 27, 1626. For further particulars of

Digitized by Google

the life of this remarkable man I would refer you to William Harnett Blanch's "History of Camberwell."

The old buildings of Dulwich College were used until 1870, when the new college was built from designs by Mr. Charles Barry. The picture gallery was erected from designs by Sir John Soane in 1817, to contain the collection of pictures purchased by Noel Joseph Desenfans for King Stanislaus, to form a national gallery for Poland, but they never left this country, and were bequeathed by Desenfans to his friend Sir Francis Bourgeois, R.A., who afterwards left them by will to Dulwich College. As. Mr. Spiers has told you, the pictures contain many fine examples of the Spanish, Dutch and Flemish schools. Among the artists represented are Rubens, Vandyke, Rembrandt, Murillo, Velasquez, Cuyp, Teniers, Titian, Holbein, Raphael, Hobbema, Wouvermans, Berghem, Both, Pynaker, Watteau, Guido, Claude, G. Poussin, N. Poussin, Ostade, Claude Vernet, Veronese, and many others. All these paintings are originals by the artists named, but there are a great number of very excellent duplicates of works by eminent masters. There are also many works of our own native artists, particularly Sir Joshua Reynolds, Gainsborough, Sir Thomas Lawrence, Opie, R.A., Sir Francis Bourgeois, R.A., Northcote, R.A., Briggs, R.A., Cope, R.A., Greenhill, Owen, R.A., J. Wood and R. Wilson,

Interior of Picture Gallery, Dulwich College.

R.A. All the works of these masters are fully described in an excellent catalogue of the pictures, published and to be obtained at Dulwich College. In this book there is also given biographical notices of each of the artists whose works are exhibited here. There are also a number of other paintings by artists whose names are unknown. Among them are a fine portrait of Stanislaus, the last king of Poland, for whom this collection was originally made; a portrait of Edward Alleyn, founder of this college; also one of Joan Alleyn, his first wife; of Sir Francis Bourgeois, R.A., of Noel Desenfans, and of William Tell. I should like, however, to draw attention to a portrait of Henry, Prince of Wales, eldest son of James I This appears to be a painting which the authors of the catalogue do not know much about. This prince was educated at Charlton House, near Woolwich, Kent, under Sir Adam Newton, and the portrait was described in my paper and published in the Upper Norwood Athenæum Transactions on the occasion of our visit to Charlton-on-Thames, September 2, 1893. Isaac D'Israeli, in his "Curiosities of Literature," thus speaks of this prince:—"Prince Henry, the son of James I., whose premature death was lamented by the people as well as by poets and historians, unquestionably would have proved an heroic and military character. Had he ascended the throne, the whole face of our history might have been changed, the days of Agincourt and Crecy have been revived, and Henry IX. have rivalled Henry V. It is remarkable that Prince Henry resembled that monarch in his features, as Ben Jonson has truly recorded, though in a complimentary verse, and as we may see by his picture among the ancient English ones at Dulwich College. Merlin, in a masque by Jonson, addresses Prince Henry:—

> Yet rests that other thunderbolt of war,
> Harry the Fifth: to whom in face you are
> As like, as fate would have you as in worth.

A youth who perished in his eighteenth year has furnished the subject of a volume by Dr. Birch, which even the deficient animation of its writer has not deprived of attractions."

In conclusion, I would mention that Camberwell and Dulwich are situated in the hundred of Brixton; this is a very large hundred, and extends from Wimbledon to Bermondsey, and took its name, Brixistan, or Brixi's Town, from an ancient Saxon family of the name of Brixi, who resided at Hatcham Manor, in this parish, as recorded in Domesday Book. Several places in England took their names from this family, such as Brixham, Brixton and Brixworth. They were probably merchants who had been created thanes by Alfred the Great, who conferred that dignity on all merchants who owned vessels or ships and had completed three voyages abroad, the object being to create the formation of a navy in order to keep off Danish and other invaders by meeting them on their own element—the sea. The Brixies disappeared after the Battle of Hastings, having probably shared the same fate as their superior lord, the brave but unfortunate King Harold.

The illustrations are from photographs taken by Mr. H. S. Mendelssohn, 14 Pembridge Crescent, Bayswater.

DURHAM CATHEDRAL.

THE annual meeting of the Durham and Northumberland Architectural and Archæological Society was held on the 9th inst. in Bishop Cosin's Library, Durham. Rev. W. Greenwell presided. After the transaction of business and selection of places to be visited during the coming season, the President, according to the *Durham Advertiser*, delivered the following address:—He said that with regard to the cathedral nothing had been discovered since the last meeting, but he would like to again refer to the Galilee, which was, he would not say degraded—he would not use such a strong term as that—but he would say most shamefully misused by the University using it for their morning prayers. The whole effect of the building was simply destroyed by the seats there. The Galilee could not be seen unless they happened to be present when the seats were taken out for the purpose of cleaning, and then they saw what an extraordinary building it was, full of grace and beauty. It suffered materially by this stupid use of it. He had protested over and over again. Why the University had it he did not know. Why could they not meet in the nave of the cathedral? There were plenty of seats there, and they could have morning prayers there and let the Galilee be cleared out. It was no use, he knew, if they (the University) went on in their stupid, pig-headed, ignorant, tasteless way, for how many years to come he could not tell. Then as to the castle. The Norman Gallery, which was above the hall of Bishop Pudsey, showed signs of coming away. The south wall was very much out of the plumb, and manifested very considerable danger of coming down. In fact, it would have come down but for the buttressing that was called the Tunstall Gallery, the gallery which runs along the whole length of it, acting as buttress, and keeping it from coming down. That had been now, he believed, made perfectly safe, but it was only safe from falling down. Some day or other, as sure as they were sitting there, it would be all burned down. It was filled now with students' rooms. He had mentioned this over and over again, and he was accused of charging students with being worse than ordinary people. Every person who lived in a house, and who had got lamps, gas, fires, and so on, was liable to set fire to the building in

Digitized by Google

which he lived. It seemed to him to be rather a foolish thing to run the risk of burning down the whole castle, because if the Norman Gallery got on fire no place would be safe; it was connected with the great hall by a staircase, and practically the whole castle would be burned down. He had known himself two fires in the castle, both caused by the carelessness of students. Fortunately both of these took place in a part of the castle which was cut off from the rest of the building by a very thick party wall, so that although every bit of that part of the castle was gutted, it did not make much matter, because it was not of a very early period or of very much interest. It was absolutely, entirely gutted, and but for this thick wall between it and the rest of the castle, the whole of the building would have been burned down. There was no party wall between the Norman Gallery and the rest of the castle. Instead, there was a staircase made of deal, and of a most inflammable character, which would carry fire into the great hall, and so the whole castle would be burned down. Why did the University not use some of the other buildings they have in connection with the castle? There was a place called Cosin's Hall. There were only about ten sets of rooms, if so many, in the Norman Gallery. Why could they not remove these virtuous and harmless people to Cosin's Hall, where, if they burned the place down no harm would come? He must not say more than that, because he got himself into hot water by suggesting that motorists should be shot, and he should not like to suggest that students should be burned. He would like to draw attention to the monument which had been put up in the cathedral churchyard in memory of the officers and men of the Durham Light Infantry who fell in the late war in South Africa. It had been done by a member of the Society, to whom they were indebted for great and valuable help—Mr. Hodges. It was a monument which he thought did very great credit to Mr. Hodges. It was a very striking design, and its outline and proportions and the detail really made it a monument on which they looked with pleasure and gratification. Of course, it did not pretend to be an original design or anything of the kind, because it was based on earlier pre-Conquest crosses of which they had so many remains scattered in various parts; but still it had varied from them to a certain extent. It had been adapted to the present requirements of such a monument, and he thought if they looked at it they would admit it was a very striking piece of work, and really one that they might admire. It was curious that something should occur when that was erected. It was erected on a piece of ground which runs at the west side of the churchyard, a terrace which was made when the cathedral churchyard was levelled about eighty years ago. It was at that time very irregular of outline, and the material which was over and above what was required for the levelling of the churchyard in general was taken to this particular place and constituted a terrace. It was found necessary to cut through that to get a foundation, and when that was gone through it was necessary to go still lower to get a foundation of rock, which was known to be not many feet below the surface. When they came between the old surface of the churchyard and the rock below they found a large number of burials of a very peculiar nature. To what period they could be attributed he really could not say, but he should think that they were probably there before the time of the Conquest. They were Christian burials, because they were all buried east and west, and they were enclosed in slabs of stone each side, and there were two tiers one above the other. They were most remarkable burials, and he did not think he ever saw anything like it. There were twenty-four of these found, and no doubt the burials extended the whole length of the terrace, because they were seen extending on all sides outside of the excavations. There was nothing found with any of them except one, and that was a shell, common to our coasts here, about the size of four cockles, with two holes perforated. What that was intended to be used as he could not tell. They did not expect to find in Christian times anything buried with the dead, because since Christianity was introduced into England there was an Act passed to prevent the old custom of burying articles with the dead. There were men, women and children. It was a very curious thing when they came to find a number of people buried together; people always jumped to the conclusion that there had been a battle. It was no use pointing out to them that there were men, women and children. He had heard of women going out to battle, in the case of the Amazons, but never children; but still they could not drive it out of people's heads, as they could not drive out a great many things. They knew if a lie got a day in advance they could never overtake it, and so it was with ridiculous notions. They could not drive them out, and they would go on jumping to the conclusion that these interments represented battles. Dr. Greenwell then proceeded to talk of what he described as the object nearest his heart—his beloved ancient Britons. He regarded all the rest of the world as nothing compared with them, he said. He proceeded to discourse at length upon this subject, dealing with theories regarding the age of the world. He pointed out that man, no doubt, passed through a process of development from previous lower forms of life. After dealing interestingly with the Stone Age, Dr. Greenwell went on to speak of the appearance in Britain of a people from across the sea, probably from South Germany, who overpowered the people of the Stone Age, partly by their natural strength and partly by being armed with more efficient weapons. Having conquered the people of the Stone period, they lived alongside them, and when the Romans came they found a people in occupation who were using iron. There was nothing to exceed the beautiful things made by those early Iron people and the people of the Bronze period. He had seen most beautiful jet buttons of the period as well manufactured as they could be at the present day, covered with very graceful ornamentation, and he had seen buttons plated with gold and copper with beautiful ornamentation. The people of the Bronze Age, who were superseded by the people of the Iron period about three centuries before Christ in England, and who again were conquered by the Romans, were a people to all intents and purposes as well clothed as we are to-day. He did not say they had trousers, and the habitations were not so comfortable, but they were not painted savages, but people who had reached a very high pitch of civilisation, and no doubt would, if left to themselves, have developed as high a civilisation as Rome had when she conquered Britain. They were conquered to a large extent because they were divided. Cæsar did not conquer them. He tried, but left the country again on finding it too hard a nut to crack. It was only about sixty years after Christ that England was really conquered, and it was conquered principally because the people of the country were divided and did not act under one general rule. They were divided into tribes, and one tribe against another. But for that, if they had developed one general system of government in England, they would never have been conquered by Rome; whether they would have been better or worse he could not tell.

At the close Dr. Greenwell was heartily thanked for his address.

THE LATE EDWARD SALOMONS.

ANOTHER able architect has passed away. Mr. Edward Salomons died on Saturday at Ireton Bank, Platt Lane, Rusholme.

Edward Salomons, says the *Manchester Guardian*, was born in 1828, and thus had a long career. Few Manchester-bred architects have approached him in ability, and few have had his chances of success. He was born in London, but his father, the late H. M. Salomons, had long carried on business in Manchester, and he himself was educated here. The pupil of J. E. Gregan, whose work in Heywood's Bank, St. Ann Street, is admirable of its kind, he had as good an architectural education as was then to be had. He began independent practice when he was about twenty-four, after working for a time for Messrs. Bowman & Crowther, whose strongly ecclesiastical style has not reappeared in Edward Salomon's own work. During his time in the office Messrs. Bowman & Crowther published "Churches of the Middle Ages" and many of the illustrations were drawn and lithographed by him. The Art Treasures Exhibition building of 1857 was his design, chosen in competition. A large block of warehouses in Portland Street is also his; but among warehouses Mr. Salomons chiefly prided himself on that for Messrs. Daniel Lee & Co. in Fountain Street—so bold and striking a building that it was a bitter disappointment to its author that it did not bring him fame and the rush of employment that follows fame. The Manchester and Salford Savings Bank in Booth Street is his, and also the Prince's Theatre in Manchester and in Liverpool the Alexandra Theatre, now a music-hall. The Reform Club, Manchester, which he designed, though a very important building, cannot be regarded as a very great architectural achievement. Mr. Salomons built Messrs. Agnew's art

Digitized by Google

galleries in London and in Liverpool. He built a synagogue and a hospital at St. Annes. He erected a house for Mr. Simon at Didsbury and a house for Mr. Henry Galloway at Urmston. Two or three picturesque houses on the east side of Victoria Park are credited to him, in two of which at different times he lived. He built other houses in Cheshire, in the South of England and abroad. He had an artist's hand as well as an artist's brain. His water-colour drawings of picturesque streets and buildings in England, Normandy, Brittany and elsewhere are pleasant and attractive, though of no great technical merit; many of them have been exhibited in Manchester. With such an eye for colour as Mr. Salomon's drawings manifest, it is remarkable that few, if any, of his buildings illustrate the importance of colour and the place it should hold in architecture.

Mr. Salomons gave a good deal of time to professional and artistic matters outside of his own office. He was for many years honorary secretary to the Royal Institution. He was a Fellow of the Royal Institute of British Architects and of the Manchester Society of Architects, which he helped to found and of which he was twice president. He was for a time on the Council of the Royal Institute. He was a member of the committee of the City Art Gallery, of the School of Art committee, and of the joint committee for promoting a chair of architecture in Manchester. Mr. Salomons for the greater part of his professional life had a succession of junior partners, the last two being Mr. John Ely and after him Mr. Steinthal. Besides architectural work, he had no inconsiderable practice in arbitrations; he was quick and decided in coming to a conclusion.

THE SAN FRANCISCO EARTHQUAKE.

In the *Engineering Record* Mr. Edward M. Boggs, chief civil engineer of one of the San Francisco railways, describes the effects of the earthquake on April 18. In the course of his letter he says:—

Generally speaking the buildings seriously injured were very old, of unsafe design, improper construction, or of poor materials. This earthquake was the best possible endorsement of the superiority of steel-frame construction for tall buildings. The "skyscrapers" were uninjured structurally by the shock. The damage they suffered was mainly to their finish and ornamental features. None of them collapsed; none contributed to the loss of life. Elevators were operated for hours or days after the shock and until the fire appeared. The instance of the Claus Spreckels building is typical. This is a twenty-one storey building 310 feet high, standing on a lot only 75 feet square. It had long been regarded by laymen as the most dangerous structure in the city in the event of earthquake, but it endured the shock nobly. I did not see it until the fire had swept through it, but it stands to-day an imposing structure. Parts of it are doubtless capable of being occupied after very slight repairs, although the building was far from fireproof and suffered greatly from the fire. The other steel-frame buildings have the same satisfactory records.

Of other types of buildings it may be said that their designers seem to have expected the earth to remain always quiescent. A few points concerning them have impressed themselves upon my mind. Massive masonry at great heights above the ground is dangerous, masonry walls at gable ends of high-peaked roofs are especially liable to fall. Heavy copings, parapet walls and enormous chimneys may become mighty engines of destruction. In some instances heavy brick chimneys on school buildings fell upon roofs and like titanic projectiles passed through every floor down to the basement. What a needless slaughter of children would have resulted had the time been later and the schools been filled as usual. It should be made a crime to perpetrate such an architectural blunder.

Many dwellings also were badly injured by their own chimneys crashing through their roofs, or those from adjoining houses rolling down and plunging through windows; and many persons were killed or injured in this manner. Reinforced concrete, sheet metal, or even terra-cotta are far superior to brick and stone for such a purpose. Most of those killed were in old and flimsy buildings which collapsed, doubtless in some cases the weaker buildings being pounded to pieces by the heavier ones around them. The calamity occurred at 5.14 A.M.; had it been an hour or so later, when the streets were crowded with people, the loss of life would certainly have been many times greater.

I have not seen a single fallen chimney which had been well braced to the roof, although many such were broken across at or near the roof line. Except in fortunate localities the destruction of unbraced chimneys was general, and even to-day almost the entire population of the unburned districts are subsisting on uncooked or cold food, or else cooking in their yards or in the streets, while awaiting inspections and repairs of their kitchen chimneys.

Enormous damage was done to stocks of goods by roof-tanks being overturned, breaking through the roofs and flooding the building. Such tanks could readily be braced so as to maintain their upright position.

Masonry walls should be well braced and tied together. If the building can sway as a unit instead of falling apart it will endure a surprising amount of racking. This is exemplified in the cases of many tall but well built church towers. These would seem by reason of their height to be peculiarly subject to destruction, but, on the other hand, their smaller diameters gave better facilities for braces and ties, and in some instances they stood far better than lower buildings having long walls. But still the damage to church buildings having unnecessary masses of masonry was very extensive.

The Palace Hotel is an example of a building having solid brick walls which withstood the shock well. This was doubtless due to the large number of intersecting partition walls, which were also of solid brick masonry of good quality. On the other hand, the Emporium building of about the same height, but having larger rooms and fewer partition walls, was badly wrecked.

A surprising amount of brick masonry which was thrown down was of poor quality, the bricks separating with clean surfaces, showing lack of adhesion of the mortar. Reinforced concrete having greater tensile strength would be incomparably superior to laid-up masonry.

As to the future of San Francisco. In my opinion it will rise from its ashes to a more magnificent future than would have been possible without this scourge of fire. It had been her misfortune that she had never been swept by a general conflagration. The loss would have been much less had it come ten years ago, but it is less now than it would have been at any time in the future. It is probable that the plan of the city will be radically changed. The original plan was a huge mistake; to perpetuate it now would be a crime. Streets should be widened, the checker-board arrangement of blocks on the steep hills abolished. Chinatown will be removed from one of the most desirable portions of the city. The way can now be opened to build the city as it ought to be built, and I believe it will be done. Its people possess the necessary courage, skill and resources. All that is lacking is the material. That cannot come forward fast enough. There will be an unlimited demand for building supplies for years to come, especially for structural steel and materials for steel-concrete construction.

Communications from other engineers are also given.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

The last of the monthly meetings of this Society for the present session was held in the National Museum of Antiquities, Queen Street, Edinburgh, on Monday. Mr. Thomas Ross was chairman.

Mr. Ludovic M'Lellan Mann, F.S.A.Scot., exhibited, on behalf of Mr. Arthur Hart, C.A., Glasgow, a drinking-cup urn recently found in a sandpit at Bathgate, and beads of vitreous paste found in Ayrshire by Bailie Joseph Downes, of Irvine; and gave details of the exploration of the floor of a prehistoric hut in Tiree. Stone implements and pottery found embedded in the soil of the floor were shown and their significance discussed, some of the pottery being of a class not hitherto recorded in Scotland, but not unlike some pottery of the Bronze Age from the south of England. Mr. Mann also described the important discovery in March last by Messrs. Robert Irvine, of Stevenston, and J. M. Orr, of Saltcoats, of at least fourteen cinerary urns containing burnt bones in a small cairn of the Bronze Age near Stevenston, Ayrshire. In one of the urns were found beads of vitreous paste and traces of thin gold, probably a small personal ornament. Mr. P. Macgregor Chalmers, F.S.A.Scot., gave a description of an earth-house at Ardross, in Fife, with a ground plan and photographs. Mr. Thomas Ross read a description of the exploration of the castle on the Isle of Loch Dochart, by Mrs. Place, of Glen Dochart, and exhibited a plan of the castle by himself and drawings of the objects found by Mrs. Place and other members

Digitized by Google

of her family, which included a number of interesting objects, including an iron fire-dog and two earthenware jars. The castle was built by Sir Duncan Campbell, seventh Laird of Glenurchy of that line, who succeeded in 1583 and died in 1631, and Mrs. Place found his armorial bearings sculptured on a tablet which had been inserted in the wall. Mr. Alexander Hutcheson, F.S.A.Scot., Broughty Ferry, gave a description, with a photograph, of a peculiarly shaped jug of earthenware, probably of the fourteenth century, found many years ago at Forfar, and recorded another instance of the insertion of earthenware jars into the walls of dwelling-houses which had lately been observed in Dundee.

TESSERÆ.

Oratory and Painting.

THERE are two good things in this world—a good speech and a good painting. It is difficult to say which is the better of the two. In many respects they are similar. Both represent ideas. A true painting embodies the lofty conceptions of the artist. The work of the true artist must have meaning. It must be the result, not of mechanical skill alone, but also of mental workings. The artistical blending of the colours must be accomplished according to an ideal image. It must be the outward manifestation of an outward thought. The painter must be, not the servile copyist of external nature, but the sketcher of his own vivid conceptions. So it is with a true speech. That, as well as a painting, must embody thought. The orator must accomplish the same that the painter accomplishes—the presentment of original conceptions. He must bring out the inner thoughts in bold relief and beautiful harmony. To do this he uses words as the painter uses oils. He must be an adept in word-painting. Then, again, both the orator and painter must have not only the original thought as the source of their work, but also the artistical skill necessary to its representation. To do this the painter labours with his paints, mixing and analysing them. He faithfully uses the brush in properly distributing them. The orator studies his mother tongue, unites and analyses words. Hence both require practice, and long, unremitted, toilsome practice. Both, too, though not servile copyists of nature, must be true to nature. To attain this end the painter studies forms in the natural world, the orator forms of language. The painter studies the human face and person, the orator studies the human heart. Both, too, must be good men. He is the true orator or painter who moves and satisfies man's nature, who stirs to its deepest depths the soul of man. But how can he who has not cultivated his own religious nature develop it, come to know it; how can he find the spring of its movement in others? How can he touch the chord in another's bresat who has never felt the vibrations of his own? Moreover, it is only when the religious part of man's nature governs and moulds the other parts that the whole being attains its highest perfection. Thus do the imagination and the intellect depend upon this higher part, the religious nature. And the orator or painter who would attain the highest development of intellect or imagination must reach it in the only way presented in the wonderful constitution of the soul. Both move the feelings. How many there are who can testify to the effect upon their soul of a genuine painting. How it excited thought, stirred emotion, awoke into active, breathing life the dormant energies of their spiritual being. And how many, too, by thrilling eloquence have been moved in the same strong way, and under its magic power have formed the stern resolve, nerved the strong arm and triumphed in the fearful crisis. Yes, both have strengthened the feeble knees of doubt, both girt up the loins of weakness, both have fired zeal, both have lashed into foam the surges of the soul. So the analogy between oratory and painting might be traced still further, showing the similarity in source, means and end.

Palavicini as Architect.

It is believed that Sir Horatio Palavicini erected the first house in England which was in the pure Italian style, having a loggia to the second storey with his arms over the portal. This he erected at Little Shelford, in Essex; it was taken down in 1750 or 1754. Sir Horatio was collector of the Pope's taxes in England in the reign of Queen Mary, on whose death and the change of religion that ensued he took the liberty of keeping the money himself, and settling in England built the house above alluded to. He was also possessor of the estate and house at Baberham, near Cambridge, where in the hall, on a costly chimney-piece, adorned with the history of Mutius Scævola, his arms remained. His family were buried at Baberham, as appears by several entries in the parish register, where also is recorded the marriage of his widow (exactly a year and a day after Sir Horatio's death, who died July 6, 1600); thus Mr. Oliver Cromwell and the Lady Anne Palavicini were married July 7, 1601. An account of the family connections of Palavicini with the Cromwells may be seen in Noble's "Cromwell." In Peck's "Desiderata Curiosa," p. 52, lib. 7, it is said when Lord Arundel was imprisoned by Queen Elizabeth for accepting the title of Count of the Empire, he referred his case to Sir Horatio and others, adding these words in his letters to one of the principal Lords of the Court:—"Neither doe I thinke England to be so unfurnished of experienced men but that either Sir Horatio Palavicini, Sir Robert Sidney, Mr. Dyer or some other can witness a truth therein." Walpole says:—"But Palavicini had higher merit, as appears by an incontestable record. He was one of the commanders against the Spanish Armada in 1588, and his portrait is preserved among those heroes in the borders of the tapestry in the House of Lords," engraved by Pine. We presume by this that he had been converted to Protestantism, as we find him fighting against a Power which he at one time collected money to support.

Rubens's "Taking Down from the Cross."

Rubens—who, among his other tastes, was a great florist—was very desirous to enlarge his garden by adding to it a patch of ground adjoining. It chanced, unfortunately, that this piece of land did not belong to an individual who could be tempted by a large price, but to a society or club called the "Arquebussiers," one of those old Flemish guilds which date their origin several centuries back. Insensible to every temptation of money, they resisted all the painter's offers, and at length only consented to relinquish the land on condition that he would paint a picture for them, representing their patron saint, St. Christopher. To this Rubens readily assented, his only difficulty being to find out some incident in the saint's life which might serve as a subject. What St. Christopher had to do with cross-bows or sharpshooters no one could tell him, and for many a long day he puzzled his mind without ever being able to hit upon a solution of the difficulty. At last, in despair, the etymology of the word suggested a plan; and "christo-pheros," or cross-bearer, afforded the hint on which he began his great picture of "The Descent." For months long he worked industriously at the painting, taking an interest in its details such as he confesses never to have felt in any of his previous works. He knew it to be his *chef d'œuvre*, and looked forward with a natural eagerness to the moment when he should display it before its future possessors, and receive their contratulations on his success. The day came, the "Arquebuss" men assembled, and repaired in a body to Rubens's house; the large folding shutters which concealed the painting were opened, and the triumph of the painter's genius was displayed before them; but not a word was spoken; no exclamation of admiration or wonder broke from the assembled throng; not a murmur of pleasure, or even surprise, was there: on the contrary, the artist beheld nothing but faces expressive of disappointment and dissatisfaction; and at length, after a considerable pause, one question burst from every lip, "Where is St. Christopher?" It was to no purpose he explained the object of his work: in vain he assured them that the picture was the greatest he had ever painted, and far superior to what he had contracted to give them. They stood obdurate and motionless: it was St. Christopher they wished for; it was for him they bargained, and him they would have. The altercation continued long and earnest. Some of them, more moderate, hoping to conciliate both parties, suggested that, as there was a small space unemployed in the left of the painting, St. Christopher could be introduced there by making him somewhat diminutive. Rubens rejected the proposal with disgust: his great work was not to be destroyed by such an anomaly as this; and so, breaking off the negotiation at once, he dismissed the "Arquebuss" men, and relinquished all pretension to the "promised land." Matters remained for some months thus, when the burgomaster, who was an ardent admirer of Rubens's genius, came to hear the entire transaction; and, waiting on the painter, suggesting an expedient by which every difficulty might be avoided, and both parties rest content. "Why not," said he, "make a St. Christopher on the outside of the shutter? You have surely space enough there, and can make him of any size you like." The artist caught at the proposal, seized his

Digitized by Google

chalk, and in a few minutes sketched out a gigantic saint, which the burgomaster at once pronounced suited to the occasion. The "Arquebuss" men were again introduced; and, immediately on beholding their patron, professed themselves perfectly satisfied. The bargain was concluded, the land ceded and the picture hung up in the great cathedral of Antwerp, where, with the exception of the short period that French spoliation carried it to the Louvre, it has remained ever since, a monument of the artist's genius, the greatest and most finished of all his works.

Correspondence

Royal Institute of British Architects' Council Election, 1906.

SIR,—May I ask for a little space in *The Architect* on Friday to point out a most unfortunate and fatal omission of my proposer's name in the official list of my nominators as a candidate for the Institute Council. The damage to my chance of election is of course beyond recall, but to leave out the name of a candidate's chief sponsor, and such an honoured and influential name as that of Mr. G. F. Bodley, R.A., is a very serious business and a most unconstitutional proceeding, and an expression of regret after the damage is done does not do much to mend matters. In case any of your readers may not have recorded their votes (which I doubt, as the list alluded to was issued last Saturday when the voting papers went out), it may be well that they should know how these things are managed, and certainly Mr. Bodley should know that it is not my fault that his name was left out as it has been.—Yours truly,

MAURICE B. ADAMS.

Edenhurst, Marlborough Crescent,
Bedford Park, W. : May 16, 1906.

GENERAL.

The Death occurred at Warrington on Saturday of Mr. J. Thompson, aged eighty-one years. Mr. Thompson had been the headmaster at the School of Art for nearly thirty years and trained a number of well-known artists, including Mr. Luke Fildes, R.A., and Mr. Harry Woods, R.A.

Mr. John J. Robson, M.I.C.E., has been appointed engineer to the Wardens of Rochester Bridge, in succession to the late Mr. V. de Michele, M.I.C.E.

An Exhibition of water-colours of glacier and moraine about Arolla, Saas Fee and Bel Alp, by Mr. Ernest George, is to be opened on Monday at the Fine Art Society Galleries in New Bond Street. The proceeds of the sale of the water-colours will be given towards completing the small church of St. George at Arolla.

Mr. W. E. Willink, of Liverpool, consulting architect to the Wrexham education committee, has presented his report on the competition for the best designs for the proposed Alexandra Council schools at Wrexham. The first premium of 50*l.* for the best set of plans is awarded to Mr. Frederick Willey, of Durham, and the second premium of 30*l.* to Messrs. Lumsden & Hardie, of Oxton.

The Dean and Chapter of Exeter Cathedral have decided, it is announced, to have an examination made of the foundations of the south tower. A crack extending from the ground level to the summit has existed for something like fifty years. There is no indication of any expansion or of any subsidence of the foundations; but in face of what has happened at Chester, Salisbury, Winchester and elsewhere, the Chapter think it desirable that there should be no room for doubt as to the state of the foundations.

The Royal Sanitary Institute will hold on May 26 a provincial sessional meeting at the Municipal Council Chamber, Bournemouth. A discussion will be opened by Dr. P. W. G. Nunn on "Sanitary Administration in a Health Resort."

Sir E. Durning Lawrence has presented over twenty pictures by well-known artists to the Lambeth Borough Council for the adornment of the new municipal buildings. The works have recently been on exhibition at Bethnal Green Museum.

An Inscription has been discovered at Timgad which is supposed to be unique, as it once served to designate an ancient librarian's or bookseller's shop.

Messrs. R. Cook & Sons, of Crawley, are the contractors for the new schools for the borough of Bexhill which we illustrated in our last issue.

Mr. Josiah Timmins Smith, of Rhine Hill, Stratford-on-Avon, civil engineer, who died on March 31 last, left estate valued at 120,728*l.* gross, with net personalty 120,233*l.*

An Exhibition of works by the late Fantin Latour is now being held in the Ecole des Beaux-Arts, Paris.

Mr. Horace W. Collins died last week at Portreath in his thirty-second year. He was agent and architect for Lord Clinton, and erected buildings in Redruth, where he practised.

The Arbroath Town Council have now received intimation from the Secretary for Scotland of his approval of the proposal to apply 750*l.* out of the grant received under the Education and Local Taxation Account (Scotland Act, 1892) towards the purchase of properties at Abbey Green, Abbey Park and St. Thomas Street, with a view to their demolition and the further opening up of the abbey ruins.

Sir John Brunner, M.P., has offered to present a library to Northwich, to replace the present Brunner Library, which is dilapidated owing to subsidence. It is intended to build a library and new municipal offices upon one site.

Mr. H. B. Brabazon, the water-colour painter, died at Battle on Monday at the age of eighty-five years.

The Annual Report of the Ruskin Museum, Sheffield, shows that the total number of visitors from March, 1905, to March, 1906, was 43,659, which is 7,000 less than last year, when a special exhibition of etchings and engravings was held.

Dr. Wilhelm Bode, the director of the Royal Gallery, Berlin, has prepared a large volume on "Rembrandt and his Contemporaries," containing studies on the Dutch and Flemish masters of the seventeenth century.

Several of the Young Architects of Paris have emigrated to San Francisco in the expectation of finding commissions for new buildings.

The Members of the Royal Society of British Artists have decided that a president to succeed Sir Wyke Bayliss must be chosen from the ranks of ordinary members. But as several eminent "outsiders," including two Royal Academicians and one Associate, are anxious to fill the vacant post, it has been resolved to hold a special meeting on the 24th inst. for the election of members, so that the gentlemen in question shall have an opportunity of joining the Society and thus be enabled to stand for the presidency. The presidential election will take place on June 11.

A Technical Institute is to be erected in Dundee. The estimated cost of site and buildings is 50,000*l.*, one-half of which is expected from the Education Department. National Art Survey scholarships of the value of about 30*l.* each, tenable for six months, have been awarded by the committee of the school to Mr. W. J. Walker Todd, with Mr. T. P. Marwick, architect; and Mr. Sydney H. Miller, with Sir R. Rowand Anderson.

The Following Architects have been selected by the Council of the University College of North Wales, Bangor, to send in competitive designs for the new buildings which it is proposed shortly to erect:—Mr. W. D. Caröe, Mr. J. F. Doyle (Liverpool), Mr. H. T. Hare, Mr. A. Marshall Mackenzie and Mr. Arnold Mitchell. The estimated expenditure is 200,000*l.*

The Managing Committee of the British School at Athens have elected Mr. R. McG. Dawkins, Fellow of Emmanuel College, Cambridge, as director of the school, in succession to Mr. R. C. Bosanquet, lately appointed to the chair of Archæology in the University of Liverpool. Mr. Dawkins has assisted in the excavations carried on by the school at Palaikastro, in Crete, and is at present engaged in assisting Mr. Bosanquet in the school's work at ancient Sparta.

The Galleries Committee of the Glasgow Corporation, after visiting the exhibition of the Royal Institute of Fine Arts, purchased the following pictures:—No. 285, "The Day of Rest," by Mr. Patrick Downie, R.S.W. (250*l.*); No. 494, "Interior of St. Maclou, Rouen," by James G. Laing, R.S.W. (52*l.* 10*s.*); No. 419, "Grouse," by Mr. Edwin Alexander, A.R.S.W. (35*l.*).

The Sunderland Town Council were informed at their last meeting that the premiums offered for designs for branch libraries to be erected out of the Carnegie gift of 10,000*l.* had been won—the first by Mr. Hugh Hedley and the second by Mr. Clayton Green, both of Sunderland.

The Architect.

THE WEEK.

THE doctrine of common employment prevented servants from recovering damages from their master if they were injured by the negligence of a fellow servant. The principle, it has been said, was that a servant, when he engages to serve a master, undertakes as between him and his master to run all the ordinary risks of the service, and this includes the risk of negligence on the part of a fellow-servant whenever he is acting in discharge of his duty as servant of him who is the common master of both. The Workmen's Compensation Acts have deprived this doctrine of much of the importance which it once possessed. But that it may still have some application in cases where those Acts do not apply is illustrated by the case of TOZELAND *v.* West Ham Union. In that case the plaintiff was a pauper inmate of the defendant Union. The Union was engaged in enlarging the electric-light installation at their workhouse, and they were carrying on the work by means of their own servants. The plaintiff was ordered by the labour-master to work on a staging formed of a ladder and a pair of steps with a scaffold-board between the two. The staging collapsed and the plaintiff suffered injuries which necessitated the amputation of his leg. The County Court judge held that the doctrine of common employment prevented the plaintiff from recovering. This decision was reversed on appeal, on the ground that this doctrine was based upon the fact that the servant had voluntarily undertaken the employment; and it could not be said that a pauper, who is bound to obey the orders of the labour-master, voluntarily undertakes labour which he is bound by law to do.

THE case above cited raises also another interesting question, the question, namely, as to the circumstances under which a public body, such as a board of guardians, may be made liable for the acts of their subordinates. It is clear that "it is difficult to apply to public bodies who act by agents the ordinary rule of law as to the liability of a principal for the acts or omissions of an agent," but it is not quite clear where the line is to be drawn. On the one hand, it seems to be certain that such an action will not lie for every breach of a statutory duty. It would not, for instance, be open to every pauper to sue the guardians if he thought that food of insufficient quantity or quality had been supplied. On the other hand, if the guardians do acts by their agents, and these acts are done negligently and so damage a third person, they are liable. The Court found considerable difficulty in deciding under which category the present case fell. With some hesitation it thought that the guardians were liable because they were doing acts which, though lawful and reasonable, were not done under any statutory duty. They might, for instance, have employed an independent contractor to do the work. That being so it was thought that the guardians were liable for the negligent acts of their agents. If this case is rightly decided the test would seem to be, Is the public body doing acts it is formed to do and so acting under a statutory obligation, or is it simply using its own discretion as to the mode of doing an act which it need not necessarily do for itself?

THERE are so many claims on the Treasury for assistance in obtaining aids to our knowledge, it is difficult to satisfy them all. The authorities of galleries and public institutions have always a wish to demonstrate that Peace hath her victories as well as War, by carrying off works of art or antiquity from the representatives of other nations. The contests for such treasure may be bloodless, but they are generally very costly. But if we will have an expensive Army and Navy, and a Civil Service which is without any parallel elsewhere for its expensiveness, we must allow a great many things which would be of service in our museums and galleries to enrich other cities. One result of the economy was explained at the last meeting of the Hellenic Society by Mr. CECIL SMITH, the Keeper of the Department of Greek and Roman Antiquities, British Museum. According to him the amount now expended is less than two-thirds of the amount which was available fifteen years ago. Yet it cannot be denied that the competition to gain antique objects is more keen than formerly. Mr. C. SMITH considers that at least 10,000*l.* a year is required if desirable objects are to be obtained from private collections in this country. As suggesting the difficulties which await an official, he pointed out that for twenty years he had been watching a vase from Clazomenæ, which was produced about the middle of the sixth century before our era. Fortunately, it has been acquired for the British Museum. Among other riches are several examples of work in ivory, Greek jewellery and statuettes. In the acquisition of works of art promptitude is usually desirable. If long reports have to be prepared to submit to the Treasury, it is not impossible that a bargain will be struck with some other country and loss would be incurred.

IN America the question of adoption of the metric system appears to give rise to much difference of opinion. A Bill was introduced which proposed that in transactions with the Government the system should be adopted. But the standing committee of Congress on coinage, weights and measures have reported against the proposal. A committee of the American Institute of Electrical Engineers having expressed approval of a change, it was decided to ask the members to vote by ballot on the subject. About 3,300 voting papers were sent out. Only about one-half the members took the trouble to fill up the forms. It was found that 1,569 of them were in favour of the committee's resolutions, and only 178 against them. The reasons which guided the committee of the Institute were the very great advantages of the metric system by its simplicity, consistency and convenience in everyday use; that all the electrical units in universal use, such as the volt, ampere, ohm, watt, &c., are metric units; and that the industrial use of these electrical units would be much facilitated by the general adoption of the metric system.

THERE are no standards as yet in this country to regulate the strength of blocks of artificial stone or concrete which are largely used in American cities. New York has imposed one which is severe, although it is said several varieties are equal to it. According to regulation No. 14, "the modulus of rupture must average 450, and must not fall below 350 in any case. The ultimate compressive strength must average 3,000 lbs. per square inch, and must not fall below 2,500 in any case. The percentage of absorption (being the weight of water absorbed divided by the weight of the dry sample) must not average higher than 15 per cent., and must not exceed 20 per cent. in any case. The reduction of compressive strength must not be more than 33⅓ per cent., except that when the lower figure is still above 3,000 lbs. per square inch, the loss in strength may be neglected." The requirements for Philadelphia differ from the above to a surprising extent, as will be evident from the following:—"The modulus of rupture for concrete blocks at twenty-eight days old must average 150, and must not fall below 100 in any case. The ultimate compressive strength at twenty-eight days must average 1,000 lbs. per square inch, and must not fall below 700 lbs. in any case. The percentage of absorption (being the weight of water absorbed divided by the weight of the dry sample) must not average higher than 15 per cent., and must not exceed 20 per cent. in any case. The reduction of compressive strength must not be more than 33⅓ per cent., except that when the lower figure is still above 1,000 lbs. per square inch, the loss in strength may be neglected." It will be observed that the form is similar, but the figures are much lower in Philadelphia than in New York.

CHURCH ARCHITECTURE.

THE remarks of Mr. TEMPLE MOORE at the annual meeting of the Church Building Society, which will be found on another page, are a revelation about the weakness of many designs which are prepared for churches in our time. It is, no doubt, difficult to satisfy the expectations of any body of experts, but anyone who is acquainted with modern practice will be disposed to agree with the censor. In fact, the conditions under which work is produced in our time are of a kind to favour immaturity in designs. Haste rules everywhere, and it is a very general belief that if a commission is to be "pulled off" it is absolutely necessary to prepare the drawings without delay.

Apart from the peculiar conditions of practice, modern Gothic is liable to be affected by freakishness. We may assume that the designs to which Mr. TEMPLE MOORE referred are in that style, for any variety of a Renaissance church is only produced under exceptional conditions. Now the difference between all the variations of Classic as compared with Gothic may be summarised by saying that the former are more simple than the latter. A Greek temple, as we know, depended on the proportions and perfection of form of a few elements. It was therefore easy at one time in England to design churches which would bear more or less resemblance to a Greek temple. Indeed, gate-lodges and places of worship differed only in size. Besides simplicity there was another advantage in having definite proportions for all the parts. Careful measurements of Classic remains revealed that the Greeks allowed themselves some liberty in dealing with the proportions of their columns and mouldings. But in some of the books in which engravings of the orders were given as patterns, divergencies were not recognised. Towards the end of the eighteenth century and in the first quarter of the nineteenth the majority of the men who practised in England believed that there was only one definite set of proportions, although they were not clear from whence it was derived.

Indeed, we might say that not merely the architects, but the writers of books and essays when they occasionally referred to architecture, endeavoured to demonstrate that there was one fixed canon for a Classic building, whilst in Gothic everything was irregular and perverse. That belief was not confined to Englishmen. French writers of undoubted genius held similar opinions. Archbishop FÉNELON was an exquisite judge of literature and art, and he was accustomed to officiate in Gothic cathedrals. But he considered Gothic architecture as the creation of the Arabs, men who had neither rules nor culture and who were prone to false subtleties, sophists in reasoning and *amateurs de colifichets en architecture*. He must have suffered every time he sat in his episcopal chair. With such an authority before them we need not be surprised if many other critics adopted the same views.

When in the course of time Gothic architecture again came into favour, it was to be expected that theorists as well as practitioners should endeavour to demonstrate that the style was consistent in all its details. At first, no doubt, it was a difficult task, for it could not be denied that there was a vast difference not only between the appearance of one Gothic church and its neighbour, but that in the same building there was often little correspondence between the different parts. Windows might be narrow or broad, columns of cylindrical or polygonal form, &c., and the character of the masonry might vary as if produced by workmen who differed in ability. But as soon as, after much investigation, it was ascertained that Gothic represented the work of various periods, then the apparent confusion became orderly and representative of history. It was therefore excusable for men who were disposed, like some of those who utilised Classic models, to believe that perfection had been reached, and that the wisest course would be to avoid producing any form which was not warranted by precedent.

It is needless to say that many of those who are most enthusiastic about Gothic did not adopt that view. Or, if they partially admitted it, the reason was they were afraid of being considered revolutionary and unsafe. PUGIN was a zealot, but he never had the opportunities to store his mind or his note-books with details of ancient buildings. He was little more than a boy when he had secured a large practice. The want of definiteness in his knowledge as regards detail was suggested by the alteration in the title-page of his "Contrasts." Originally it was "A Parallel between the Noble Edifices of the Fifteenth and Sixteenth Centuries and similar Buildings of the Present Day," while in the second edition "Middle Ages" was substituted for the two centuries. He was confident that he had grasped the true spirit of Mediævalism, and when we remember how limited was his preparation his buildings are remarkable. But his success was sufficient to demonstrate that an exact study of details was unnecessary.

There were many architects who considered his buildings simply as examples of the Puginesque, but the words if not the practice of some men tended to demonstrate that an exact imitation of English work was not called for. STREET declared that the practice of architecture, *i.e.* of Gothic, was seriously impeded and hampered by conventional restrictions. Men were blamed because, although acquainted with ancient precedents, they could not produce ancient authority to warrant the legitimacy of what they did, or because the authority might be derived from some other country. In other words, he desired foreign elements in English Gothic. Architects like BURGES gave most of their attention to foreign Gothic and did their best to imitate it. The annual report of the Church Building Society acknowledges indebtedness to the services of the late JOHN P. SEDDON. But he advocated individuality rather than faithful adherence to ancient Gothic examples. Styles, he thought, might be useful to the antiquary, but he believed they were the bane and hindrance of architects, and he advised that each architect should shun plagiarism as a stain upon his reputation. Lofty and graceful proportion, vigorous light and shade, fairy tracery and fretted vaulting were not, he said, a Gothic patent. The well from whence they were drawn is open to us, and we may do more and better than the architects with whom such features are associated.

It is well to bear in mind that at a time when Gothic was supposed to be supreme, there was a spirit of revolt among its most zealous adherents. Then when its power declined, it was inevitable that chaos should come again. If Classic was treated with freedom, and we might say with license, who could expect that Gothic would become more regular and be marked by loyalty to ancient examples? The periods of the style were all indicative of efforts to supplant older details by others which were considered to be more favourable. The influence of that spirit of innovation has marked a great many Gothic designs which have appeared during the last thirty years. New ideas about restoration have also had the effect of making men believe that incongruities are only very venial faults, and that so long as the prominent features of a style or period are recognisable, it matters little if we see forms which would have amazed Mediæval designers.

With such conditions around him a young architect of only average ability, when invited to prepare designs for a church in some rural district or in one of the slums of a town, is likely to think that he must produce something striking, although the money to be expended is restricted in amount. In the majority of cases churches are now of the cheap species. But it is not considered desirable that poverty should be too obtrusively expressed. To make a little go a long way is really the task before the church architect. His design may be approved by the local clergy who know all the circumstances of the case and the requirements

Digitized by Google

of the congregation. But that, of course, does not necessarily make the design a work of art.

It should also be remembered that the advisory committee of the Incorporated Society are not the best judges in all cases. They naturally look upon themselves as the guardians of ecclesiastical architecture and the enemies of all abberation. In the old days people who used to read the *Ecclesiologist* found it recorded that the tribunal of taste which then existed made no scruple about condemning designs by architects whose names will ever be associated with the Gothic revival, while those of their censors have long been forgotten. Some of the latter were personally in favour of departures from stereotyped forms. But officially they had to act as if planning and designing had been long ago determined for future ages. There is no doubt some of the designs submitted for approval in order to gain grants may be only weaklings of the art. But others may contain germs which deserve to flourish, and it would not perhaps be correct to say of the designs as a whole that they are unworthy of the purposes for which they are intended.

THE SIMPLON TUNNEL.

THE announcement of the opening of the Simplon Tunnel on Saturday by the King of ITALY and the President of the Swiss Confederation must give satisfaction to all who take an interest in efforts to facilitate communication between nations. As the King remarked on the occasion, works of the kind inspire us with the expectation of a more civilised and happier future for humanity. The operations were commenced in August 1898, and the whole of the difficulties which had to be overcome may one day be related. But anyone who is accustomed to deal with tunnelling can imagine the number of contingencies likely to arise in executing a double line, each having a length of 12¼ miles.

NAPOLEON, in his march to conquer Italy, had to pass over the Alps mounted on a mule. Realising by experience the difficulties and risks of the journey and the impossibility of extending commerce unless there was a change, he ordered a road to be made over the Simplon. In the course of four years the work was completed, partly by French engineers, partly by Italian. The portion undertaken by the latter is generally considered as the most satisfactory. It is needless to say the new works were not generally approved. There were travellers who seemed to think that the glorious views would lose their interest, as they could be enjoyed by the multitude, while others prophesied that the work must be overwhelmed by avalanches in the course of a year or two. The road up to the present continues to be practicable, but the Swiss have demonstrated their prudence by fortifying the great cutting at Gondo, in order to put a check to invasion on one side.

Although the road winds in a remarkable way, the fact still remains that an elevation of about 5,000 feet has to be ascended. When railway enterprise had demonstrated the practicability of tunnelling on a grand scale, as far back as 1832 it was proposed to construct a tunnel from Brieg on the Rhone to a station on the Diveria, which runs into Lago Maggiore. From time to time the subject was revived, and in 1875 a company was formed for the purpose; but it could not be said that an attempt was made to start the works until 1895, when the Governments of Italy and Switzerland granted to the Jura-Simplon Railway Company the privilege of constructing a line between Brieg and Iselle, an extension between Iselle and Domo d'Ossola being the work of the Italian railway department.

As the two rivers, the Rhone and the Diveria, supplied immense water-power, it was decided to employ hydraulic drills at the Swiss end and at the Italian end. BRANDT'S system was found to be so effective that sometimes a length of over 20 feet was pierced in a day. Necessarily the operations had to be independent. It was impossible under the circumstances to definitely mark the course of the tunnel, and that the headings met is creditable to the mathematical skill of the engineers. At the Italian end it was found necessary to make provision for the use of steam-power whenever required. No less important were the arrangements for ventilation. Plant for the purpose was set up at each end, consisting of turbines which drove fans about 12 feet in diameter. As there were two lines of tunnel ingenuity was exercised in constructing passages by which air was kept in circulation in both of them. Great care had to be taken in controlling the ventilating machinery, for a little excess would extinguish the lamps which had to be used by the workmen. Another difficulty arose from the necessity of keeping the air sufficiently cool to allow the men to labour without fatigue. Provision was also made for illumination by electric power, but some authorities considered that not enough use was made of the facilities which electric light offered. Navvies have their own ways, which they uphold as if they were superstitions; and they may have thought there was greater safety with lamps, which could be controlled by the men who used them, than with a light which was generated beyond the tunnel.

At both ends there had to be buildings used for workshops for preparing the timber and other materials required in the operations. There were also houses for the workmen, some of whom had families. In fact, it might be said that a small town had been created both at the Italian and Swiss ends.

English railway tunnels are commonly about 24 feet in greatest width, while a double line of rails has to pass through them. The width of each tunnel on the Simplon line is only 5 metres, or 16 feet 3 inches. The height from the permanent way is about 19 feet. From centre line to centre line the width is 17 metres. The section is not uniform throughout, for the depth of the lining varies according to the nature of the strata. One of the tunnels is not completely constructed, for it is believed that at first one will suffice for the traffic. In excavating, a drift was cut at the bottom 3 metres wide and 2 metres high. Then at regular distances shafts were cut to the upper heading, and finally the material of the sides was removed. The timbering of the lower drift was retained until all above it had been removed. The hydraulic drills were invaluable, and in some parts holes of over 30 feet in length were pierced in twenty-four hours. Two kinds of explosives were utilised. The cross galleries and the second tunnel were used as refuges during the explosions, and owing to the carefulness of the Italians, who were mainly employed, the accidents were few. Horses removed the stuff after the explosion, but the confined air did not agree with them, and their death-rate was high.

The tunnel, as we have said, is lined throughout, the thickness varying according to the pressure expected to come on the masonry. In other words, it was thicker where the work appeared likely to settle. The side walls to the springing were first erected, and for the curved heading steel rolled beams were employed, which were bent to the contour. On them a lagging of boards was placed, and the construction of the arch became comparatively easy and was more uniform than if timber centres had been employed. The absence of framing which would be required with the latter likewise allowed more ample space for raising materials from the waggons. The drainage of so large a tunnel required the utmost care. The water is carried behind the lining to a drain which runs along a little below the level of the permanent way.

The Simplon Tunnel is the fourth which now passes through the Alps. The Mont Cenis Tunnel was commenced in 1857, and for about three years the boring for the explosives was performed by hand. If continued in that way the tunnel would have taken at least thirty

Digitized by Google

years to complete. By the use of drills which were operated by compressed air with the aid of water-power the rate of progress was trebled. It required, however, about thirteen years before the tunnel could be traversed. About a year after the two headings were connected the tunnel was opened, and has now been about thirty-five years in operation.

The success of the Mont Cenis Tunnel was so manifest that within a year the St. Gothard Tunnel was undertaken. For some months boring by hand labour was employed, for owing to the eagerness of the promoters they did not wait until the drills were ready. Experience enabled the tunnel to be completed in about seven and a half years; the tunnel is 9⅜ miles in length. The third tunnel beneath the Arl mountain is 6⅓ miles long, and was completed in three and one-third years owing to the improvement in the drills. The Arlberg Tunnel was also the cheapest of the three, costing only 108*l.* per lineal yard, whilst the St. Gothard Tunnel cost 142*l.*, and the Mont Cenis 224*l.* It will thus be seen that even with such exceptional works experience and economy go together.

The Simplon Tunnel, as we have said, has been a long time under consideration, and from the objections raised it might be imagined that tunnelling beneath the Alps was not already accomplished. As the line would have to be at a depth of about 7,000 feet below the Alps, it was thought that the heat and difficulty of ventilation would cause the tunnel to be ill-adapted for the purposes of a railway. It remains to be seen whether any novel difficulties will arise, but it may be taken for granted that as a large number of workmen have been able to live at so low a level, passengers in railway carriages are not likely to be called on to endure much inconvenience. Besides, the problem of ventilation is not a mystery, and fresh air can be compelled to traverse the tunnel to any extent that is considered desirable.

Tunnels, unfortunately, which run between different kingdoms can be considered as aids to invasion of one or other of them. If that objection could be removed channel tunnels between England and France and Scotland and Ireland would be started within a year. At present it does not seem probable that either Italy or Switzerland will go to war with one another, or as an allied army to attack an adjoining country. The new tunnel must therefore subserve the purposes of peace, including greater facilities for trade. The completion is not only a great engineering event, but the creation of an instrument which, like the humblest road, may aid in the purposes of civilisation.

FANTIN-LATOUR.

THE high prices paid on Saturday at Christie's for works by the late Fantin-Latour, while paintings by English Academicians were bought at prices which were surprising from their insignificance, are evidence that the French painter is at the present time one of the few foreign favourites of the English public. M. Jérôme Tharaud visited him a few months before his death, and he gives an account of his experience in the *Figaro*.

"I found him," he writes, "in the Rue des Beaux-Arts, alone with a goddess seated on a cloud in the atelier he rented when he was eighteen and had just come from the provinces to Paris, and in which he lived during the rest of his life. The countenance of the old master was rosy and white and as delicate in colour as an apple blossom. He wore a green shade in order to protect his eyes. The stove was lighted, and the hail which beat against the windows of the atelier helped to create an intimacy which was adapted to the recalling of souvenirs. A cat who jumped towards a palette which was drying near the stove gave an opportunity for talking.

"'You see that palette,'" said Fantin-Latour; "'it is made up in the same way as that of Delacroix towards 1859. The colours are pure, clean, well apart and the whole is clear and gay. But to-day, is there anybody who cares about colour? My real contemporaries have vanished. Can our modern exhibitions possess interest for a man who was dazzled by the vision of the Salon of 1859, to which Delacroix had contributed so many of his masterpieces? At that time he was displaying the whole force of his genius, but the public had ceased taking an interest in him. The few survivors of romanticism had renounced him, for they never pardoned his abandonment of romanticism in order to discover himself.' M. Fantin-Latour spoke so warmly of Delacroix and with so much veneration, I asked him whether he had known the painter. He replied, 'Alas! no, I did not know him, and that is one of my regrets. No artist's life was more beautiful. He was a true aristocrat, full of scorn for the crowd. Public opinion had no influence with him, neither praise nor calumny could turn him aside from his route. He was a true model for artists to follow. It is now impossible to describe all the harm that has been done by criticism and advertisements. Every day we hear of some new genius who has been discovered by a journalist. And it happens that many a man who may be happily endowed becomes a fool. We are praised, condemned, advised, pitied, in fact people busy themselves too much about us. Many artists have I known who were spoiled by writers. Take Courbet as an example. He came back from Germany full of enthusiasm for woods, lakes, mountains and deer. He painted in a true way. One day, however, Prudhon persuaded him to imagine that he was a thinker, a philosopher, and from that time Courbet became an insupportable talker and a bad painter. In place of following his own instincts he invented imbecile theories. Look also at Manet, who was launched by the journalists. He did not became a Socialist, like Courbet; he did worse, he became a worldling. His atelier was like a fair. The whole boulevard could be seen in it. I could not visit him. However, he was an exquisite, a child. Baudelaire loved him, and also Gautier, the only littérateur who was able to understand painting. Gautier, being the older, regarded Manet and myself in a friendly way, but with a superior and indulging manner. I painted his portrait, but he scared me. I was one of his admirers, although I was not able to read his books, and on that account I was afraid to appear before him on account of my ignorance, and consequently I was silent. But there was no need for me to speak—he did all the talking. He asked me one day if I had read the "Mémoires d'Outre-Tombe" (the posthumous work of Chateaubriand). He described it as the finest work of the century in a tone that would allow of no objection. Gautier disliked the critics who were enthusiastic about imitators of the early primitives—artists who had neither grace nor passion.'" M. Tharaud endeavoured to defend at least one of the French primitives, but Fantin-Latour would not admit that the men who were known as such were entitled to the name. They were mere imitators of the artists of Fiesole and Bruges. The true primitives were Watteau, Chardin, Fragonard, and not the men who painted figures like those made of gingerbread with emaciated bodies.

"This disdain of the primitives and disgust of asceticism was in keeping with the atelier itself, for on the walls were copies from Veronese, suggesting the love of paganism and the Renaissance in the city of Titian and Giorgione. And yet Fantin-Latour had no more visited Venice and Florence than he had known Delacroix. Nor was he eager to journey to Italy. 'What should I do in Venice?' he asked. 'Ricard told me that the finest works of the Venetians are in the Louvre, and I know the Louvre well. In it I passed my youth, for I had no living teacher. The dead are the best teachers, and they are neither irascible nor tyrannic. At present students of art scorn to copy the masters; they labour, it appears, after nature. Fools! they begin where they ought to finish, for nature is the most inaccessible of all masters. They paint open-air landscapes. I love Corot, I love Rousseau, but they have had too many imitators. The human face has more mystery and beauty than the largest tree or the most complicated moonlight scene.'

"The words seemed to come from the depth of his heart. No painter has shown more affection for the human countenance For his own satisfaction, for ours and for those who will come after us, he has made true representations of the gestures, the eyes and the attitudes of some of the men who have had most influence on their contemporaries, such as Baudelaire, Rimbaud, Manet, Verlaine, &c. Fantin-Latour has painted them in groups gathered round a piano or an easel. What chapter of literary history is equally effective in recalling those men? Works of that kind he produced in his youth. But upon his easel was the painting of

Digitized by Google

a goddess, a dream-like pagan image of sensual grace, partly concealed by a cloud. 'That,' he said, 'is a painting of an old artist. I have first copied the masters and then nature. But for some years I have painted my dreams. Little by little in growing old I have passed from reality to dreams—and the voyage will continue for the rest of my life.' That voyage has come to an end. After having discovered all the secrets of his soul it was a happy destiny for an artist who, before he was touched by the finger of Persephone, has expressed his thought of the future in the most frank manner."

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A SPECIAL general meeting of the Institute of Architects was held on Monday evening last at Conduit Street, W., Sir John Taylor, K.C.B., vice-president, in the chair.

On the motion of the Chairman the following resolution, passed at the special general meeting of May 7, was confirmed:—"That the President and members of the Council for the current session do retain office until the conclusion of the Seventh International Congress of Architects to be held in July, and that, in order to give legal effect to this resolution, the provisions of by-law 30 affected thereby be temporarily suspended."

Mr. Alexander Graham (hon. secretary), at the ordinary meeting which immediately followed, announced the decease of Mr. Edward Salomons, who was elected Associate in 1851 and Fellow 1860. The name of Mr. Salomons, he said, was familiar to all of them as an architect of high repute in Manchester. He was president of the Manchester Society of Architects on two occasions, and some years ago he represented his Society on the Council of the Institute.

A vote of condolence and sympathy was passed to the family and relatives of the deceased.

Mr. PAUL WATERHOUSE, M.A., read a paper on

The London Traffic Commission Report.

The author centred his attention chiefly on the proposal of the Commission that the traffic congestion of London should be relieved by certain alterations of existing streets, and notably by the construction of two new thoroughfares, one traversing the town from north to south, the other linking Bayswater with Whitechapel. The architectural problems connected with these new streets he put briefly in the form of three questions, viz. (1) Granting the necessity for two new thoroughfares more or less in the localities selected by the Commission, what attempt, if any, should be made to control the architectural treatment of the new buildings which will form their frontages? (2) what relations should these new roads bear to existing roads, streets and squares? and (3) what will be their effect as regards the destruction and retention of existing buildings of value or interest? Alluding to the question of locomotion, the author noted that the Commissioners' proposals were based on the continued use and development of surface tramways. Recent experience of the motor omnibus, however, had upset the Commissioners' decision "that tramways would continue to be the most efficient and the cheapest means of street conveyance." This question of locomotion affected the architectural problem in two points. In the first place, there were objections to the direction and position chosen for portions of the new avenues, the choice of which had been regulated by the location of existing lines of tramway. Secondly, the width recommended for the main avenues—viz. 140 feet—was obviously an outcome of the proposal that each avenue should be encumbered with four lines of tramways. If these lines were given up wholly or partially a less width—say 100 feet—would be acceptable. Discussing the Commissioners' plan, the author pointed out that the map the Commissioners had made use of was not a scale map, and their intentions were not very clear. He had, therefore, transferred the problem to a survey drawn strictly to scale, and he presented for consideration, not the Commissioners' authentic plan, but his own interpretation (drawn to true scale) of their intentions.

Dealing first with the west-to-east avenue, which it was proposed to strike north-eastward from Hyde Park at a point adjoining Victoria Gate, forming at that point a continuation of the Bayswater Road, which it was intended to widen all the way from Shepherd's Bush station, the author pointed out the undesirable oblique junction of two important thoroughfares which would take place, and showed how by a slight deviation it could be overcome. As to the question whether in adopting the line of an existing street the widening should be effected by the abolition of the existing buildings on both sides, or by the pulling down of one side only, leaving the remaining frontage to form the building line of the new street, the author recommended in the case of Connaught Street the destruction of both sides, so that Hyde Park Square might indicate the axis of the first straight length. At Connaught Square he would appropriate the north portion of the garden, leaving the south of the square intact; and in Portman and Manchester Squares the new street would follow respectively the north and south sides. Coming to the junction of Regent Street and Portland Place, he proposed the removal of Queen's Hall, and the formation of a circular roadway round All Souls Church. At this point he offered for consideration a route alternative to that of the Commission, giving reasons for its adoption and illustrating it by means of a specially prepared plan showing the route proposed. Passing through East Marylebone, the avenue, he said, could glide between the churches of St. Andrew and All Saints, and cross Berners Street nearly at right angles. Touching on the absorption of square gardens which the adoption of either the Commissioners' scheme or his own would entail, the author observed that the loss of air-space would be nil; the ground would be absorbed not by inhabited buildings, but by houseless space. The avenues themselves would be substantial additions to the breathing-ducts of London. He proposed also that at certain points in the route new open spaces should be formed. The route he suggested would lead through Russell Square and run parallel past the Foundling Hospital. Here, explained the author, contact was rapidly being approached with the great north and south avenue, a feature of the Commissioners' scheme most open to criticism. Assuming that the official lines were accepted, the abrupt changes of level which characterised Mount Pleasant would lend themselves admirably to what was undoubtedly desirable at the intersection of two such gigantic roads, viz. an over-and-under or viaduct treatment. At the eastern end of the avenue there was a problem which the Commissioners seemed hardly sufficiently to have considered. The plunge through the Finsbury district, cutting through Finsbury Pavement House and the site of the displaced Roman Catholic church, involved the destruction of a mass of very costly new buildings and the mutilation of an attractive formation of frontage—the curve of Finsbury Circus—which seemed likely to result in a very heavy expenditure, not sufficiently balanced by compensating advantages. Might not the avenue instead of passing along the south of Liverpool Street and Broad Street stations, cross the rails at a point north of the station buildings, where a road bridge already exists? If this proposal were adopted, the avenue would connect with Whitechapel Road and Commercial Road at the same point as is intended by the Commission, but it would fall in from a more northerly direction and would face the end of Leman Street.

As regards the north and south avenue, the author pointed out the very serious difficulties in the way of adopting the route proposed by the Commissioners, owing to the many important buildings between Holborn and the river, and suggested an entire change. Assuming that the Temple Pier was the point at or near which a new bridge was wanted, why not strike a nearly straight line for a magnificent street running from the great entrance of the Law Courts to the dome of Bethlem hospital? This street would, of course, be treated as regards level in the same way as Waterloo Bridge Road. That is to say, it would not descend to the level of the Embankment, but retaining the high level secured at the Fleet Street or Strand end, it would pass over the Embankment Road and would only descend on the south side of the river to pass under the railway lines near Waterloo Junction Station. It would, in fact, pass over Commercial Road, which would only need to be slightly dipped, and getting level with Stamford Street would pursue the existing roadway levels under the railway. The south end was sufficiently near the Elephant (the southern haven of the Commissioners), and the junction with the Strand was an approximation to the eastern horn of Aldwych. From Aldwych northward the avenue was ready made to Theobald's Road, and thence the bargain already effected between the London County Council and the Duke of Bedford for the widening of Southampton Row seemed to suggest that the avenue should take that line to Russell Square, where the author proposed the two great avenues should intersect. This intersection would be in a sense the most important street centre in London. It was essential that it should be an over-and-under intersection, an engineer-

Digitized by Google

ing feat which, if steep gradients were to be avoided, must influence, as far as levels were concerned, some hundreds of yards of roadway on each side of the intersection. If it were possible to acquire enough land to extend the open space some 300 feet eastward the inconvenience of the changes of level by making the intersection, so to speak, in the open would be minimised. To avoid robbing Bloomsbury of its best breathing space, the author suggested the open ground being left free of building. The cutting and viaduct proposed would meet, not in a huddle of shops, but in an open pleasaunce of grass and green trees, nearly all the best of the present noble trees remaining undisturbed. North of Russell Square the line of route might continue along Woburn Place, effecting the widening on the left-hand side so as to avoid injury to St. Pancras Church, and taking beyond the Euston Road the track of Seymour Street. But here, again, the author suggested an alternative going east of St. Pancras Church. Assuming that the Commissioners were right in their idea that Upper Holloway was the district with which connection must be made, it seemed obvious that the Camden Road was an existing thoroughfare of which advantage should be taken. The author claimed that by carrying the avenue up to his proposed termination near Camden Town Station he had not only brought it within touch of a ready-made avenue to Holloway, but had put it into a position from which connection could at once be made with Highgate and Hampstead trams, and in the future avenues could be prolonged thence to either or both of these places.

The author claimed for his new north and south route that it performed its purpose with more dignity, at less cost, and with far fuller efficiency than the Holloway-to-Elephant route of the Commissioners. It collected traffic from Euston, King's Cross and St. Pancras Stations with much more impartiality than theirs. It utilised a mile and a half of existing roadway almost unaltered (in Camden Road and Kingsway), and avoided a mass of interference with sentimental and other interests by abandoning the hopeless attempt to get from Holborn Bars direct to the river.

As regards the question of architectural design in the streets themselves, the author deprecated any insistence upon uniformity of design on a large scale, referring to the failure of recent attempts to dispose of valuable frontage sites under conditions which debarred the free exercise of personal architectural wishes and commercial requirements. Individualism in street architecture in London was by no means unsuccessful. Our atmosphere, again, rendered ineffectual that long-drawn straightness and uniformity which in continental cities had an intrinsic merit. The author assumed, however, that if his or a similar scheme were eventually adopted certain points would be selected as demanding homogeneous and continuous design. For instance, the first departure from the Bayswater Road, the All Souls circle, the "place" opposite the British Museum, Russell Square, the bridge over the Thames and the viaduct over the Embankment, with their immediate approaches, would necessarily be committed each to an architect (not necessarily all to one man) for continuous connected treatment. If the proposed Traffic Board were appointed, it must certainly have as one of its chief duties the safeguarding and promoting of a concrete and definite plan of street improvement, and this could only be carried out in consultation with one or more who were architectural artists in the best sense. He suggested the appointment of an architectural adviser to the Board (or, if preferred, three architectural assessors); that the architectural adviser should not himself design any portion of the new streets, unless in the matter of bare plan; that for each building centre demanding continuous treatment a separate architect should be appointed, and that on no consideration whatever should individual license on the part of lessees or purchasers be allowed to prevail within the boundaries of such prescribed portions; finally, that on all parts of the new frontages perfect liberty of design and choice of architect should be allowed, subject to the control of the Board's architectural assessor or assessors, who should have absolute powers of censorship over all designs submitted. The author, in conclusion, pointed out some of the difficulties in the way of the Commissioners' projected device for crossing Piccadilly and put forward an alternative route.

Sir Melvill Beachcroft, L.C.C., proposed a vote of thanks to Mr. Waterhouse, though he said he was about the last person in the room who ought to undertake such a task. He had no special knowledge of the Traffic Commission. He was an old member of the London County Council, and one who had had the privilege of serving on the improvements committee of that body, especially during the period when they were considering the great scheme of Holborn to the Strand. He had also opposed the promotion of a scheme for a new thoroughfare from the Marble Arch to Whitechapel. He had listened with great interest to the instructive paper, and agreed with the author on many points. Mr. Waterhouse had rightly asked what they were to aim at in such a scheme, because in anticipation of any recommendation of the report of the Commission, it was desirable that they should be agreed as to the area of the improvement and the probable cost. He was afraid it would be some time before they should be able to deal with any such scheme, for he had heard that something like a sum of 25,000,000*l.* would be involved. He entirely agreed with what Mr. Waterhouse had said about surface tramways. Judged by the possibilities of the motor omnibus, they could not be sure that tramways in the future would occupy the streets of London. The question of the architectural treatment of all new streets was one of vital and imminent importance. Unfortunately there was no architectural minister to supervise building developments, but he earnestly hoped that in the event of any such scheme as that suggested in the paper being proposed there would be some authority that would have power over the architectural treatment of the streets.

Sir Geo. Bartley, K.C.B., who seconded the vote of thanks, said he could not enter into great length upon the report of the Traffic Commission. It must be remembered, however, that the subject the Commission had before them was the traffic of London, and although he agreed on many points with the paper, yet it was not, he thought, the business of the Commission to go into the architectural question very fully. He must defend the Commission when it was suggested that they had gone mad on the trams. The great problem the Commission was asked to consider was that of the rapid locomotion of people for business purposes; but while tramways offered a possible solution, he had in a supplementary report suggested the careful consideration of the motor omnibus. The scheme suggested in the paper would be an opportunity for making London more beautiful than it was, and the architects of England were advised to keep their attention upon such proposals.

Mr. H. H. Statham said he was really sorry to hear Mr. Waterhouse sum up rather against the idea of symmetry in the architectural treatment of those great streets, although he had mentioned that the treatment in continental cities had merit. The speaker believed that for a city to be dignified in the great thoroughfares there must be symmetry in the buildings, though improvements with that object in view might mean some sacrifice to property owners.

Mr. W. D. Caröe said it was rather characteristic of the feeling shown towards architecture in this country that the instructions furnished to the London Traffic Commission should not make the slightest reference to architecture.

On the motion of Professor Pite, seconded by Mr. G. W. Hudson, it was agreed to adjourn the discussion until the meeting of June 11.

The Chairman announced that Mr. G. A. T. Middleton had given notice of his intention to move at the next meeting "That the Council be instructed to consider the practicability of including all architects practising in the United Kingdom within the scope of the Institute."

THE ARCHITECTURAL ASSOCIATION.

THE members' dinner of the Association was held on Thursday evening, May 17, in the Georgian Hall, Gaiety Restaurant, Mr. E. Guy Dawber, president, in the chair.

Among those present were:—Messrs. Edwin T. Hall, Alexander Graham, Basil Champneys, Sir Henry Tanner, H. T. Hare, F. Hooper, J. Osborne Smith, W. H. Jamieson, J. Douglass Mathews, H. Tanner, jun., L. Ambler, A. Keen, F. T. W. Goldsmith, Owen Fleming, H. Lovegrove, T. C. Yates, L. W. Green, W. A. Pite, John Murray, Cole A. Adams, J. D. Crace, A. H. Ryan-Tenison, A. Bolton, E. M. Rüntz, Ernest Rüntz, F. Durrant, H. P. L. Cart, W. A. S. Pettit, D. A. Stephens, H. C. Willies, F. Yerbury, R. O. Bridger, C. Buck, H. A. Douglass, T. Campbell Pope, W. Wonnacott, F. J. O. Smith, Francis R. Taylor, G. H. Lovegrove, W. I. Travers, G. S. Mileham, H. J. West, A. E. Bullock, G. H. Jenkins, A. D. Leroy, G. C. Wilson, J. H. Squire, H. F. Waring, Alan Potter, A. N. Peckham, T. A.

Lodge, P. J. D. Webster, C. A. Farey, D. M. Wilson, E. Stanley Hall, C. Williams-Ellis, A. W. Earle, T. O. Foster, C. W. Ferrier, G. H. Paine, H. P. Gordon, W. Stewart, J. A. Payne, A. H. Belcher, J. Maclaren Ross, R. Douglas Wells, R. Dircks, Walter Cave, F. W. Marks, J. F. Bull, S. C. Arding, E. Carless, J. Gandy, F. E. Hulme, W. A. Forsyth, F. H. Atkinson, C. R. Webb, H. G. Tayler, H. Saffery, S. J. Tatchell, A. Huntley, W. G. B. Lewis, W. E. R. Randall, F. R. Betenson, Chas. Tanner, T. Frank Green, R. S. Balfour, G. McCredie, F. M. Elgood, W. L. Trant Brown, E. Greenop, H. P. G. Maule, W. Hatchard Smith, P. E. Webb, G. F. B. Daniell, G. Northover, G. Drysdale, R. F. Wheatly, S. Towse, C. R. Davy, E. Gunn, H. Coleman, C. Pond, F. Dare Clapham, E. J. Tanner, M. G. Pechell, K. Gammell, J. M. Kendall, Maurice E. Webb, P. W. Lovell, H. A. Hall, Stanley Hamp, H. Harden, H. Passmore, Frederic Upton, Courthope Munroe, F. J. Ronald, W. Leggatt, W Paul, Cyril Caudwell, H. J. Worrow, P. J. Westwood, E. G. Allen, J. Crowe, H. F. Saunders, and the secretary, Mr. D. G. Driver.

The toasts of "The King," "The Queen and Members of the Royal Family" having been honoured,

Mr. ARTHUR KEEN proposed "The Royal Institute of British Architects," making a brief speech because he assumed before such an assembly it was not necessary to say a great deal about that body. Indeed, he continued, the task of submitting such a toast was almost akin to proposing one's own health, so close were the relations of the Institute with the Association and so many present were members of both Institutions. He believed all whom he addressed were satisfied that the Institute represented the very best interests of the profession and strenuously endeavoured to do the best for architects. The Association itself was very much indebted to the Institute for the help that was always accorded to its work.

Mr. EDWIN T. HALL, as a humble member of the Institute, wished to thank the gathering for the way in which they had received the toast. He need not, he said, assure them that the Royal Institute had an earnest sympathy with everything that was done in the Association. The Institute realised the zeal of youth, and they hoped for that enthusiasm which was found among the members of the junior Society. It was only by that enthusiasm that they could ever hold their places and cope with the demands of the present day. There was one name (Mr. Maule's) which stood out as an able director of the Association's zeal. Mr. Maule and his assistants were keenly interested in all that was done in the schools, and all the young men who went through the Association course owed a very great debt of gratitude to the teaching staff. Those present would know that the Board of Education connected with the Institute took the greatest interest in the schools, and Sir Aston Webb, Mr. Basil Champneys and others had manifested their appreciation. They were also aware that lately the Board of Examiners at the Institute had decided that the four years' course in the day and night schools of the Association shall exempt students from the intermediate examination, and he believed that any change of rule which exempted men from examination would be popular. They had had exciting times lately at the Institute with regard to the proposed registration of architects. He hoped the Association would agree that the best register of an architect's capabilities was earnest work, and to that alone should a man owe any reputation that he might gain in the world.

Mr. A. RYAN-TENISON proposed "The Architectural Association," and alluded to the help afforded to it by those members who, notwithstanding a busy practice, devoted many hours to helping forward its students. Anyone who visited the classes and the day school and saw the progress made by the students must feel proud of the work undertaken by the presidents and the body of members generally. Enormous strides had been made in the training of the younger members of the profession, which must bring great benefits and advantages to architecture.

The PRESIDENT, replying to the toast, said he was not going to talk a lot of platitudes. They knew he appreciated the honour of being their president, but he would not like the opportunity to pass without telling them how deeply he felt the kindness and help of the Council of the Association both in the last year and the first year of his term of office. Without their help the duties of president would have been difficult to carry through successfully. He owed also a very deep debt of gratitude to the honorary secretaries and also the secretary, Mr. Driver. He sometimes thought that progress in a body like the Association when its affairs ran smoothly was comparable to travelling in a train, and those who sat comfortably inside were apt to forget the Driver. The position of the Association in the architectural world was so well established that he need say nothing about it. They were firmly established in their new buildings, every year their numbers were increasing, and every year, so he understood from their late secretary, they were progressing financially. He would not bore them with an account of the debt standing against the new premises, for it was practically wiped off. Educationally he thought the Association had progressed by leaps and bounds, and he believed they could now fairly claim to be not only the pioneer, but also the chief architectural teaching body in the whole country, and he was convinced that the work of their students was equal to that of any other educational department. Mr. Hall did his duty in mentioning the deep debt that they all owed to Mr. Maule, but he, the speaker, thought that they should not let the occasion pass without expressing their thanks to Mr. E. T. Green for the way he was conducting the evening school, and to their old friend, Mr. Lewis, for all that he had done to make the education what it was. He was very glad that they had established an athletic and social club, for he believed innovations of that kind would tend to the benefit of the members of the Association. He had little more to say except to introduce their new president. Mr. Balfour's work as an architect, of course, they knew, and also his work as a member of the Association. He was honorary secretary for four years, and he had been vice-president, and, as was hinted, he had that admirable adjunct of youth on his side, and they must feel that the welfare and honour of the Association would be well maintained. In conclusion, he would like to offer them his very hearty thanks for the pleasant two years he had had in presiding over the Association.

Mr. W. CAVE proposed the toast of "The Guests," for whom Professor Hulme briefly replied.

THE SOCIETY OF ARCHITECTS.

TWENTY-SEVEN sets of designs have been received from students of the Society in competition for the Travelling Studentship Competition, 1906, and the Council have placed first the design marked No. 6. The author is Mr. Victor H. Grist, 4 Marlboro' Avenue, Reading, who thus becomes the first holder of the Society's Travelling Studentship, which is of the value of 25*l.*, and carries with it the silver medal of the Society.

Some of the competitors considerably exceeded the limit of cost, and were disqualified on this account, but, in view of the number and general merit of the designs submitted, the Council have allocated a special prize of the value of 3*l.* 3*s.*, placed at its disposal by the president (Mr. Albert E. Pridmore), to the author of design No. 16, Mr. Alan G. Brace, Sunny Croft, Knowle, Warwickshire.

The following designs are considered worthy of special mention:—No. 12, Mr. Geoffrey Morland, 73 Morland Road Croydon; No. 13, Mr. Sydney G. Scales, 64 St. John's Road, Westcliff-on-Sea; No. 24, Mr. Robert O. Jackman, 27 Brunswick Road, Kingston Hill, S.W.

A public exhibition of the designs will be held on the Society's premises from May 28 to June 2, inclusive, from 10 A.M. to 8 P.M., to which admission will be free on presentation of visiting card.

Arrangements are also being made for the designs to be exhibited at Plymouth in due course. A detailed criticism of the drawings and a reproduction of the winning design will be published.

Thirteen candidates presented themselves for the competitive examination in architectural history and freehand drawing held on May 10, in London, with the result that the scholarship, which is of the value of 10*l.* per annum, tenable for three years, has been awarded by the Council to Mr. Harold Fletcher Frew, of the Gables, Tuffley, Gloucester.

The Haldane Travelling Scholarship, of the annual value of 50*l.*, has been awarded by the Haldane Trust to Allan D. Mainds, painting student of the Glasgow School of Art. There were three candidates—two painting students and one architectural student. The judges were Mr. Alexander Roche, R.S.A., Mr. R. M. G. Coventry, A.R.S.A., Mr. John Henderson, artist, and Mr. Alexander N. Paterson, M.A., architect. It has been decided that Mr. Mainds will visit the principal galleries in Italy and France.

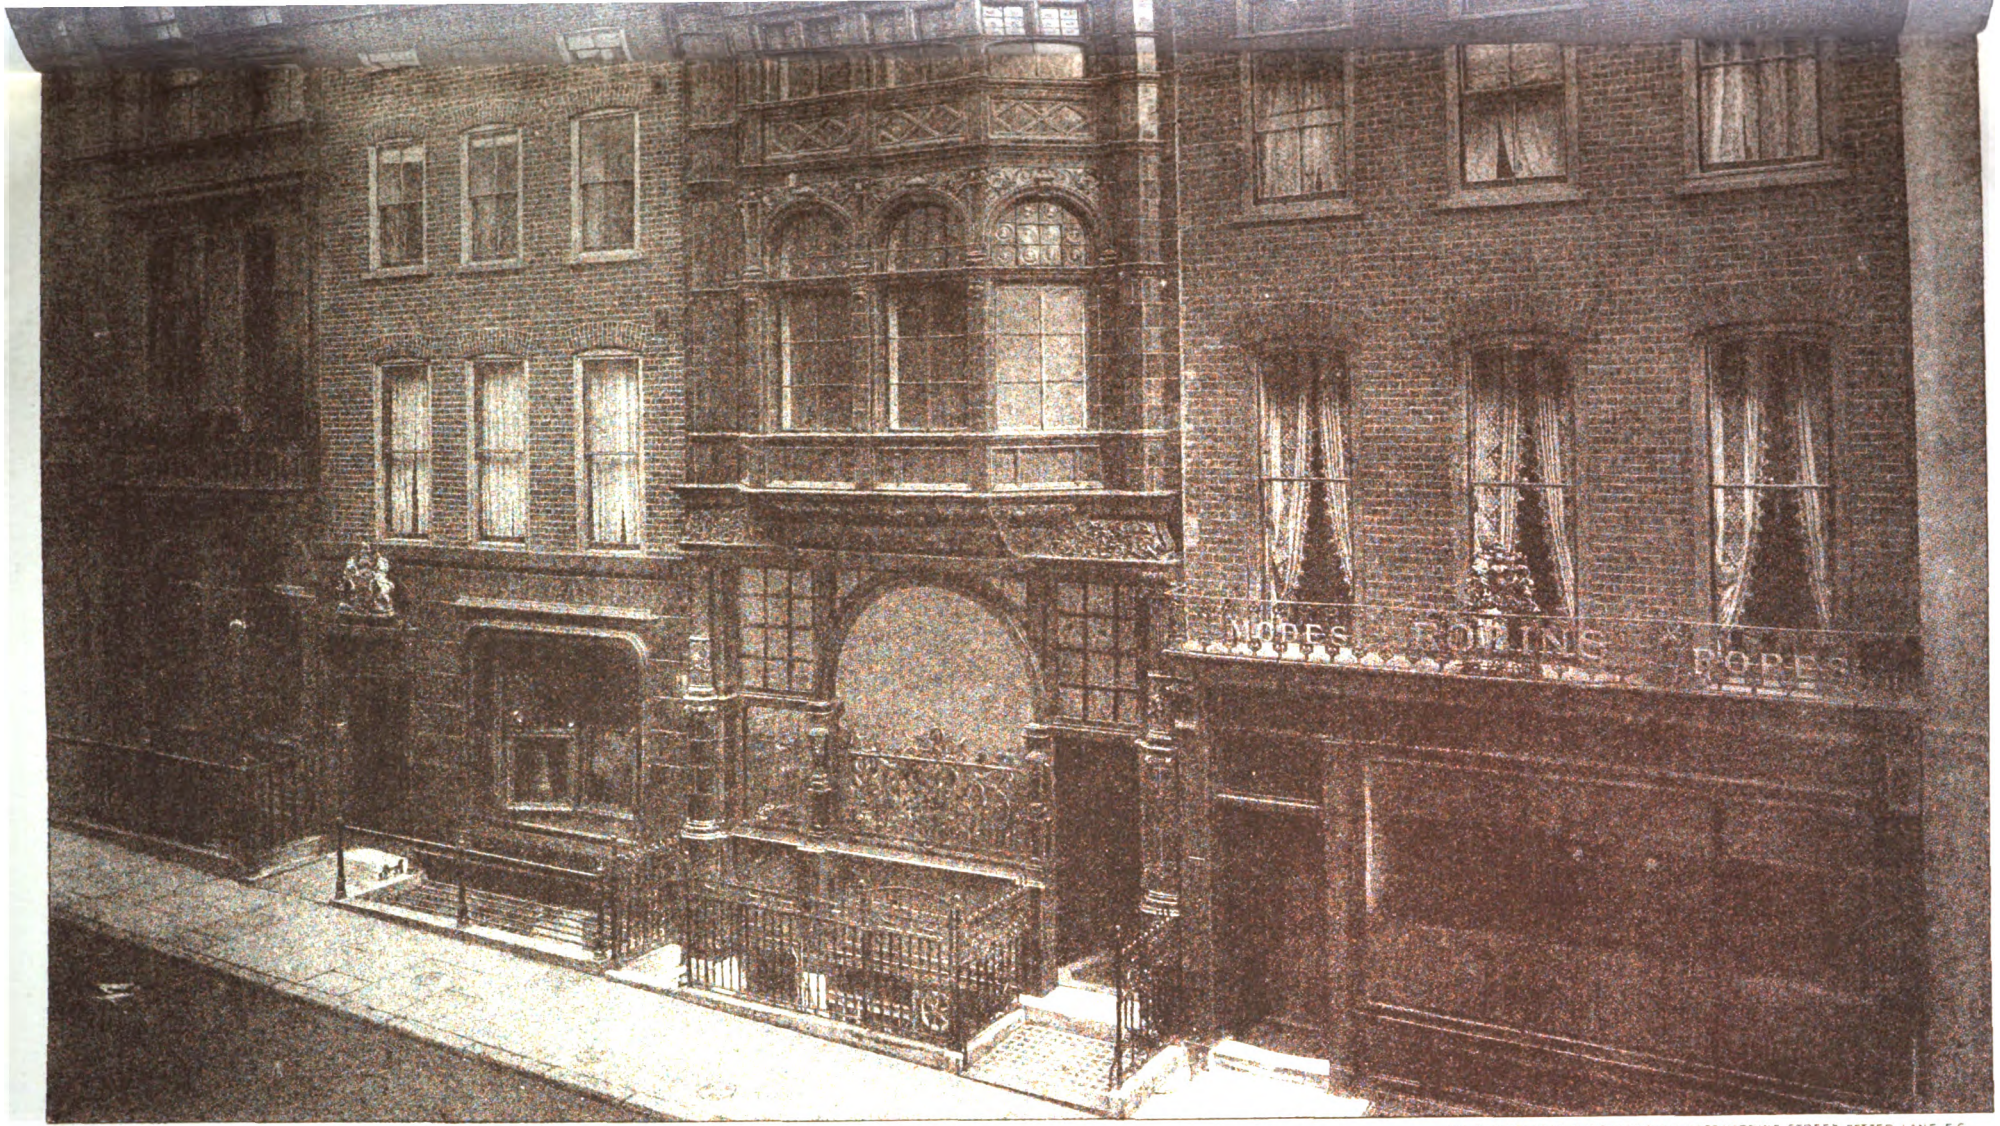
NOTES AND COMMENTS.

WATER is necessarily a precious commodity in the Metropolis, and the Metropolitan Water Board are expected to utilise the inadequate supply as profitably as they can. But it is one of the misfortunes of all departments possessing authority in England to insist on rigid rules to which there is to be no exception. A case which was heard on Monday, before Mr. FORDHAM at the North London Police Court, shows the inconvenience which rigidity of administration is likely to cause. Everyone connected with building in London is aware that each of the companies had a tariff for supplying water for different purposes, the amount being generally determined by the cost of the building about to be erected. Some companies preferred to charge according to the quantity which was determined by meter. It was the interest of the companies to facilitate building, for it meant the creation of new customers. There might be occasional grumbling, but as a rule disputes never found their way into the courts. A new system we fear is about to be introduced, if one may judge by the case which Mr. FORDHAM has decided. Mr. PAINE, a builder, having some land at Upper Clapton, desired to erect additional houses upon it. Accordingly he acted as he had done when the East London Water Company was in existence, and asked to be supplied with 25,000 gallons of water at the rate of ninepence per thousand. The water would cost 18*s.* 9*d.*, but he offered payment of 2*l.* 2*s.*, which would meet, as he thought, the expense of laying the supply from the main to the site. The Water Board declined to supply water by measure. They also stated that the builder was not the owner or occupier of any premises, and could only supply water on terms to be agreed upon by the company. Mr. FORDHAM decided that the land was premises, while at the same time it was land as distinct from buildings, and as such should be supplied by measure. He considered the sum offered by the builder as sufficient, and fined the Water Board in 40*s.* with 10*l.* 10*s.* costs. Whether the case will be brought to a higher Court has to be determined. But evidently the Water Board proposes to adopt the spirit inspiring Government Departments, and will endeavour to save trouble to the officials by raising obstacles to prevent the execution of works.

THE Birmingham School of Art continues to be remarkably successful. According to the report which was presented by Alderman KENRICK on Tuesday, the school for the fifteenth successive year has taken by far the largest number of awards. The success of the Vittoria Street school is very remarkable. The committee proposed to increase the accommodation at that school by the building of an additional storey over one of the existing rooms. The total cost of the room and its equipment will be 500*l.* The number of students is practically the same as in previous years. The enlargement of the art gallery will be undertaken in due time. Meanwhile, and in spite of the congestion, gifts and loans of works of art have to be recorded. Both the gallery and art schools testify to the interest which is taken in the progress of Birmingham not only by the Council, but also by the citizens in general.

THE decision given in the House of Lords a few days ago appears to indicate that there is little use in putting up notices about the risks of appliances, machinery, &c., as a precaution against accidents. In an engineer's factory at Gainsborough there was a goods hoist, and there was a notice on it that it was only to be used by workmen when in charge of goods. A joiner who wished to spare himself the trouble of walking to another floor entered the lift, and through some cause which is unknown he was injured and died. A claim was made under the Workmen's Compensation Act. The County Court Judge remembering that by the first section of the Act, "If it is proved that the injury to a workman is attributable to the serious and wilful misconduct of that workman, any compensation claimed in respect of that injury shall be disallowed," came to the conclusion that the joiner's death was due to neglect of the rule which was prepared for his guidance, and that neglect amounted to serious and wilful misconduct. A majority of the Court of Appeal took the same view. The case was brought before the House of Lords a few days ago. Lord ATKINSON had some doubt about allowing the appeal of the widow because of the man's neglect of a rule which should be rigidly enforced in factories. But the Lord Chancellor and a majority of their Lordships could not believe that the entry into the hoist was serious and wilful misconduct. That it was wilful there can be no question, and that all breaches of rules made for the safety of workmen are serious every business man would maintain. Apparently employers to be safe must have an overseer to look after all the actions of their workmen.

THE ground beneath Chicago has required great ingenuity on the part of architects and engineers in order to afford adequate foundations for lofty structures. It is to be hoped that permanency has been secured, but the defects discovered in the city hall are at least ominous. There has been so much alarm that it was necessary to appoint a commission to examine the building. Their report is not entirely reassuring, for they say:—"We find no evidence that the digging of the caissons has caused any damage to the building sufficiently serious to endanger its safety. The ceilings and walls of the sub-basement where the jail cells are located are badly cracked, and should be thoroughly gone over and repaired wherever necessary. Throughout the building the settlement has caused serious loosening of the plaster, the wood trimming and ornamental portions of the exterior stonework. This condition is now a menace to the occupants of the building and to the public passing it. All this work should be carefully gone over by competent persons and all loose material taken down at once." It must be allowed that the building has been regarded with suspicion from the time it was commenced. The piles for the foundations were arranged so close that when one was driven another was raised above the surface. The weight of the building was far from being uniform per square foot or per square yard, but the piers were all of similar dimensions. The building was no sooner completed than there was a settlement. In fact, the apprehension concerning the city hall had much to do with the revolution that took place in the manner of constructing foundations.



IT would be interesting to know whether there is any definite reason when one jury differs from another, especially in cases where new evidence is not introduced. A case was decided under Lord CAMPBELL'S Act last week which had previously been tried on two occasions, and in both the jury disagreed. The case was brought by a widow and her two children against Mr. T. L. GREEN, a builder, and she sought 500*l.* for the loss of her husband. The man was not employed by the builder, but by a sub-contractor for the heating, and while he was moving a radiator the floor gave way and he died from his injuries. It was said that the foreman of the defendant should have warned the man about the unsafe condition of the floor. The defendant said that he had not invited the man or engaged him; the accident was caused by the man's own negligence. Mr. Justice PHILLIMORE, having charged the jury, they awarded the widow 320*l.*, one child 120*l.* and another 60*l.* Judgment was entered for those amounts, with costs of the three trials. Cases of the kind do not improve the relations between contractors and sub-contractors. A builder's foreman generally takes it for granted that all the men employed by a sub-contractor are aware of the risks and know whether special precautions have to be taken in respect to weights. Compensation was certainly due to the family, but in this case, as in others it ought to be awarded on a more equitable basis.

COMPETITION DESIGN FOR WESLEYAN CONFERENCE HALL, WESTMINSTER.

WE illustrate the design and the ground and first-floor plans submitted in this competition by Messrs. ERNEST RÜNTZ & FORD, of 10 Walbrook, E.C. The main object in preparing the design was to impart a monumental character to the building to be erected. Other important characteristics were the safety of the public, simple and convenient planning and immunity from noise from street traffic as regards the large hall. As to the safety of the public, the requisitions of the authorities have been complied with, in view of the large congregations that would undoubtedly assemble on many occasions. A special feature is claimed in that the large hall and conference-hall are situated on the ground-floor level, thus enabling an arrangement of exits so as to give the maximum opportunity for a large gathering to get clear of the building in the shortest pos sible time in case of need. The arrangement of the remainder of the building is clearly denoted on the plans. The design is based upon strictly Classical lines, and it is claimed that the general grouping, particularly at the south-east corner facing Westminster, is of a monumental character and is a direct growth from the plan, which it is believed is simple and direct, thus leading to simplicity in treatment.

A YORKSHIRE GRANGE.

WE publish four photographic illustrations of a country house recently erected in North Yorkshire. The whole of the exterior walls with the exception of the chimney-stacks are finished in rough-cast with stone dressings, the roof being covered with dark Staffordshire tiles. Messrs. H. O. ARNOLD & SONS were the contractors. The building was completed in accordance with the contract, and the house was occupied within eighteen months of starting. The house was erected from designs of the architect, Mr. FRANK A. TUGWELL, Scarborough.

47 MADDOX STREET, W.

THE premises shown in the illustration may be considered as having a sort of historic interest, as the building is believed to have been the earliest in London in which faience was employed. The bay which was superseded only went as far as the first floor, and it was proposed to adopt a similar arrangement. Mainly through the efforts of the late Mr. BLASHILL, the projection was allowed to be extended. The whole of the faience was produced by the Leeds Fireclay Company, Burmantofts, Leeds. Mr. W. A. WILLIAMS, of Orpington, who was the architect, regularly visited the work in order to make sure that the modelling and colour realised his intentions. The basement and ground floor were arranged for business purposes, the top floor being a workshop communicating with the shop, the intervening floors being planned to serve as chambers or a club. It was also arranged that a hydrant could be fixed in the area at top of bay, in order to allow of the whole front being washed down whenever desired. The site was difficult to deal with, the frontage being only 18 feet 2 inches. The building cost about 11,000*l.*

INCORPORATED CHURCH BUILDING SOCIETY.

THE annual general court of the Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels was held at the Church House, Westminster, on the 17th inst. The Bishop of Southwark presided.

The annual report, read by the Rev. W. B. L. Hopkins, secretary, showed that the income of the Society for the year 1905 amounted to 16,168*l.*, as compared with 7,875*l.* for the year 1904. Ninety-four grants were made during the year amounting to 7,480*l.* Since the Society was formed in 1818, 8,900 grants have been made and a sum of 912,761*l.* distributed. The committee thanked the honorary consulting architects, who give their services so ungrudgingly to the Society by examining with the greatest care the designs submitted to them at their monthly meetings. By the recent death of Mr. J. P. Seddon, the Society loses an able and conscientious architect and the committee of architects their president and secretary. The total estimated cost of the works proposed to be executed in the year ending December 31, 1905, was 258,633*l.*, or rather more than 13*l.* for each additional sitting; the proportion of this sum which is to be devoted to the erection of the thirty-one new churches containing accommodation for 15,748 (free for 15,002) persons is 174,613*l.*, or about 11*l.* 1*s.* 8*d.* per sitting.

Mr. Temple Moore, in moving the adoption of the report, gave from an architect's point of view a few thoughts and suggestions on the relations between the hon. advising architects for the Society and the architects of the various proposed works. Now the work of the hon. advising architects might be thus defined:—To criticise and advise on plans submitted of works proposed—first, as to construction; secondly, as to convenience and suitability of arrangement; thirdly, as to architectural design; fourthly, as to restoration of ancient churches.

Sound construction should be well secured under the carefully drawn rules of the Society; rules which, while they tended to secure good permanent buildings, were not by any means prohibitive of economical work in the truest sense of the term. Convenience of arrangement was easily dealt with, requirements in this way being usually more or less alike, and this matter was as easily governed by rules as construction. When they came to architectural design and the restoration of old churches their task was not so easy.

He assumed that one of the objects of the Society was to raise the standard of design in church architecture, so that (so far as lay in their power) not only solid and suitable, but also architectural church buildings might become traditional of the work which passed through the Society's hands. It was obvious that no rules except of a general nature could be laid down on the subject of design, and hitherto the honorary advising architects had refrained from interference, except where the design had been flagrantly bad or unworthy. He felt, however, that they should no longer be content to leave the matter like that. He granted that design was, indeed, a matter of personal taste and preference, but there was a certain correct and appropriate feeling in design upon the broad lines of which, despite diverse personalities, their advising architects could agree. If the Society was to have any real influence towards the raising of the standard of church work in building, the honorary architects clearly must criticise the designing and make suggestions wherever such were felt to be needed.

He regretted that, generally speaking, the standard of design in the new church work brought before the Society's hon. architects was often very inferior, and did not appear to improve. Perhaps, after all, this was not very surprising, for in these days of hurry and many special architectural needs not known formerly, church design had become very largely a special branch of architecture. The busy general architect, though an able practitioner, had not the time, or, it may be, the opportunity to devote himself seriously to this study. Therefore he suggested that the hon. architects should, sitting as a committee for the purpose, criticise and make suggestions on the design outside the printed rules. It might be objected that his proposal would have the effect of discouraging originality or novelty in design, but he did not think so, for novelty, when good, had a certain recognisable appropriateness and fitness. It was only when it was a novelty for the sake of novelty that it became a defect.

He believed that in most cases architects whose training, experience and general practice had not been in church work especially would welcome the suggestions of the committee. He did not expect to produce good architecture by rules or by committees of experts; he only said that friendly criticism and practical suggestion on the subject of the designs from the hon. architects in committee would, he thought, in most cases produce a higher quality of work.

In schemes for restoration there was some improvement; the great importance of the more careful preservation of their ancient churches was generally beginning to be felt, but here again they had a special branch of architecture, requiring very much experience, which did not fall in the way of all architects. He considered that the rule of the Society which gave the advising architects power to ask one or more of the members to visit the proposed work should be more frequently exercised even in the case of less important churches. It was sometimes difficult to make any really useful suggestions by merely inspecting drawings or even photographs of the building in its actual state. In short, he proposed that the committee of architects should become more sympathetic advisers and helpers in the various schemes laid before them, not only as to construction and convenience, but also as to design, so that architects of prospective works would be encouraged to seek their advice and help.

In conclusion, if the hon. architects could be put into direct communication with the architects for the works it would materially assist the good understanding between them. He ventured to make these suggestions in view of the great importance of the work which the Society sought to promote, with the hope that they might point to a means of increasing its popularity and adding to its already considerable influence in helping to make their churches, whether in the restoration of ancient ones or in the building of new, in some measure more worthy of their sacred purpose.

THE LATE HERCULES BRABAZON.

THE death last week at Oaklands, near Battle, of Mr. Hercules Brabazon Brabazon has been almost unnoticed in the press of this country, yet, says the *Sussex Daily News*, he was one of the very few present-day artists to whom the word genius might be applied. Born eighty-four years ago, for many of them closely associated with Sussex, he worked solely for his own pleasure till 1892, when Mr. Sargent induced him to show at the Goupil Gallery some of those little dreams of colour which, by the hundred, had been hidden away in his portfolios, whence they were brought out occasionally to rejoice the spirit of a friend. Blake says that "he who kisses the joy as it flies, lives in eternity's sunrise." That was Brabazon's way. He was not of those who "bends to himself a joy" to the destruction of its winged life. A profound sincerity, an ardour for the inner kingdom of the beautiful, animated by light, was his constant quest. Nothing so puny as self-consciousness, self-distrust, quenched that ardour.

Digitized by Google

To the catalogue of the exhibition of 1892 Mr. Sargent prefixed a telling introductory note. It is one of the best, most understanding of appreciations, so that no excuse is needed for quoting it :—

The water-colour drawings of Mr. Brabazon are now being shown for the first time at the instance of the artists of his acquaintance, who have overborne his prerogative as an amateur of withholding them from general view. Their rare merit will be their best advocate, and any introduction of them by a member of the artistic profession is a formality of significance only to their author, to whom exhibiting is an adventure, for distinctions are lost when work attains a certain level. The exclusive following of a personal inspiration is admitted to be the condition of high professional work, and with talent such as Mr. Brabazon's this condition has led to a degree of excellence only to be found in work unhampered by adverse influences or victorious over them.

The gift of colour, together with an exquisite sensitiveness to impressions of nature, has here been the constant incentive, and the immunity from "picture" making has gone far to keep perception delicate and execution convincing. Each sketch is a new delight of harmony, and the harmonies are innumerable and unexpected, taken from nature, or, rather, imposed by her. Immediate sensations flower again in Mr. Brabazon's drawings with a swiftness that makes one for the first time forget that there has been a medium. Those who look principally for suggestions of nature in pictures will be grateful, and if they try to analyse will wonder whether the word lyrical, borrowed from other arts, would help to define a certain kind of temperament.

A French artist, on seeing some of these drawings, gave in a word another secret of their charm and of their power, "C'est la fin d'une vie." Only after years of the contemplation of nature can the process of selection become so sure an instinct; and a handling so spontaneous and so freed from the commonplaces of expression is final mastery, the result of long artistic training.

Since these words were written connoisseurs of catholic taste have recognised in Mr. Brabazon's spontaneities the breathings of genius. In a sense he remained an amateur to the end; in a sense he was the artist's artist. Had he gone through the ordinary art curriculum his sense of structural design might have been surer, but it is by no means improbable that the winged impulsiveness, the clarity of his vision — supreme possessions — would have suffered somewhat. He wooed nature, by virtue of an inward alchemy which was his by instinct; he recreated, showed forth in new glory and mystery and romance many of her secrets. Colour was his language, and he was sovereign over utterances innumerable. For one thing, wonder dwelt at the heart of all Brabazon's best drawings; and wonder is as a bird that, unsolicited, comes to nest in the heart of each who preserves even a little of the childlike spirit.

Mr. Brabazon has often been called the Father of the New English Art Club, at whose exhibitions his water-colour notes were a constant source of pleasure. But he was at once the father and the youngest son. At the convivial gatherings of the Club he was ever blithe and gay; it is not easy to forget the sweet temper with which in old age he confronted life. As recently as last autumn there were brought together in Regent Street over 100 of his water-colours and pastels, the final harvest from those portfolios to which nothing had been added for a decade or more. There was Venice seen across the floating dream of a Turner, Venice, "after Guardi," a masterpiece of interpretation, "The Church of the Jesuits," unfaltering of statement, and fugitive effects of atmosphere, eternal truths of sunlight and shadow, whether in violet-misted mountains or azure skies, or in welcome and intimate comments on De Hooch, Rembrandt, Rubens, Velasquez, Lawrence. He was far too big a man to be merely imitative. The one thing impossible to him was to be other than himself. How many can say that? His language of colour thrills with life; it was joy to him, so to speak. A final comment. The Chantrey trustees have so far overlooked the art of Mr. Brabazon. Let them hasten to retrieve their error.

The Old Grammar School at Coventry is to be repaired and enlarged. The building was originally the hospital of St. John the Baptist, founded by Edmund, Archdeacon of Coventry, in the reign of Henry II., and at the dissolution of monasteries granted to John Hale, a condition of such grant being that he should found "one ffree scole within the said cittie of Coventre."

AMERICAN PRACTICE.

IT is stated in the *Bulletin of the American Institute of Architects* that at a meeting of the board of directors the secretary was directed to send a letter to Mr. A. B. Trowbridge, in answer to a question as to whether it is proper for an architect to have an interest in building materials or contracts, stating that it is the opinion of the board that the Code of the Boston Society of Architects, articles No. 2 and 3, was the proper rule for guidance, and is as follows:—

Section 2. "A member having any ownership in any building material, device or invention, proposed to be used on work for which he is architect, should inform his employer of the fact of such ownership."

Section 3. "No member shall be a party to a building contract except as 'owner.'"

A letter was read in reference to modern albums of architecture by manufacturers, and illustrating such works with cuts of buildings of prominent architects. On motion it was carried that the chairman appoint a special committee to consider the subject of publishing architects' illustrations as advertisement, and also to consider cognate matters and report at the next meeting of the new board.

The following members have expressed their intention of attending the seventh International Congress of Architects. The expressed intention does not obligate anyone to attend:—Frank Miles Day, Cass Gilbert, W. B. Mundie, Charles F. McKim, Wm. S. Eames, Frank C. Baldwin and wife, Wm. M. Ellicott, Theo. C. Link and wife, Hugh Roberts, C. A. Wallingford, Josias Pennington, Geo. B. Post, Wm. C. Noland, Percy Ash and wife, Albert Kelsey, Alcide Chausse, Wm. B. Ittner, Robert C. Dixon, jun., John M. Carrere, Charles H. Rutan, C. Howard Walker, Geo. O. Totten, jun., August Wackerbarth, John D. Thomas, Chas. D. Maginnis, Isaac E. Ditmars, W. C. Whitney, J. Foster Warner, C. Edward Vosbury and E. W. Donn, jun. It is found after a careful canvass of the subject that it will be impossible to obtain reduced rates on any of the lines of steamers, and it will be necessary for each party to make his own arrangements with the steamship companies.

The following action has been taken by the Philadelphia Chapter in the matter of architects advertising:—Whereas there exists some indefiniteness and misunderstanding on the part of certain members of the Philadelphia Chapter of the American Institute of Architects with respect to the attitude of this Chapter towards the practice of advertising by its members, therefore be it resolved that this Chapter considers it injurious to its interests, and also to the interests of the architectural profession, for any member's name to appear in any paper, magazine or other publication otherwise than as a news item or as part of the general reading matter, of which advertising is not an intentional part in so far as the member, whether individually or as one of a firm, is concerned; that this Chapter considers it likewise injurious for any member to issue, print or publish, either as an individual or as one of a firm, any paper, pamphlet, book or other publication for which advertisements are solicited; and that this Chapter further considers the above-described acts as breaches of professional ethics.

At a meeting of the Illinois Chapter it was agreed to appoint a committee to take whatever steps might seem necessary to secure a law to permit the construction of entrances, cornices and other features of architectural adornment to project over the street line.

The subject was brought to the attention of the Chapter by Henry W. Hill. Mr. Hill recalled a decision of the Supreme Court prohibiting the occupancy of any part of the street or the projection of buildings upon the public thoroughfares. He thought it a mistake. He first proposed to appoint a committee to call upon Commissioner of Public Works Patterson and "enlighten" him as to the necessity of permitting ornamental features of buildings to extend over the sidewalk, but to this there was some protest because it would mean the violation of the recently adopted building ordinances. The members were in favour, however, of taking the matter before the Legislature to see if anything could be taken in that direction. In the Chapter the motion to appoint a committee to call upon the Commissioner of Public Works did not receive a seconder.

President Pond thought it unwise to do anything which might have a tendency to interfere with the enforcement of the law. L. E. Stanhope, deputy commissioner of buildings, said that the Department of Buildings had nothing to do with the question of the projection of buildings over the street line; that was a matter entirely within the scope of the Department of Public Works, he said.

It was stated in the general conversation which ensued

Digitized by Google

that the Department of Public Works is issuing notices to the effect that these projections will not be permitted, but their construction is proceeding at various places in the city, but no specific instances were cited.

S. A. Treat stated that in the construction of the building at Michigan Avenue and Thirty-first Street fifteen or twenty years ago, the park commissioners were so rigid in regard to the maintenance of the street line that it was necessary to set a building back 18 inches to permit of certain ornamental architectural features which had been proposed by the architect to be embodied in its construction.

Mr. Hill moved that a committee of three be appointed to take legal advice and to enjoin the Commissioner of Public Works from interfering with the construction of entrance features projecting over the street.

George Beaumont expressed the opinion that it was unwise for the Chapter to take up the matter of interfering with the building laws, as recently passed by the City Council. He stated that owners, architects and builders had been given opportunity to protest against any provision of which they did not approve, and they had in this, as in many other instances, not availed themselves of the privilege, and it would certainly be unbecoming in the architects to undertake any measures which had a tendency to invalidate the building laws. He cited instances in which he had found it necessary to erect buildings back from the lot line in order to attain certain ornamental features. He was opposed to the change in law on principle, and did not see why property owners had any right to trespass on the rights of others.

The following announcement has been sent out by the Colorado Chapter to the architects of Colorado, Wyoming and New Mexico :—

Sociability is one of the principal objects of this organisation. On this line alone many pleasures as well as benefits should accrue to architects visiting Denver for pleasure or business, as also for Denver architects visiting other points. Acquaintances and friends are not so apt to get in each other's way, and are glad to help one another in business matters. We promise for the Denver members of the Chapter, to the Denver visitor, the use of our offices, our desks, phones, circulars of information and our most gracious services in every way. As professional men we know what more this membership means, but we are also aware of the environments and conditions which often thwart our best intentions, and firmly believe that upon the foundation of sociability and true friendship will in due time be reared a symmetrical structure embodying all the true lines of professional ethics and the high standard that belongs to architecture in every sense.

FIRE-RESISTING SCENERY.

THE London County Council on March 1, 1904, included in the rules to be observed by licensees of premises licensed by the Council for public entertainments one requiring that "all scenery, wings, sky borders, cloths, draperies, gauze cloths, floral decorations, properties, hangings, curtains, &c., whether on the stage, in the auditorium, or in other parts of the premises, must be rendered and maintained non-inflammable." The Lord Chamberlain subsequently issued a similar rule with regard to the theatres in his jurisdiction. Before March 1904 it had only been necessary to render fire-resisting the hangings, curtains and draperies used in places of public entertainment, and not the scenery. It was hardly to be expected, in view of the considerable trouble and expense which it occasions theatre managers, that the rule made in March 1904 would at once meet with general acceptance, and until recently the reports by the chief officer of the fire-brigade of non-compliance with the rule were very numerous, more especially in the case of scenery brought into theatres by touring companies. The practice which is generally adopted for complying with the rule is to dip the lighter fabrics in a solution made from one or more of the chemical salts technically known as "antipyrenes" (ammonium phosphate, borax, alum, &c.) and as regards the scenery generally, to brush over the back of the canvas and woodwork with this solution.

The method adopted by the Council's officers for testing whether the scenery is fire-resisting is to obtain samples, selected at random in the presence of the manager, from the scenery to be tested, and to subject these samples at the headquarters of the fire brigade to the flame from a plumber's portable lamp, the temperature of the flame being about 1,000 deg. Fahr. If when subjected to this test the samples do not support flame the scenery is deemed to possess the requisite degree of resistance to fire. Complaints have been made from time to time to the Council and the Lord Chamberlain that the superficial treatment of the scenery with fire-resisting solution is of little if any use in making it fire-resisting, and it has been urged that only scenery formed of wood and canvas which has been thoroughly impregnated with fire-resisting solution should be allowed to be used in theatres and music-halls.

The theatres and music-halls committee have accordingly given careful consideration to the question whether it is necessary and practicable to insist upon the adoption of some more thorough method than is generally employed for rendering scenery fire-resisting, and to assist them in arriving at a decision on this point they arranged for the chief officer of the fire-brigade to submit in their presence to the usual test imposed by him samples of materials which had been treated with fire-resisting solution and similar portions of materials which had not been so treated. In all thirty-three tests were made, the articles tested consisting of scenery cloth, profile boards, wooden scenery battens, artificial flowers and palms, hay, straw, gauze cloths, muslin, chintz cloth, flannelette and linen.

As a result of the tests, the committee are of opinion that the degree of fire-resistance obtained by dipping light fabrics in the fire-resisting solutions usually employed is quite satisfactory, and that as regards the scenery generally the degree of safety that is attained by brushing over the back of the canvas and the woodwork with fire-resisting solution is all that can reasonably be required. It is therefore, in their opinion, unnecessary to insist that the woodwork and canvas of scenery which has been so treated should be thoroughly impregnated with fire-resisting solution.

It appeared probable, however, that as regards the canvas and woodwork of scenery which has only been treated superficially, the efficacy of the treatment might be impaired when the scenery was in constant use, but the committee are not in a position to form an opinion as to the extent of the deterioration likely to take place, or, consequently, as to the frequency with which scenery in constant use should be retreated. They have therefore instructed the chief officer of the fire-brigade to collect evidence on this point and to report thereon in six months' time.

THE SAN FRANCISCO EARTHQUAKE.

THE following communication from Professor Frank Soulé, dean of the College of Civil Engineering, University of California, appears in the *Engineering Record* :—

The recent great earthquake, and the only one of the series that caused any serious injury, began on the morning of April 18 at 5h. 13m. 38s., standard time of the 120th meridian. The duration of the severe part of the "quake" was 38 seconds, but the vibrations of the earth's crust continued for over a minute, and were followed at short intervals by many others of slight intensity. There were fourteen such recorded during the remainder of April 18, and more than forty have occurred up to the present time (April 30) ; none severe.

The motion in the first great shock was at first from east to west and finally from south-east to north-west, the displacement as measured by seismographs being about $\frac{3}{4}$ inch. The duplex instrument of the University of California gives a graphical representation, showing a large, somewhat tortuous, closed curve made during the vibrations, and indicates that the motions were from all directions at different moments, like those of the surface of a cake of jelly resting upon a plate, when the latter is severely struck. The severity of the first shock is estimated at nine in the Rossi-Forel scale by our seismic authorities.

The writer has visited and inspected some twenty-five of the principal large buildings and structures of the most modern type, as well as many others, and has ascertained the effects of the earthquake shock upon them previous to their attack by fire. In every case where the structure was of Class A, steel frame, with first-class foundations, either upon ground "in natural place" (as with the Claus Spreckels or Call Building, the James Flood Building, &c.) no appreciable injury was done, and but for the conflagration they would now be in service. The same can be said of that class of superstructures resting upon excellent foundations of piles driven through made ground to a solid substratum, as exemplified by the new Merchants'

Digitized by Google

Exchange, the Mills Building, the Kohl, formerly the Hayward, &c.

In the case of those of Class A, buildings founded on made soil, such as filled in sand, mud and the like, the walls have been cracked and injured to a considerable extent, requiring in some instances large expense for repairs. A notable example is the United States Post Office at the corner of Seventh and Mission streets. This is a handsome, well-designed and strongly-built structure of the new type, three storeys in height. Had it been raised upon an excellent foundation it would undoubtedly have passed through the "temblor" unharmed; but unfortunately for it, the site is a sand lot, across one corner of which formerly ran a branch of Mission Creek, underlaid by a deposit of mud and silt. The lot had long been filled into grade with sand, and the Government agents, after much adverse criticism of the subsoil, endeavoured to unify and strengthen the "bed of foundation" by the liberal use of steel-concrete piers. The granite walls on every side of the Post Office are badly cracked from the third storey under the roof to the foundations; while the walls, the marble veneer, the partitions and the fireproofing on the interior are badly shattered and thrown to the floor in great quantities. The sidewalks around the building are separated from it and each other, and upon the Mission Street side have in places sunk 3 feet below grade, indicating very plainly a defective support.

The total damage to this building is estimated at 100,000 dols., and is to be attributed to the defective foundation, the filled-in area, but not to the weakness of the superstructure; that in itself is strong and excellent.

The water front and sea wall of San Francisco lie far outside the old shore line of the harbour, and the intervening mud-flats and silt bottom between were at an early day in the history of the city filled in with rubbish and sand. Upon this material, sometimes using long piling, and at other times platforms and grillages of timber, a large number of the commercial and wholesale houses were erected. This "made ground" was greatly disturbed and rolled into waves by the earthquake, but wherever the piling under the brick or stone walls had been heavy, deep and well done there resulted little injury to the masonry.

The Union Ferry depôt at the foot of Market Street is a modern steel-frame building of great length and width, and has a very high tower at its middle on the landward side. The front and ends of the depôt and the lower two-thirds of the tower are faced with Colusa sandstone. The building is founded upon concrete arches and piers, resting upon timber grillages supported by wooden piles driven 80 feet into the silt, blue clay and yellow clay successively of the bay's bottom. There are seventy large piers with sixty piles each that carry the heaviest landward part of the depôt, thirty small piers with nine piles each under the light bay side, and 250 piles carrying the tower, which partly rests upon the seawall running beneath it. The foundation was regarded as heavy, substantial and sufficient even in this bay mud. The high tower was badly shaken and lost a part of its stone veneer, which falling upon the roof of the depôt, broke through it to the second storey or floor beneath it, and caused the greatest part of the damage to the building. The tower will probably be taken down and reconstructed. The south-eastern end of the wall of the depôt, the part first struck by the earthquake, was also cracked and in part thrown down, and some cracks appear in other portions of the structure, but no serious damage appears; the floors are apparently level and the depôt is in constant daily use.

This case of a heavy structure resting entirely upon concrete piers some 30 feet above their bases on piles in mud, and not reaching hard, solid bottom, seems a crucial test for the modern steel-frame structure, and indicates to the writer that the engineer and architect can build sufficiently strongly to defy any earthquake that is likely to come.

Other brick or stone buildings erected upon some of this filled-in area, but having weak foundations or thin walls were badly cracked, and in some instances completely wrecked.

The Palace Hotel, an immense structure of brick, seven storeys in height, built nearly thirty years ago, and therefore not in the latest type, e[illegible]od successfully the severe shock, as it had many a fi[illegible] in past years, but was gutted by the fire. It was [illegible] in a deep excavation in wet sand "in place," and w[illegible]nstructe with very thick walls of brick. It ha[illegible] bee[illegible]de[illegible]as both earthquake and fireproof.

The San Francis[illegible] was built in sections 1,000 feet or so in length. It was constructed, with the exception of the length under the Union Ferry, by excavating the soft mud of the bay's bottom to a depth of 34 feet and thus forming a long, broad trough in the stiff mud beneath, then filling this up to the desired level above high water with heavy random stone. Between this wall and the main land sand was dumped in to the same level. The wharves, with timber and latterly concrete or metal piling, have been established along its exterior face. This sea wall has been shaken by the "quake," and at some points has been changed in level, but apparently has suffered no serious injury.

Substantially built structures of wood resting upon good foundations in either natural or made ground have suffered no injury save as to chimneys and plastering, but flimsily-built houses on poor foundations have collapsed or been completely wrecked. The most remarkable instance of this kind is that of the Valencia Hotel, at the upper end of that street. It stood upon a deep filling of mud and sand. During the shake it dropped suddenly many feet into the earth, one side much deeper than the other, and doubled together like a jack-knife, the upper storeys lying upon the lower. The guests in the higher rooms escaped into the street, but twenty-five in the lower were buried alive.

As the result of study of the effects of this earthquake, the writer has the firm conviction that (1) the modern Class A steel-framed structure having a proper foundation will endure without appreciable injury any earthquake that is likely to occur. (2) That a strongly built wooden house on a good foundation bed will suffer little in any earthquake. (3) That wrought-iron shutters on the exterior of the windows of the great Class A steel-framed buildings in San Francisco, if operated by engineers and power, would have prevented the destruction by fire of a large number of her best designed and practically earthquake proof structures.

MERTHYR TYDFIL.

AMONG the principal towns Merthyr has the unenviable notoriety of having the highest death-rate. In 1905 the death-rate in England and Wales was lower than that of any other year on record, but in Merthyr it was higher than in the previous two years. The condition of the district has been made the subject of a report by Dr. J. Spencer Low to the Local Government Board. The following part relating to the houses occupied by the greater number of the inhabitants is enough to explain the position of Merthyr for defective sanitation:—

There are large areas in Merthyr and Dowlais which contain buildings unfit for human habitation by reason of their structural condition, their disposition in regard to other dwellings—as, for example, in crowded courts or because of their darkness, dampness, or other defects. Houses are to be seen (*a*) back-to-back, (*b*) back-to-earth, (*c*) without back doors and back windows—in all these types through ventilation is entirely absent—and (*d*) "under and over" houses, *i.e.* cellar dwellings with other buildings over them. Indeed, in the older portions of Dowlais and Merthyr well nigh every conceivable fault in housing is abundantly represented.

In a number of instances houses not fit for habitation have, at the instigation of the sanitary authority, been remodelled. For instance, back-to-back houses have been converted into "through" houses by combining the front and back house, or an "under and over" house has been furnished with an internal staircase giving access from the upper or "over" house to the cellar, the intention being that the latter should be no longer separately occupied. However, subletting of the cellar or of the back rooms of houses formerly back-to-back has resulted, in a number of instances, in the practical re-establishment of the previously existing unwholesome conditions.

A local type of insanitary dwelling has arisen by the erection of "slopes," *i.e.* of houses in juxtaposition with the backs of previously existing houses, so that by occlusion of back doors and back windows of the original house back-to-back houses are newly established. In part this has been due to a desire to make use of every available foot of building land in populous parts of the district.

Some instances of insanitary areas are here quoted as types of what can be readily seen throughout Merthyr and Dowlais.

Rosser Court, Glebeland.—Houses badly lighted, no through ventilation, roofs leaking, walls damp, upstairs rooms too low, no slop drainage, yard badly paved. Cross

Digitized by Google

Sunnybank Street and Llwyfen Street.—Houses back-to-back, others back-to-earth. Waterloo Street.—Houses with no back doors or back windows. Toop's Court.—Houses with no through ventilation, yard in filthy state. Moses Court.—Houses and yard in filthy state; some cellar dwellings. Company Row contains the most insanitary houses visited (with perhaps the exception of some in Well Street, Dowlais). These houses are build on sloping ground, and consist of three rooms, two above the ground level in front of the house (one on each storey), with a cellar beneath them. At the back of each dwelling all three rooms are above the ground level. Formerly this row consisted of "under and over" houses, but what was formerly a separate cellar dwelling has been made part of the "over" house by the construction of an interior staircase. By periodic and frequent inspections the subletting of these cellars is greatly discouraged, but in one instance I found the cellar sublet to an old woman at a rental of 1*s.* a week. The rental of the three rooms is commonly 1*l.* 2*s.* a month. Even in such houses the occupier endeavours to accommodate lodgers; as for instance by subdividing the kitchen so as to form from it a room just big enough to contain a bed serving as a place of rest for the husband—a night-worker—by day, and for the wife and family by night. In a particular instance where this had occurred the husband was found in bed, his wife and family occupying the rest of the kitchen and the cellar, while the remaining upstairs room of the house gave accommodation to a lodger's wife, who was ill in bed, having been on the day of my visit notified to be suffering from enteric fever.

The filthy condition of many houses and of many people inhabiting Company Row and Crystal Palace Court, which is in the same neighbourhood, is difficult to realise unless actually seen. It would seem that, however proper from a structural point of view may be the houses in which people of the class in question live, such persons tend in a very short time by their habits and mode of life to degrade their habitations. Their utter disregard for personal cleanliness, the squalor and overcrowding of their homes, their filthy habits, together with their lack of appreciation of light and fresh air, interact in a way to produce a slum whatever the type of dwellings they might happen to inhabit.

It is noteworthy that most of the dirtiest places that I saw in Merthyr and Dowlais were courts and back streets which are rarely traversed by the more respectable inhabitants of the district, public opinion being accordingly a matter which the inhabitants of such areas are not called on to consider. Like conditions obtain at Clive Street, Merthyr Vale, which is a row of "under and over" houses. The "over" houses here, which open on to a main street and are kept in a superior manner, are in marked contrast with the "under" houses which open on to a back road.

Apparently people of the class inhabiting Company Row, Crystal Palace Court, parts of Well Street and similar quarters are not likely to keep their persons, premises and surroundings clean except by being continuously harassed into so doing.

An interesting fact appeared while making house-to-house visits in Dowlais. After visiting a number of dirty houses I now and again came suddenly upon houses, not materially different in structure from the others, which were very well kept. Similarly, it became often obvious that the centre of the street divided a sanitary from an insanitary area. The cause of these contrasts would seem to be a difference in ownership; certain owners insist on their houses being kept clean, tenants on default being ejected. On account of the scarcity of houses in the district at a rental so low as 20*s.* per month landlords can pick and choose their tenants.

There can be no question that some houses in Merthyr are kept clean because the landlord insists upon it, and, conversely, that some are allowed to be dirty because the landlord does not take trouble in the matter. Well Street, Dowlais, and its neighbourhood, afford some good examples of the above state of affairs.

As I have said, few suitable houses are available at Merthyr for persons obtaining less than a certain weekly wage. Rents have a wide range in the district, and the quality of the accommodation obtainable for any given sum seems to vary in an extraordinary manner. A great want seems to be a three or four-roomed house rented at 15*s.* to 20*s.* per month. Owing to demand in this sense far exceeding the supply, persons have to take houses at a higher rental, and only by subletting rooms do they manage to live at a net rent which they can afford. It is a most difficult problem to provide suitable housing accommodation for such people. The packing of two families in one small house is not likely to be conducive to cleanliness or morality, and in the event of infectious disease attacking young children in one family the other family can hardly hope to escape infection.

The overcrowding which is common in the district, much enhanced by lack of suitable accommodation for single men, is often difficult to detect owing to the large number of men and boys engaged on night-work. A midnight visit reveals, of course, only the day workers, and a day visit on the following morning fails to discover overcrowding owing to the temporary dispersion of the night-workers to other houses for the time being. It commonly happens that some beds are almost never cold, the night-workers getting up but shortly before the day-workers retire to rest. As will easily be understood, promiscuous association of the sexes is inevitable in view of the circumstances under which many persons live in Merthyr.

In an attempt at dealing with the housing problem, the District Council, in addition to closing a number of houses permanently or until satisfactorily altered, have erected 100 houses which were occupied in 1903 and the early months of 1904. These houses contain in each instance two living rooms and a pantry upon the ground floor and three bedrooms upstairs, with water-closet and coal-house in the yard; each house has also a strip of garden. The rental of these houses is fixed at present at 22*s.* 6*d.* per month, which appears to be more than a large number of persons, at present housed in insanitary property, can afford to pay. A considerable portion of the population cannot afford 5*s.* 7½*d.* per week for the rent charged for the Council's houses. No difficulty has been experienced in filling the Council's houses, but subletting of rooms has been practised, with overcrowding as the almost inevitable result.

It deserves notice that accommodation as good as, and in some cases better than, that afforded by the Council's houses is to be had at less rent (when there are vacancies) in certain dwellings erected about the same time in the same neighbourhood by building societies. Houses in Bronheulog and Brynglas Streets, many of which are inhabited by persons paying rents of 20*s.* and 21*s.* per month, are instances.

As regards the Council's houses. When due allowance is made for the water charges (now reduced) and for non-recurring expenditure, I am given to understand that a house at a rental of 22*s.* 6*d.* per month returns a small profit. It must be borne in mind, however, that no charge is made for rent collection, which is effected weekly by the Council's rate collectors, who receive no additional remuneration for this service; whereas a house agent, I am informed, would require 5 per cent. on the rent for a weekly and 2½ per cent. for a monthly rent collection. With the present class of tenants in the Council's houses a weekly collection of rent is requisite. As the matter is now managed, the class of tenant housed by the District Council must continuously improve by selection, and by the elimination of bad payers, with consequent reduction of loss by empty houses and arrears of rent. From this point of view, most of the capital cost of the Council's houses may be recovered in thirty years, the period fixed for repayment of the bulk of the loan in regard of them.*

The conversion of insanitary property into houses fit for human habitation has been hampered by the fact that in a number of cases long leases are nearly at an end and the lessees are consequently unable to spend money profitably on such property. This applies to some of the houses owned by the coal companies; in one case I am informed that at present the company is losing money on its old houses, and that when the leases expire in a few years' time it will not seek to have them renewed. If this be so, sanitary houses may become even scarcer than they are at the present time.

Much cottage property is owned by speculators, so I am informed, who have bought at a low figure, and who are very unwilling to incur any expenditure whatever upon repairs or improvements. Locally it is not anticipated that such owners would spend much money on converting their insanitary property into something better.

There can be no question as to the chief want of Merthyr in the present. It is more abundant and better dwellings available for the working-class population. Were this want satisfied—whether by the District Council, the coal and iron

* 15,000*l.* was borrowed in the first instance to be repaid in thirty years. In the case of 2,047*l.* required to complete the work, the Board sanctioned the loan of this amount to be repaid in sixty years.

Digitized by Google

companies or by private enterprise—the following advantages would doubtless in due course accrue :—

(1) Disappearance of existing insanitary areas. (2) A reduced general death-rate. (3) A reduced infantile mortality rate. (4) A reduced rate of incidence and death from infectious diseases. (5) Increase of comfort and of enjoyment of life to a large section of the Merthyr population.

But as matters stand, though every house in Merthyr and Dowlais were to-day in a condition suitable for human habitation, there would still be most urgent need for many additional houses to cope with the prevalent overcrowding. Moreover, the position of affairs is more likely to get worse than to improve, in view of extensions now taking place at the Dowlais Ironworks. It is said that employment for an additional 1,000 men is likely to be afforded. It must be remembered in this connection that coal and iron companies own much house property in Merthyr and Dowlais, and that some of it is unfit for human habitation. If houses in this category are closed by the Council at any other than a very slow rate, the overcrowding evil must needs be intensified. I am informed, however, that in a number of instances houses have been rebuilt or otherwise improved at the Council's request.

It is possible that some of the difficulties of the housing problem might be met, and private enterprise perhaps at the same time encouraged, if the Town Council were to agree that they would take steps with a view to close houses in certain definable unhealthy areas at certain fixed dates, thus affording stimulus to provision beforehand of dwellings for the working classes to replace those to be closed by the Council as unfit for human habitation.

Similarly, it is worthy of consideration whether encouragement might not be given to the erection or provision of lodging-houses of a type somewhat superior to that of the average common lodging-house, in a way to relieve the congestion of young single-men lodgers in the houses of the working classes. As a further reason for such procedure, there is the circumstance that single men in this district are to a great extent employed in occupations rendering frequent and extensive ablutions desirable. These can with difficulty be decently obtained in lodgings in working-men's houses.

THE OLD ATHENS AND THE NEW.

AN interesting article by the Rev. James Burns, M.A., appears in the *Liverpool Courier*. He writes :— Leaning over the parapet of the Acropolis and looking down its precipitous sides one sees clustering around its base a heap of ruins, and beyond the streets of a modern city. This is the old Athens and the new—the old shrunken and decrepit, the new aggressively magnificent. It is this clash of the pathetic past with the noisy present which in Athens is the traveller's most startling experience. The Byzantine Athens, the Frankish Athens, the Turkish Athens have all disappeared. There is a gap in its architecture of 2,500 years, and walking under the shadow of the Acropolis one is now with Phidias in the Golden Age and the next in this aggressive twentieth century. It startles even the most prosaic to see tennis played near by the temple of Olympian Zeus and bicycle races run in the ancient Stadium.

It comes almost with a shock, too, to find Athens a city of boulevards and squares, of finely-built streets and fashionable shops. It is not what one has "come out for to see," and those things which elsewhere one would notice with admiration, here one regards almost with resentment. For modern Athens is painfully modern. Some seventy or eighty years ago it had not 200 houses; now it has a population of 150,000. It would be accounted a beautiful city if one had the patience to look at it, but the beauty one seeks for in Athens lies in its ruins, its broken pillars and empty fanes, its mighty and immortal past, and to wander amongst its tombs one seeks silence and peace.

Most people find travelling a long process of disillusionment. Things are so seldom as we have imagined them, and first impressions of scenes which our imagination has conjured up jar us by their unlikeness. Then there follows a process of reconstruction, and out of the ruins a better, because truer, impression is formed. Travelling in Greece is no exception to this rule. Cobden long ago found the waters of the Ilyssus—of which he had dreamed so long—dammed up by a washerwoman. Neither Marathon nor Salamis suggest anything heroic when at last the eye lights upon them. The land is rocky and barren, and one wonders what right poets and writers had to make so much out of so little. Then slowly there dawns upon the mind the overwhelming greatness of these men who made so much out of so little, who made Athens to thinkers and poets and artists what Jerusalem is to Christians and Mecca to the followers of Mahomet.

To many the most interesting and sacred spot in Athens is the Areopagus, or Mars Hill, from which Paul preached to the Athenians. Mars Hill is totally unlike what ninety-and-nine out of every hundred people would conceive it to be. It is not at all suited for a number of people to congregate; the summit is not grassy, nor is it flat; it is bare, rocky and precipitous. When one stands upon its summit the process of disillusionment is immediate; it is only gradually that the scene becomes reconstructed in the mind, and that the event takes on a new and thousandfold impressiveness. From no other spot in the world could one with Paul's training see so much that was enthralling. He could not have been human if, knowing what he did, and standing where he stood, his eye did not search for those places which even now cannot be reviewed without emotion. For there almost at his feet were the blue waves of the Mediterranean rolling up the Bay of Ægeria and lapping the shores of Salamis. Up that Gulf Xerxes, with his thousand ships, had sailed, their pennons fluttering in the breeze, their countless oars champing into foam the restless waves; and there on the high hill sat Xerxes on his silver throne, tearing his hair in an agony of rage as, entering the narrow straits, his ships were charged by the adventurous Greeks and thrown into confusion, until butting against each other in the narrow channel—

> The sea could scarce be seen,
> Strewn, as it was, with wrecks and carcases.

Nor less could Paul have been moved if, instead of letting his eye rest on the "wide-wayed sea," he turned inland. Beneath him rolled a broad and level plain shut in on one side by the hills of Hymettus, "where ever hum the countless bees," and on the other by Pentelicus, glistening with its treasures of white marble, and lying between them the way to Marathon. Along that ancient way ran Phidippides bearing the news to terror-stricken Athens, "Rejoice, we conquer," and, falling dead, made his name immortal.

The pride of modern Greeks in their illustrious ancestry is natural, and the philo-Hellenism which leads wealthy men to give generously to beautify their city receives the admiration of all. In the presence of this it is churlish to ask the question whether the Greeks of old and of to-day bear any relationship at all. It is like discussing the old question as to the boat of Theseus, which was repaired so often that men began to doubt whether it could be properly said that there was any boat of Theseus left. Such a question could never be discussed in Athens, where an attempt to translate the Scriptures into modern Greek would raise a riot. And perhaps the criticism that the weaknesses which the Athenians exhibited in Paul's day still remain is not without its truth. It has been said that if an Athenian had only one penny left he would spend half of it in getting his boots brushed, the other half in buying a newspaper. Politics is still the absorbing topic of conversation, and in politics the Athenians of to-day show the same fickleness as of old. In thirteen months there have fallen three Ministries, and in the next thirteen there will probably fall other three. And upon all this change, this coming and going of Ministries and of men, the grey old Acropolis looks down, with its broken pillars and pathetic ruins, more eloquent than all the speech of men of a past which can never be renewed, and of a glory which can neither be forgotten nor revived.

Mr. H. Craven, assistant to the town clerk of Sheffield, has been elected town clerk for York. Mr. Craven served his articles at Todmorden, and after holding positions at Dewsbury, Todmorden, Penrith and Rotherham, he went to Sheffield in 1900. He is thirty-eight years of age. The salary of his new position is 600*l.* a year.

The Water Committee of the Birmingham City Council have made an exhaustive estimate of the cost of completing the Elan Valley works which have been undertaken. In that estimate they have included the works at Hagley for the protection of the Great Western Railway, also an additional filtered water pool at Franckley, and a liberal allowance for certain adjuncts in the Elan Valley, and the committee are able to inform the Council that they can see their way to complete the first instalment of the scheme, including all these items, at a sum not exceeding the 1902 estimate of 5,884,918*l.*

Correspondence

The Cremona Society.

Sir,—That portion of the musical public which is interested in the subject of Cremona violins has been for a long time, if not always, under certain impressions (conveyed by tradition or assertions made by various writers or connoisseurs) that some of the best known masters of the craft in Cremona confined themselves to the making of one kind of instrument, the violin. Among these may be mentioned the name of Joseph Guarnerius, known as "Del Gesu," from his use of the sacred monogram "I. H. S." on some of the very few genuine tickets extant. It has long been asserted that he never made other than violins, his work in this line being that on which his great renown was built. Nevertheless, some few connoisseurs have doubted whether such a master of his art did no other work than make violins, or whether on starting business on his own account he produced examples of the three or four kinds of stringed instruments, viz. the violin, viola, violoncello and contrabass.

From time to time rumours have been abroad that some one "on the fiddle hunt" had come across a viola by the master, but these have been followed by a denial on the part of judges who have inspected the "find" that the most necessary evidence of his actual handiwork was apparent. Usually, the nearest that could be said was that the specimen, although after the style of Joseph Guarnerius, was by a different hand and lacked the essential evidence of his handiwork. With regard to the larger instruments, the violoncello and the contrabass, the hunt was looked upon as hopeless, for it was admitted that even if any were extant, their discernment would be difficult owing to the difference of size and likelihood of variation in design and manipulation from his renowned violins. The question of probability of Joseph Guarnerius having made violas or 'cellos has really been kept alive by the frequent interrogation of amateurs and others, who, having become acquainted with the violins produced by the great Cremonese, desired a 'cello or viola purchased, they rightly expecting that the wonderful qualities common to all his fiddle-work would be equally present in the larger productions.

Those interested in this matter will be pleased to know that an opportunity has at last arrived of settling the question in connection with at least one of the members of the violin family—a violoncello—and that a veritable example of Joseph Guarnerius's work, complete, has come to light in the freshest condition, and may be both seen and heard at a special meeting of the Cremona Society on Wednesday evening, May 30, when Mr. Horace Petherick, the president (whose work, "Joseph Guarnerius and his Master," is now in the Press), will read a paper on this undoubted Joseph Guarnerius violoncello.

Those who desire to be present should apply to me for tickets, which will be allotted so far as space permits.—Yours faithfully,

Albert H. Elliott,
Hon. Secretary.

7 Argyll Gallery, Argyll Street, W.:
May 21, 1906.

GENERAL.

The Empress Eugénie has given instructions that the furniture and other objects which formerly belonged to Malmaison are to be returned to that palace.

The Duke of Bedford was on Monday elected a trustee of the British Museum.

Messrs. Dixon & Potter have obtained the first prize in the competition for the Free Library, Bangor, and have been instructed to prepare working drawings and specification. Mr. V. Hodge, of Teddington, was awarded the second prize. There were twenty competitors.

A Collection of drawings illustrative of pre-Reformation painting in England has been arranged in the room next to the Raphael Cartoon Gallery at the Victoria and Albert Museum. They are mainly copies of wall-paintings in churches.

Mr. Sturge, London County Councillor, desires that the Council should take steps to obtain a coat of arms, "with a view to commemorating worthily its work in connection with public improvements, such as the construction of new streets and bridges, the restoration of ancient buildings and the like."

Mr. Max Clarke, F.R.I.B.A., has entered into partnership with Mr. Matt Garbutt, F.R.I.B.A., A.M.I.C.E., at present architect to the Metropolitan Railway Company, and the firm will be carried on as from June 1 as Max Clarke & Garbutt at 4 Queen Square, Bloomsbury, London, W.C.

The Town Council of Stirling on Monday decided to offer premiums amounting to 100*l.* for plans of new municipal buildings which can be erected at a cost of 12,000*l.* on a part of the site of the Corn Exchange.

The Annual General Meeting of the Surveyors' Institution, to receive the report of the Council and the announcement of the result of the election of officers for the ensuing year, will be held in the lecture hall on Monday, May 28, at 3 o'clock. The prizes awarded to successful candidates in connection with the recent preliminary and professional examinations will be presented by the President.

The Kent Archæological Society have fixed July 17, 18 and 19 for their visit to Canterbury. The Society will be received on the first day by Dean Wace, who will hold a reception in honour of their visit, and in the evening the mayor (Mr. F. Bennett-Goldney, F.S.A.) will entertain the members at a conversazione.

The Sheffield Society of Architects and Surveyors held their annual meeting on the 17th inst. The report of the Council showed a membership of 122, the highest number in the Society's record. A ballot was taken and the following gentlemen were elected officers:—President, E. Holmes; vice-president, W. C. Fenton; treasurer, F. Fowler; secretary, J. R. Wigfull.

The Corporation of Glasgow have purchased for the art galleries at Kelvingrove the full-length portrait of Mr. R. B. Cunninghame Graham by Mr. John Lavery, R.S.A., which is in the exhibition of the Royal Glasgow Institute of the Fine Arts in Sauchiehall Street.

Mr. Gavin Gemmell Dick, formerly resident engineer of the Queensland Government, London, and of 1 Victoria Street, Westminster, civil engineer, who died on May 23, 1905, left personal estate in the United Kingdom valued at 20,188*l.* 2*s.* 3*d.*

The Sewerage Committee of the Leeds Corporation have decided to recommend the City Council to adopt a new sewage scheme that will cost about 1,096,000*l.* Ground has been purchased near Templenewsam. The committee also decided to recommend the construction of an intercepting sewer at a cost of 163,000*l.*

Mr. Nigel Bond appeals as secretary of the National Trust for contributions towards 500*l.* still necessary to complete the purchase of Barrington Court, a Tudor mansion in Somerset. An anonymous donor some time ago gave 10,000*l.* for the purpose.

The Cambusnethan School Board, at a special meeting held at Wishaw, considered competitive plans by local architects of a new school for Newmains, to accommodate 900 scholars. A two-storey building was agreed upon, and a committee was appointed to fix upon a neutral architect of standing to adjudicate upon the four competitive plans, the estimated cost of the schools they represent being from 8,839*l.* to 9,545*l.*

Major Anstruther-Gray asked the First Commissioner of Works in the House of Commons on the 17th inst. whether his attention had been called to the state of the ceiling, painted by Rubens, in the Banqueting House, Whitehall, and whether he could see his way to have it cleaned. Mr. Harcourt in reply said:—"I have received very satisfactory reports from experts as to the general condition of the painted ceiling, but it undoubtedly wants cleaning and a renewal of the varnish, which I hope to be able to do at no distant date, though it may not be this year." It is about seventy years since it was cleaned.

The Birmingham Municipal School of Art invite candidates for the twenty-five free admissions to evening classes open to candidates under sixteen years of age, and awarded on the results of an examination in elementary drawing from objects thirty-four free admissions (including the ten "William Middlemore" and four "John Henry Chamberlain" free admissions) to the evening classes at the Central school open to students for not less than one session at the Central or branch schools; five exhibitions at 4*l.* each, without free admission, and tenable at the Central school or at the Victoria Street school for jewellers and silversmiths; five exhibitions at 6*l.* each, and five exhibitions of 10*l.* each, without free admission, and tenable in morning and afternoon classes at the Central school.

The Architect.

THE WEEK.

THE Avenue Theatre appears to have rather an ominous position. As a building it does not exist, and therefore no profit could be derived from theatrical performances which would be sufficient to pay the rent. But the property is subject to leases and sub-leases, and they, of course, represent heavy rents. In the lease of 1894 it was provided that if the premises were closed by order of a superior authority, or if they were destroyed by fire or damaged by fire to such an extent that they could not be used for performances, the payment of the rent was to be suspended. It was not anticipated at the time that the theatre would be rendered dangerous by the fall of a part of the adjoining Charing Cross station. The County Council issued a dangerous structure order directing that external walls and internal walls as described should be taken down. Two actions arose for the recovery of the rent under the leases, on the ground that as there was no fire or order by a superior authority, the payment of rent was not suspended. Mr. Justice LAWRANCE gave judgment in one action for 1,012*l.* 10*s.* and costs, and in the other for 750*l.* and costs. The defendants appealed, and the case came before the Supreme Court on Tuesday. The judgments of the Lords Justices suggest the doubts which arise in relation to such buildings. Although the appeals were allowed, it was only in an uncertain way. Lord Justice VAUGHAN WILLIAMS questioned whether the theatre by shoring or some other appliances might not have been put into a condition to receive people. Lord Justice STIRLING thought the theatre was not closed by a superior authority but by the collapse of the station wall. Lord Justice MOULTON was more assured, for he considered that superior authority of any kind was sufficient, and he did not think that fire alone was to be the cause of the damage which would prevent the payment of the rent. It is possible that the cases may be brought before the House of Lords.

THERE was some opposition at the meeting of the London County Council on Tuesday when it was proposed that the construction of a portion of the middle level sewer from Old Ford to Queen's Road, Shoreditch, and of a branch sewer to the high-level sewer, should be carried out by the works committee without the intervention of a contractor. The total outlay is estimated at 140,100*l.* Work of this kind may appear to be simpler than the erection of buildings to cost a similar sum. But plant will be required of a kind which the works committee do not, we believe, possess at present. It is of little use to argue that economy would be more likely to be secured by entrusting the work to one of the numerous contractors in London who have had special experience with such operations. The desire of the works committee or their willingness must be gratified at all costs. The extension of the main drainage system, of which the sewer in question is to be a part, is estimated to cost 3,772,550*l.* Originally the estimated cost was 3,000,000*l.* The large increase of three-quarters of a million suggests the contingencies which arise in dealing with sewers, and a still larger sum may eventually have to be paid.

IT is provided by Section 150 of the Public Health Act, 1875, that an urban authority may give notice to persons occupying premises abutting on a road requiring them to make up such road, provided that it is not a highway repairable by the inhabitants at large, and may, in the event of non-compliance with the notice, execute the works and recover from the persons in default the expenses so named. It has been decided, in the case of the Hornsey Corporation *v.* Birkbeck Freehold Land Society, that an urban authority can only exercise these powers over roads within the area of their own district. In this case the roadway and the footpath on the south side of the road were within the district of the Hornsey Corporation, but the footpath on the north side of the road was within the district of Friern Barnet. It was held therefore that the Hornsey Corporation could not recover the expenses of making up the road from the persons occupying premises on the north side of the road. As Lord ALVERSTONE, C.J., said, local authorities may be given powers to be exercised outside their districts, but it must clearly appear from the words of the Act of Parliament that such powers were intended to be given. In this case there was evidently no intention to confer such powers. In fact, the provisions which relate to the recovery of the expenses from the frontagers and the provisions which relate to the deposit of plans with the authority doing the work, favour the view that the local authority are dealing with local matters within their own district. If it were otherwise we should expect to find some provisions giving the other local authority some say in these matters. No doubt in such cases of roads within the districts of two local authorities the two authorities will be able to come to an agreement as to the performance of such work, and this appears to be obviously the proper course to pursue.

THERE has been more than the usual amount of talking about art in Ireland of late years. If we may judge by the report of the Art Union of Ireland, all the eloquence does not appear to have created abnormal outlay on works of art. Seven years ago the subscriptions amounted to 1,087*l.* This year the total has been reduced to 312*l.* 12*s.* 6*d.*, or less than a third. A still smaller sum was available for the purchase of pictures, viz. 180*l.*, the remainder being expended on administration. Somebody must profit by the Art Union, but few artists are in the number. In fact, only ten prizes could be distributed, one being of the value of 40*l.* The Irish Art Union may be contrasted with the Glasgow. This year the Scotsmen were able to distribute 2,260*l.* in prizes, one being of the value of 200*l.*, one of 100*l.*, five of 50*l.*, ten of 25*l.*, twenty-six of 20*l.*, twenty-six of 15*l.*, and thirty-nine of 10*l.* The difference between the two serves to explain why Glasgow should have a school of art which has a wide reputation, while in Ireland they are still endeavouring to discover the kind of models which would be serviceable to painters.

A BILL has been introduced in the American House of Representatives for the purpose of authorising the creation of a national advisory board on civic art. The five members are to be selected by the Senate and appointed by the President. Whenever called on by the State, the House of Representatives, the President, or a Cabinet officer, they are to consider and report their opinion concerning the artistic merit of plans proposed by legislative or administrative act for public structures, monuments and fountains, for the placing of mural paintings in public structures, or for the opening, modification or embellishment of any public space belonging to the United States. Any Government officer who is entrusted with the execution of Government work will be able to request the advisory board to consider and report concerning the artistic merits of plans for public structures, and for the opening, modification or embellishment of any public space within the district of Columbia proposed by legislative or administrative act. At least two meetings are to be held by the board each year in Washington, and an annual report with suggestions and recommendations is to be prepared. The sphere of the advisory board's activity is limited at first. But the new board will temporarily serve instead of a Ministry of Fine Arts.

SPANISH ARCHITECTURE.

THE alliance with Spain which is the event of the week may be the means of inducing Englishmen to take greater interest in Spanish art, and especially Spanish architecture, than hitherto. The reputation of VELASQUEZ has of late years exalted Spanish painting. But among the numerous Spanish architects there is not one who now stands on a similar level, although some men, like HERRERA, BERRUGUETE, EGOS, GOMIEL, etc., were in their time considered to be prodigies by their countrymen.

Spain to a great extent corresponds with England as respects architecture. It can show more Roman remains than are to be seen in our country, and the Romanesque is more suggestive of Byzantinm than Norman buildings. Spanish Gothic, like our own, is, however, an adaptation, and as much may be said of their Renaissance. The styles have been adapted to suit local circumstances. Spain has had, moreover, an advantage which we never possessed in England in coming under Moorish sway. But the style that we see in Granada and elsewhere is less pure than in Cairo and the East. In other words, there is not an essentially Spanish style.

FERGUSSON, who was one of those who believed that races rather than hybrids were the only creators, explained the puzzle of Spanish architecture by our ignorance of the origin of the people. It seemed to him extraordinary that with a soil and climate so favourable to architecture as in Spain the art should be only an exotic. But, as he says, "If we knew who the Spaniards were we might be able to explain these phenomena, but we know so little of the ethnography of Spain that at present this source of information is not available." The country was one which invited invaders. Phœnicians, Romans, Goths and Moors all found a place there. According to FERGUSSON, the Celtic element would have fused all those diverse elements into one. But it never prevailed in Spain. Yet, as we know from the recent republication of early Irish literature and poems, the Celts looked on themselves as emigrants from Spain, and there are traditions enough to show that for many years there was sympathy between Ireland and Iberia.

It must, however, be allowed that in the treatment of all the styles one peculiarity at least is visible. Stern and severe as the Spaniards were in character, they generally endeavoured to impart richness to architectural forms far beyond what might be considered native to them. They were profuse in ornament long before the Moors had arrived and set an example to them of avoiding plain surfaces. Even in secular buildings a similar peculiarity is seen. With all their pride the Spaniards allowed themselves to be subjected by governments and clergy to an extent which was unknown in other lands. But they found compensation for this by dwelling on the greatness of their families. Many of their residences were made to present the history of the owners through the aid of heraldry, and in that way there is a close alliance between the houses of the nobles and the churches. Indeed it would not be going too far to assert that something similar to the Plateresco or the Churriguersco at all times found favour among the Spaniards, although the architects who were supposed to have originated an excess of ornament lived in the Renaissance period. That kind of art found an almost unlimited field for its display in the retables of the churches as well as in the tabernacles and church plate. It is in our time difficult to decide whether it was the architect who designed the *instrumenta* or the goldsmith who designed the building. These treasures were tempting to invaders, for, as we know, one of WELLINGTON'S perplexities was the discovery of some means by which the French generals would have to yield the plate they had taken from the churches.

In England not much attention was given to Spanish architecture until Mr. STREET published his book on the Gothic architecture of Spain. His woodcuts have the great advantage of being rendered by a man who was not disposed to sacrifice characteristics to pictorial effect. It was found to be remarkable that the periods corresponded in age more nearly with England than with France or Italy. As the style was only an adaptation, foreign writers claim the works of their own country as inspiring the Spanish architects. The French are very positive about the connection between French cathedrals and Spanish, while Flemish and German inquirers are no less sure that their respective countries furnished the models. But the Spaniards had no hesitation in richly ornamenting parts which in other places were left plain. And the work is so often over-laboured, it is difficult to recognise what the building would be if the ornamentist were allowed less scope.

It is remarkable that in the history of Moorish architecture in Spain we can trace a similar exuberance, as if the air of Spain was favourable to the unlimited production of ornament. The Moors were unable to obtain a hold of the country without much fighting. Indeed some writers have said that nearly 4,000 battles had to be fought while the Moors remained in Spain. If we take the remains at Cordova and Toledo as evidence it would appear that the invaders, like the early Christians, did not disdain to utilise the cut stone which they found in Roman temples. The Moors had then some respect for consistency, and having massive columns and arches they were sparing in their decoration. Indeed, greater value was placed on the Cufic lettering which formed inscriptions than on any geometrically adapted figures. But, as we see in the Alcazar and the Mosque at Seville, the form of the arch was changed. The walls were divided into panels which were filled with elaborate ornament, and it would be impossible to find any relation between the delicate columns and those which were wrought by Roman masons. The ornament, too, has a distinct character, and testifies that a definite system was employed. Lastly, we find in the Alhambra that construction seems to be subservient to the decoration. Vaulting, which was supposed to require the highest skill, became a series of infinitesimal vaults, and we think less of the dome than of the countless pendentives of which it is made up, and which from the colours and gilding become bewildering. We can discover by the aid of analysis that the involved ornament is in reality made up of simple elements, but the first impressions which we receive are almost enough to make us believe that the whole of the work was due to "jins" rather than to ordinary workmen. It was in Spain that Moorish art reached its utmost bounds, and it was in Granada we can realise that its decline was approaching. Indeed, the boasting which the dome and the windows and other parts express in the inscriptions are suggestive of the pride which must have a fall.

It would perhaps be unsatisfactory to compare Spain to a museum. But for some aspects of architecture there is no part of Europe to surpass it. If there are a few buildings in Italy in which Paganism and Christianity seem combined, in Spain Mohammedanism has had to labour for Christianity. Minarets serve for belfries to summon people to church services. But Rome and ancient mythology are also recalled, for is it not inscribed on one of the gates of Seville—

> Hercules me edificó,
> Julio César me cercó
> De muros y torres altas,
> El rey santo me ganó
> Con Garci Perez de Vargas?

Traces of antiquity are to be found throughout Spain, not merely in ruins, but in the manners and customs of the people. For many a year Spain and England were enemies. But the circumstances of both countries have

Digitized by Google

altered. At one time the traveller seemed to think that the poorest Spaniard took airs on himself, and was eager the Englishman should bow to the native superiority. That, however, may be considered as a mere exaggeration. Foreigners now find they can travel throughout Spain and enjoy its sights with only a limited amount of inconvenience. We may also be allowed to hope that with the advent of the young queen there will be social reforms which Englishmen in particular will be able to appreciate.

THAMES BRIDGES.

THE opening of the new Vauxhall Bridge on Saturday is a metropolitan improvement which for some years past became a necessity. The influence of railway termini on London and on London life was originally not foreseen, and was not provided for. But it has grown to be very real and exacting. From the multiplex Victoria terminus it is now possible to go quickly to the northern, eastern and western parts of the Metropolis, or, in other words, those parts may be said to be united with the provincial districts which are served by three at least of the railway systems. But it was more difficult to reach the southern part of London from Victoria. Vauxhall Bridge at no time of its existence was adapted to connect two great highways. It was an early example of bridge construction in cast-iron, and it now seems difficult to understand how in the early part of the nineteenth-century people were induced to expend their money on such an enterprise. Pimlico did not exist, Tothill Fields seemed to be a desert, and the river and its banks were suggestive of gloom. That the neighbourhood was selected for the erection of the dismal penitentiary at Millbank is evidence of the character of the region. Indeed, Vauxhall Bridge seemed better adapted for a "Bridge of Sighs" than Blackfriars Bridge, and it is surprising it was not the scene of more suicides. Dismal as was the structure it cost 175,432*l.* to erect, and the Metropolitan Board of Works had to pay 255,000*l.* for it. The bridge which was opened on Saturday cost, including the property which had to be acquired, about half a million sterling.

We need not say much about the style of the new bridge as an example of architecture. But everyone will agree that it is well adapted for traffic, and that it has the advantage of presenting a horizontal roadway 80 feet wide. The County Council originally contemplated a bridge with granite facings and a backing of concrete. That would bring the structure into a close relationship with the noblest bridges of all time. But there arose some legal quibbles which could not be got over, and the work has therefore to consist of five steel arches varying from 130 feet 6 inches to 149 feet 7 inches. The abutments are, however, of granite and also the lower part of the piers.

Vauxhall Bridge represents the modern principle in bridge construction, which is that such works should be regarded in the same way as public roads, and be owned and paid for out of local rates. This may now seem to be very obvious, but it was for a long period unrecognised, and nowhere is that fact more clearly demonstrated than in London. Bridges over streams in England might be erected at the expense of the people in the vicinity. But large works which presented any difficulty could only be accomplished under extraordinary conditions. The legend of St. CHRISTOPHER suggests how old was the difficulty of conveying passengers from one side of a stream to another. Some of the monastic orders endeavoured to keep up the tradition, and went about begging for aid to build a bridge. Naturally they held the structure in their own hands and demanded tolls. The absence of legislation on the subject in England is evident when we find that it was not until 1531 that HENRY VIII. was able to pass the Statute of Bridges. Four justices were to hear and determine the "annoyances" of bridges and highways, and were to charge such as should repair them by sending forth processes and setting pains at their discretion. In case of doubt about precincts the bridges were to be repaired by the county, riding, or corporation. The justices were to appoint collectors to levy the taxes, and also surveyors who were to render an account upon pain of imprisonment without bail. That was a general Act; those of an earlier date related to particular bridges.

The Statute of Bridges had no effect in London. London Bridge was in 1531 a great massive structure of timber, and about thirty years afterwards it was necessary to cut down the drawbridge and to shut the gates in order to prevent WYATT and his followers from entering the City. It is well to remember that in those days a bridge might become a source of danger, and the citizens of London had reason to consider the Thames as a means of making the City inaccessible to enemies on one side. When STOWE wrote at the end of the sixteenth century, London Bridge was the only one which crossed the river and it continued so until the middle of the eighteenth century. He was rather proud of bridges, and he takes care to mention those which were to be seen within the City boundaries. There was Fleet Bridge, which was made or repaired by JOHN WELS, the mayor in 1431, for "on the coping is engraven WELS embraced by angels." There were also Old Bourne Bridge, which was also of stone, Cow Bridge, with others over the Tavern Ditch and over the Walbrooke. He refers to several enactments and orders by kings concerning the cleaning of the Walbrooke and the repair of the bridges. But works of that kind would be considered now as mere culverts.

We must not judge Old London, or rather the Metropolis, as it was by what it is. London Bridge served for communication with Southwark. But on the south side of the river where now there are almost countless houses the land was vacant. Then we must remember the existence of a company of watermen whose regulations made transit comparatively easy. In the time of Queen ANNE it is believed there were about 40,000 people who lived by boats. In 1734 there were nearly 6,000 wherries which were numbered and registered, in addition to those which were unregistered. The value of certain positions may be judged by the fact that the company received 13,650*l.* as compensation for the loss arising from the disuse of the Sunday ferry by the building of Blackfriars Bridge.

The watermen were not always civil, and they may have helped to convince people that bridges were indispensable. In 1735 and 1736 Acts were obtained for the construction of a bridge across the river at Westminster. CHARLES LABELYE, a Swiss architect, who had been assistant to HAWKESMOOR, obtained the commission. The first stone was laid in 1739. It had thirteen large arches and two small arches, all springing about 2 feet below low water. The length was 1,220 feet. Bridge building was a novelty to Londoners, and several drawings were made of the structure during its progress. LABELYE was supposed to have devised very ingenious centres, and plates of them were at one time familiar in books on building; but some of the arches failed, though whether through the centring or the foundations cannot be decided. The bridge was assumed to be connected with Parliament and a part of the funds came from the Exchequer. The bridge, apart from its danger, was out of keeping with the new Houses of Parliament. A new design with flat Gothic arches was therefore prepared by THOMAS PAGE, which was adopted after much opposition by engineers, and in 1862 the bridge, which had cost 400,000*l.*, was opened to the public.

Another eighteenth-century bridge was that of Blackfriars. It was the subject of a competition among the architects of the time. Nowadays handsome drawings would be supposed to have an influence on the decision. But JOHN GWYNNE, R.A., obtained the

Digitized by Google

services of Dr. JOHNSON in order to demonstrate that semicircular arches were preferable to semielliptical arches, which ROBERT MYLNE adopted and which it was known the Corporation had admired. The bridge might now find favour, for the columns which were introduced over the piers had, it was said, the proportions not of columns, but of candles. MYLNE intended using the best Portland stone to be found in the quarries, which were under the direction of the Lords of the Treasury. But by some of the juggling which was then common in the Legislature, stone of a different kind had to be used, and it was not long before repairs were necessary.

A new London Bridge was commenced in March 1824. With the exception of 200,000*l.* contributed by the Government, the two millions which were expended were raised by the Corporation. It is, however, remarkable, as indicating the peculiar condition which prevailed in the Metropolis, that all the bridges constructed during a great many years were financial speculations. There was no Act existing which allowed any of the vestries or other authorities to erect a bridge. CANOVA, who could not praise Westminster Abbey, although "il y a quelques beaux idées," is said to have considered the Strand Bridge (which is now known as Waterloo Bridge) as alone worth a journey to London, but was probably not aware, if he made use of the expression, which is doubtful, that he was praising the work of a company who had expended nearly a million before they were able to receive a penny toll. The Metropolitan Board of Works were afterwards able to obtain it for about one-half of the original outlay. Vauxhall Bridge, as we have said, was a little earlier in date.

The Hammersmith Suspension Bridge was erected under special Acts, and was opened in 1827. It was designed by Mr. W. T. CLARKE, and was supposed to represent a new principle. The total outlay was 85,000*l.*, but 112,000*l.* had to be paid for it. As traffic had increased the bridge was inadequate, and the superstructure had therefore to be changed in 1887. The appearance of the bridge was not, however, improved. When the Putney Bridge was opened in 1729 Putney and Fulham were outside the metropolitan boundaries. The bridge was formed of timber, and though it might be picturesque in the eyes of Mr. WHISTLER and other artists, it was certainly not adapted for a busy river like the Thames, for the immense piers formed obstructions. A sum of 58,000*l.* had to be paid for it, and a new bridge of granite was substituted, but in a different position. This, however, is becoming inadequate for the unexpected traffic.

The Lambeth Bridge, which was erected in 1862, was certainly the ugliest to be seen across the river. It was designed by P. W. BARLOW, the designer of the roof of St. Pancras station and many other structures. He was esteemed as an authority on the strength of materials, but the present condition of the bridge is not favourable to his prescience with regard to the wear and tear of ironwork. The bridge is now under observation, and it will have to be rebuilt as soon as possible. It was reported to be a profitable bridge to the shareholders, but they accepted a less price for it than it had cost. The Albert Bridge at the end of Oakley Street, which unites Chelsea and Battersea, was designed by Mr. ORDISH, who used to assist the BARLOWS. It cost about 200,000*l.*, and was supposed to unite the advantages of the cantilever and suspension principles. In appearance it was graceful, as architectural assistance was sought for the towers. When it was purchased the Metropolitan Board of Works expended some money on alterations. But it is to be hoped that if further changes are necessary the character of the bridge will be respected. It would, perhaps, be offensive to the official mind to suggest that the Department of Woods and Forests could speculate on a bridge. But the Chelsea Bridge, which leads to Battersea Park, was from the first intended to be a toll bridge. Only on Sundays and holidays was the roadway free. It was, however, provided in the Acts that if in some remote age hereafter the principal and interest were repaid by the tolls the bridge would become public property. The Metropolitan Board of Works anticipated the future by paying 75,000*l.* The bridge has also been strengthened, and it deserves some praise, for it is one of the few modern bridges in which an effort was made to distinguish it from an ordinary railway bridge.

Although there are so many means of communication across the Thames, it is found that the claims of commerce are not satisfied by them. Subways have also been constructed, and it cannot be said they are superfluities. Projects arise from time to time for additional bridges. In one sense this is satisfactory, for it suggests that, in spite of much inconvenience and other difficulties which impede intercourse, London is not satisfied with the creation of separate boroughs or parishes, but insists on unity, at least in a business sense. Pessimists have lamented its growth, but innumerable causes co-operate to enlarge its area, and with that object more facilities for communication must be created.

THE INTERNATIONAL CONGRESS OF ARCHITECTS.

THE following are some extracts from the provisional programme of the Congress :—

Meeting Places of the Congress.

The headquarters of the Congress will be at Grafton Galleries, Grafton Street, W. The inaugural meeting will take place at the Guildhall, E.C. Meetings will be held both at the Grafton Galleries and the premises of the Royal Institute of British Architects, 9 Conduit Street, W., for the discussion of the subjects of the programme.

Opening Day.

The Grafton Galleries will be open at ten o'clock on the morning of Monday, July 16, when the President will hold an informal reception. Badges, tickets for visits, &c., cards of invitation, will be obtainable at the Congress Bureau, Grafton Galleries. At 11.30 there will be a meeting of the permanent international committee. At three o'clock the inaugural meeting of the Congress will take place at the Guildhall, E.C., kindly placed at the disposal of the Congress by the Corporation of the City of London.

Receptions, &c.

The Royal Academy of Fine Arts will entertain the Congress at a soirée at Burlington House. The Right Hon. the Lord Mayor of London will entertain the Congress at a conversazione at the Mansion House on the evening of Tuesday, July 17 (limited to 1,000 invitations). The Royal Institute of British Architects will entertain the Congress at a garden fête at the Royal Botanic Society's gardens on the evening of Thursday, July 19. The Art Workers' Guild will entertain a small party of members on the evening of Friday, July 20. The chairman and directors of the London Exhibitions, Ltd., have put 500 invitations to visit the Imperial Royal Austrian Exhibition at Earl's Court at the disposal of the executive committee. Application for tickets must be made at the Congress Bureau, Grafton Galleries. The Zoological Society of London have kindly offered admission to foreign members to their gardens on Sundays, July 15 and 22—days when they are closed to the general public—on presentation of their cards of identity. The Royal Botanic Society have kindly offered members free admission to their gardens during the Congress week on presentation of their cards of identity. The Lyceum Club (for ladies) will constitute lady members of the Congress visiting London hon. members of the club. The Lyceum Club also kindly offers a reception to the Congress on the afternoon of Wednesday, July 18. The ladies' committee are arranging for the comfort and convenience of ladies. They will be recognisable by the committee badge.

Visits.

A. Hatfield.—The seat of the Marquis of Salisbury. Tuesday, 2.30. B. Hampton Court Palace.—Tuesday, 2.30. A and B are alternative visits, and will take place simultaneously. C. Buckingham Palace Gardens.—By the gracious consent of His Majesty King Edward VII.; and Westminster Abbey. Wednesday, 2.30. Later—D. The Works of Messrs. Holloway Brothers and E. The Potteries

Digitized by Google

of Messrs. Doulton & Co. These visits D and E will take place simultaneously. F. Windsor Castle.—By the gracious consent of His Majesty King Edward VII. Thursday, 2.30. G. St. Paul's, the Temple, the Institute of Chartered Accountants, St. Bartholomew's Church, Smithfield. Thursday, 2.30. This London visit is arranged for those who do not go to Windsor, as also alternative visits:—H. Kensington Palace; Dorchester House, by the kind consent of his Excellency the American Ambassador. J. Oxford.—All-day visit on Friday. Lunch in the halls of Exeter College and Balliol College. K. Cambridge.—All-day visit on Friday, alternative with Oxford. The Congress party will be received in the Senate House by the Master of Trinity as Deputy Vice-Chancellor. Lunch in the halls of King's College and Clare College. L. Tower of London.—Friday morning, for those who do not join the Oxford and Cambridge visit. M. Victoria and Albert Museum and Royal College of Science: Sir Aston Webb's new buildings. Friday afternoon, for those who do not join the Oxford and Cambridge visit. N. Bridgewater House. By the kind consent of the Right Hon. the Earl of Ellesmere. Saturday morning. O. Greenwich Hospital. Saturday afternoon. P. Houses of Parliament; the new Westminster Cathedral. Saturday afternoon, for those who do not join the Greenwich visit.

Farewell Banquet.

The farewell banquet will take place on the evening of Saturday, July 21, at the Hôtel Cecil, at 7.30. Price of ticket (wines included), 21s. It is hoped that many distinguished persons in London will be present. Sir Lawrence Alma-Tadema, R.A., has kindly consented to design the menu-card.

Exhibitions.

There will be the following exhibitions in the Congress premises, Grafton Galleries:—An exhibition of photographs of buildings executed by living British architects; a chronological exhibition of British architecture from the Norman Conquest (1066) to the death of Sir Charles Barry (1860); oil-paintings and water-colour drawings of English architecture; a few choice specimens of British furniture and silverwork. At the premises of the Architectural Association, 18 Tufton Street, Westminster, S.W., will be exhibited a selection of Viennese students' drawings arranged by Professor Otto Wagner (Vienna).

The subjects for discussion will be:—(1) The execution of important Government and municipal architectural work by salaried officials; (2) architectural copyright and the ownership of drawings; (3) steel and reinforced concrete construction; (4) the education of the public in architecture; (5) a statutory qualification for architects; (6) the architect craftsman—how far should the architect receive the theoretical and practical training of a craftsman? (7) the planning and laying-out of streets and open spaces in cities; (8) to what extent and in what sense should the architect have control over other artists or craftsmen in the completion of a national or public building? (9) the responsibilities of a Government in the conservation of national monuments; (10) the organisation of public international architectural competitions.

The executive committee have also arranged for Professor Meydenbauer, of Berlin, to read a paper on "Messbildverfahren" or "Photometry." A communication on this subject has also been received from M. Marcel le Tourneau, of Paris. M. Honoré Daumet (Paris) will read a communication on the Château de Saint-Germain. Mr. Cecil Smith (keeper of Greek and Roman antiquities, British Museum) will read a paper on "The Tomb of Agamemnon." Abstracts of the papers and communications will, if possible, be sent to members of the Congress some time before the opening day.

SUSSEX ARCHÆOLOGICAL SOCIETY.

A SPECIAL meeting of the Sussex Archæological Society was held at Lewes town hall on Friday. It was convened to "discuss the plans and estimated cost of building the proposed new library and museum in the 'Gun Garden' adjoining Lewes Castle," and the extent and representative nature of the attendance illustrated the importance attached to the subject by archæologists throughout the county. This fact was appreciated by no one more than the chairman (the Rev. Canon J. H. Cooper), who had taken the precaution to circularise the members on the subject, urging their presence in view of the importance of any decision to which the meeting might come.

The Chairman, says the *Sussex Daily News*, prefaced the discussion with a few details, which were supplemented by Mr. Reginald Blaker, in regard to the history of the problem to date. Briefly it may be stated that in 1903 the Society learned that the house at Lewes Castle, occupied for nearly twenty years, had been sold without any intimation being given to them, and the fact necessitated the provision of suitable premises elsewhere. In December of that year a committee was formed and, to secure for the Society access to the castle, what is now known as the "Gun Garden" was acquired. It was upon this site that a proposal to erect a museum and library gained favour in some quarters. Plans were prepared for a "simple two-storeyed building" containing a museum and a strong-room for valuable MSS., &c., on the ground floor and a well-lighted library and study above, with a convenient residence for a caretaker. The cost of this building, with necessary furniture, it was estimated, would probably reach if not exceed 3,000*l.* It was apparent to all who attended a general meeting of the Society last March that there was no unanimity of opinion on the subject, several of the members being averse to the erection of a building on the "Garden" site. On the question of expense, the Chairman mentioned that the Society now had a membership of several hundreds, and the subscriptions towards the estimated cost of the new project, given for two years, would not average more than 3*l.* or 4*l.* He emphasised the essentiality of securing access to the castle, supporting his contention, from a monetary point of view, by mentioning that something like 150*l.* per annum was derived from fees for admission paid by visitors, though last year, he added, he believed there were 200 less visitors than the year before, in consequence of the museum's removal, and they only took 113*l.* The Society, he added, had a valuable museum, but it was housed very badly in, he might almost say, a "damp, dim and dreary dungeon" in the castle, and they really needed other accommodation. They wanted to make the library and museum attractive, not only for the present, but for the future. If they had a strong room he believed they would have antiquities, manuscript charters, manor rolls and so on sent to them from all parts of the county. He hoped the scheme would be the means of drawing the Society closer together and increasing its popularity and usefulness. He thought credit should be given to the sites committee for having acted with the best motives and in a manner which, in their opinion, would be of service to the Society.

The Rev. W. Hudson moved "That the plans and estimates now submitted be approved, and that the Council be requested to proceed with the work." This was seconded by Mr. Salzmann, and a lengthy discussion ensued.

Mr. C. E. Clayton said it was exceedingly difficult to give credit to a member of the committee who was instrumental in turning the Society out of its former house. He passed that remark, he said, in view of the chairman's observation that they should give credit to the committee for acting with the best motives. The speaker described the proposal to erect a building on the "Gun Garden" site as "an act of vandalism of a monstrous and extraordinary nature." He asked the members to record in the most unmistakable manner their opinion that to erect any building whatever, even if were to be only the height of a chair, in the "Gun Garden" was a distinct error, not only of judgment, but one of those things that no archæological society should countenance. He did not think as many as fifty members would offer a subscription to defray the cost if that scheme was carried into effect. So far as the library was concerned he criticised its arrangement. It was, he remarked, uncatalogued and difficult to consult.

A member elicited the fact that the castle was held on a yearly tenancy, and expressed the opinion that it might be absolutely useless to secure access to the building by the "Gun Garden" site on a lease of ninety-nine years, unless the Society obtained a tenure of the castle for an equivalent term.

Mr. Griffith mentioned for the information of the meeting that the feeling on the part of members of the Council in regard to the proposal had been strongly and distinctly divided from the first. There were, he added, three questions probably in the minds of everyone present that day, viz., should they or should they not adopt the proposal, and assuming that they did not use the "Gun Garden" site for the building, what was to happen? He thought the meeting should consider the first two questions, and in the event of a decision against the proposal, leave the third question to the careful consideration of the Council, to be

Digitized by Google

reported upon fully at the next general business meeting of the Society.

Mr. Garraway Rice stated that at first his mind was made up that it was a useful proposal. He was, however, anxious to hear the arguments of other members of the Society, the Council, he was sure, being in no way anxious to run into this "Gun Garden" scheme in the teeth of any *bonâ-fide* opposition.

Mr. De Paris said (presuming for the moment that the scheme was favoured):—"You will lose your prestige and you will also lose a number of members who probably prefer that the Society should belong to Lewes, and who would not care one jot for that Society if it were removed to a modern town." He opposed the scheme on the ground that a view of the ancient gateway would be obstructed in a manner that would be to the detriment of the antique interest of the castle remains. He thought, moreover, that the site under notice would prove damp, and he could not see his way to vote in favour of its use for the locale of the Society's museum and library. There were other places in Lewes, he said, which presented more favourable conditions, and he suggested, as an instance, what is known as Anne of Cleves's house, in Southover, which, he said, stood on high ground and was suitable for the purpose.

Mr. Bentham Stevens considered the Council had tried to kill two birds with one stone, by securing access to the castle *via* the "Gun Garden" site, and by proposing to erect thereon the library and museum. In doing so, however, he maintained that they had made a great mistake. He thought that a suitable site for the latter purpose could be obtained in Lewes or elsewhere.

Mr. Harry Willett, who lives in close proximity to the castle, opposed the proposal from an archæological point of view, and also from that of the public, who probably had no wish to see a modern building erected under the ancient walls.

Mr. Aubrey Hillman, J.P., corrected a previous speaker in regard to the elevation of Anne of Cleves's house, which, he said, stood on ground about 25 feet above sea-level, whereas the elevation of the "Gun Garden" was between 80 and 100 feet.

Mr. Bedford contended that the Society should remain "wholly and solely" at Lewes, but he opposed the "Gun Garden" scheme.

With reference to Anne of Cleves's house, Southover, the Mayor of Lewes mentioned that he had received a letter from Mr. Frank Verrall, who heard the matter from the *Sussex Daily News*, in which the writer stated that he would be pleased to contribute 100*l.* towards the purchase of the house, if that course was decided upon.

Mr. Runtz sought information as to how the Society would stand in regard to the conditions of the lease in the event of the meeting deciding not to erect the building on the "Gun Garden" site. Shall we, he asked, be bound to spend 750*l.* on some other building if we do not erect a museum on the ground?

The Hon. Secretary: The lease does throw upon us the liability to build.

It subsequently transpired that the lease had been signed, but Mr. Griffith explained that the Society had not yet taken the lease.

Mr. Runtz: Are we not bound to take it up?

Mr. Griffiths: We might be, in honour.

Mr. Runtz spoke of the increased interest that had been evinced in the doings of the Society as the result of the publication of so many letters on the "Gun Garden" scheme in the press.

The Chairman then asked for a show of hands on the motion.

No one supported the proposal, and it was rejected by what appeared to be an almost unanimous vote.

Subsequently Mr. Griffith proposed the following resolution:—

"That the Council be requested to make inquiries into the best method of making the library and collection of prints and collections belonging to the Society conveniently available for the members, without undue expense to the Society, and report to the first general meeting to be held next year."

Mr. Somers Clarke seconded, whereupon Mr. Aubrey Hillman moved as an amendment the insertion of the words, "at a site in Lewes," in the resolution, to follow the phrase "conveniently available." He maintained that they should keep the library at Lewes and prevent it going to Brighton.

On the other hand, the Rev. J. P. Bacon Phillips strongly advocated the removal of the locale of the library to Brighton.

Alderman Wightman, who seconded the amendment, impressed upon the meeting that Lewes was more suitable than Brighton for the library of the Society.

The amendment was carried, and the resolution, as altered, adopted.

THE SURVEYORS' INSTITUTION.

THE members of the Surveyors' Institution met in conference in Birmingham on May 25. The Corporation placed the Council House at the disposal of the visitors, and before the formal proceedings of the conference were entered upon the members were cordially welcomed to the city by the Lord Mayor (Councillor A. J. Reynolds). The chair was occupied by the president, Mr. Charles Bidwell, of Ely.

The Growth of Birmingham.

The first paper read was by Mr. H. A. Pritchard (deputy town clerk) on "The History and Development of Birmingham," in which, says the *Birmingham Daily Post*, he gave an interesting but necessarily brief account of the growth of Birmingham from a humble hamlet to a world-famed industrial centre. From the hamlet to the village community, concluded Mr. Pritchard, from the village community to the country town, and from the country town to the populous city, they found Birmingham in the early years of the twentieth century the metropolis of the Midlands, and one of four of England's greatest provincial towns. The centre of a large and populous district she embraced within her own boundaries a population of 543,000 inhabitants, the results of whose industry found a market throughout the world. A glance at her local history, however, illustrated that the records of her principal citizens formed the chief factor in her success and development. A Birmingham man had been described as "of strong individuality, independence of character, facility of resource, and with an enduring love for the old town." The city had not attained her present wealth, dignity and importance except by the efforts of her leading men. Each in his different sphere had influenced her progress—from Boulton the resourceful manufacturer, Watt the inventor, Baskerville, Priestley, Scholefield, Attwood the reformer, and many others to the present senior member for the city, whose early public life and administrative genius were devoted to her welfare with such marked success and fruitful results.

Economic Geology of the Birmingham Country.

Professor C. Lapworth followed with a remarkably interesting paper, from which it appeared that had it not been for certain geological movements the Birmingham of to-day would have been a very different place from that described by Mr. Pritchard. In the course of his address on "The Economic Geology of the Birmingham Country," Professor Lapworth said the solid floor of the district, like that of every other extended area in Britain, was formed by the edges of the massive rock-sheets that constituted the so-called geological formations. Omitting the complicated little area of the Lickey Hills, there were seven of these formations. If these seven rock-sheets had remained horizontal, as they were originally deposited, the strata of the highest formation, those of the keuper marl, would to-day have formed a gently undulating lowland like that of Central Warwickshire. The mineral riches of the coal and iron beds of the South Staffordshire coalfield would have remained undiscovered, buried half a mile deep below the surface of the ground. The Birmingham country, instead of being what it was at present, a land remarkably varied in its scenery and productions, inhabited by a teeming manufacturing and mining population, collected in great towns and in the van of industry and progress, might have been a monotonous agricultural region, with a scanty population gathered here and there into quiet little villages—a country peaceful and picturesque it might be, but without progress and almost without a history. But, providentially, the great rock-sheets had not remained horizontal. They had been bent up in the western parts of the district into the domelike form which was termed the Staffordshire arch, and warped down in the eastern parts into the basin-like form called the Warwickshire trough. They had been broken across and dislocated by the two great crust fractures, which they knew as the western and eastern boundary faults of the South Staffordshire coalfield, and also by a third great fracture, the Birmingham fault, which ran through the city itself. Professor

Digitized by Google

Lapworth described in detail the various geological formations.

Mr. Charles Vernon, in proposing a vote of thanks to Professor Lapworth, referred to the geological advice to surveyors contained in his paper. He said the whole world had had a terrible lesson in geology, and they wanted to know more of the interior of the earth if they were to avoid the dangers of Naples and San Francisco.

Mr. Gilpin Brown, chairman of the Warwick and Worcester provincial committee, seconded the resolution, and it was carried.

Professor Lapworth, acknowledging the resolution, said geology was regarded as a mysterious science, but the riches of Birmingham and the Black Country were questions of geology; in fact, they might say in a general way that geology was at the base of everything.

Legislation and Real Estate.

Mr. John Willmot read a paper on "Proposed Legislation affecting Real Estate," in which he gave a short epitome of the following Bills:—The Land Valuation (Scotland) Bill, the Public Health Acts Amendment Bill, the Housing of the Working Classes Act Amendment Bill and the Land Tenure Bill. Dealing with the second named Bill, Mr. Wilmot said that in considering the revision of by-laws they would agree with him that due provision should be made to insure that only such houses were erected as would provide sanitary and wholesome dwellings. This would still be possible even if by-laws were relaxed so as to permit of the use of various kinds of materials in the erection of buildings. He believed that the by-laws should prescribe a minimum size and height for rooms, and the proportion which the area of the window should bear to the floor space. The revision of by-laws on the above lines would admit of the erection of cheaper houses, which would naturally tend to an increase in the building of cottages, and in some rural districts would be of great assistance in keeping the agricultural population upon the land. The remedy for overcrowding in urban districts was, he believed, to a great extent within the power of the local authorities themselves, and the difficulty could be met by relaxing the by-laws as to the construction of new streets. In agreeing to the construction of less expensive roads, the local authorities might reasonably stipulate for a certain area of land to be allotted to each house. If this were done he felt sure a great step would be taken towards the provision of healthy and wholesome houses for working men at a reasonable cost on the outskirts of the great centres of population, where they were often at the present time so urgently required. But so long as the existing cast-iron rules were applied to the construction of all roads, so long would the difficulty of providing cheap and healthy houses for working men continue. The whole question of building by-laws and by-laws relating to the construction of new streets was a matter which might with advantage be dealt with in a Bill to be introduced by the Government, the provisions to apply to both urban and rural districts. Dealing with the third mentioned Bill, to enable rural district councils to adopt Part I. of the Act without first obtaining the leave of the county council, the speaker said he was strongly of opinion that local authorities should not be permitted to speculate with the ratepayers' money in carrying out building schemes which would probably result in a loss and a consequent taxation of the ratepayers, some of whom might be erecting cottages to compete with them. There was at the present time plenty of private capital available to erect all the houses required, providing a reasonable return on the capital could be assured. There was no demand or necessity for the Land Tenure Bill, which was likely to interfere with the present pleasant relations between landlord and tenant.

A vote of thanks was accorded Mr. Willmot for his paper. In the short discussion that followed, the Land Tenure Bill was strongly condemned, while one speaker described the legislation as "most mischievous and socialistic."

In Response to the appeal of Mayor Schmitz, of San Francisco, for architects, draughtsmen and superintendents of building construction to assist in rebuilding the city, Hapgoods, the national American organisation of employment experts, has offered its services without charge either to employer or employé, and will work in close co-operation with the city authorities in finding suitable men to go there immediately.

DECADENCE OF ART.

AN address was delivered by the Bishop of Birmingham on "The Decadence of Art." His Lordship insisted that while we had advanced in the gifts of mechanical power, we had distinctly gone back on the artistic side. We gazed on the relics of Greece, in which the human spirit was exquisitely expressed in form and outline. We luxuriated on the great spirit of Mediæval or Renaissance art. We took the great epochs of art in Flanders or Spain, and we examined the extraordinary wealth of artistic skill of certain kinds which must have belonged to Mediæval England. We marvelled both at the glory of those manifold gifts and at the strange way in which they had been withdrawn. There were those who hoped that a revival would take place. They were growing dissatisfied with the hideous mechanism of our decorations and of our ornaments in houses and in churches. They would encourage everything by which men might be trained to make the most of their gifts, but any healthy revival must be in the direction of making beautiful the common things of use in houses and churches. We must begin at the foundation, and make beautiful the common and the serviceable things of life. What great need there was. In the churches much money had been lovingly spent on brasswork, on altar rails, eagle lecterns and screens Frequently they were mechanical, ugly, formless, barren of ideas. They seemed to have been turned out at so much the yard. There was so little of this class of work which they would wish should be retained and handed down to future generations. It would be done only with a sense of shame, because the outlines were so feeble, the conception and the execution so purely mechanical. There was much to be desired, too, from an artistic point of view in the furniture of the house and of the church. The work of recovery must begin from the bottom. It must be in the cultivation of the common sense of form and beauty. There should appear something of the individual soul, of the personality, in such work, even on common objects. In no place more than Birmingham, where so much was made which served the purposes of life, ought encouragement to be given so that things might be made alike serviceable and beautiful.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE final general meeting of the session of the Architectural Association of Ireland was held on the 22nd ult. Mr. H. Allberry, president, occupied the chair. The following officers for the ensuing session were elected:—President, Mr. J. Holloway; vice-president, Mr. E. Broadway; committee, Messrs. J. H. Webb, H. Allberry, H. G. Leask, G. F. Beckett, A. G. C. Millar, M. J. Burke, P. L. Dickinson, J. Geoghegan and G. L. O'Connor; hon. treasurer, F. Hayes; hon. secs., L. O'Callaghan and C. H. Mitchell; hon. librarian and registrar, G. C. Lynes; hon. auditors, G. L. Harrison and J. W. Beckett.

On the walls of the lecture hall drawings which had been executed in competition for prizes were exhibited. The President said it was a satisfactory feature of the work of that Association to see their younger members qualifying themselves in a marked degree for the profession which they had adopted.

The President then distributed the prizes as follows:—10*l.* A. A. I. Travelling Studentship, C. G. Ramsay; Institute Prize, 10*l.* 10*s.*, A. W. Reid; Lynch Prize, 5*l.* 5*s.*, H. G. Leask; Downes Bronze Medal, G. F. Beckett. History Class—1st, 2*l.*, T. F. Strahan. Building Construction—1st, 2*l.*, P. J. Munden; 2nd, 1*l.*, J. W. Beckett. Class of Design—1st, 2*l.*, C. Keefe; 2nd, 1*l.*, P. J. Munden.

The Secretary announced that the committee had fixed on Northamptonshire for their next annual excursion.

On the motion of Mr. W. Stainer, seconded by Mr. C. H. Mitchell, a vote of thanks was passed to the scrutineers and to the secretaries.

The President, on vacating his office, said that the session on the whole had been an average one. The committee had grappled with the details of classes for education and for the formation of a museum. The latter had been placed on a workable basis, and provided it received the support of manufacturers and others, it would prove of incalculable benefit to them all. They owed a debt of gratitude to Mr. Hayes, the hon. secretary of the committee, for all the work he had done in connection with this matter.

On the motion of Mr. C. H. Ashworth, a vote of thanks was passed to Mr. Allberry, and the proceedings terminated.

NOTES AND COMMENTS.

THERE is a curious dispute in progress at Berlin with regard to the Virchow Memorial. VIRCHOW was one of the great reformers of medicine as a science. Believing that prevention was better than cure he became a champion of sanitary reform. There were other men who took up the cause at an earlier time, but none of them had a similar reputation for scientific knowledge. After his death it was decided as a matter of course that he should have his memorial in Berlin—the city where he not only experimented and investigated, but of which he was one of the Parliamentary representatives. A competition was accordingly arranged among sculptors and a jury was appointed. Medical men were, of course, influential not only as members of the jury but as promoters of the memorial. Indeed, some believed that it was their ideas which the successful competitor, Herr KLEINSCH, was ambitious to express. He contented himself with having a medallion portrait of VIRCHOW, with several allegorical figures which were suggestive of the good fight which the pathologist made against foes of public health. The men who have an interest in VIRCHOW from belonging to his profession, and who profess to follow in his footsteps, are eager to have a large statue of him, all the other details being subservient to it. A man who undertakes such a task as VIRCHOW's has to become a solitary, and it is hardly correct to suggest for the benefit of posterity that he adopted a soldier's tactics. He gained by intellectual rather than by physical force. The dispute is causing much interest in Germany, because it affords an opportunity to bring forward rival systems of æsthetics. Meantime the progress of the memorial is delayed.

IT has often been remarked that in this country painters who find no demand for their works in oils or in water-colours have a scorn for lithography which, in France and England, allows artists profitable employment in the intervals between work of a more ambitious kind. It is a satire on the principles instilled into students in art schools when we find that the education committee of the London County Council are obliged to turn to German artists for examples which can be hung in the metropolitan schools. They are able to obtain pictures which they describe as "the outcome of an art movement in Germany, which has for its objects the closer and less artificial connection with nature and the improvement of the technique of the reproduction of colour; they contain the work of living German artists, and are reproduced by a special artistic lithographic process. The originals have been specially painted with a view to their reproduction in colours, hence their comparative simplicity in conception and design, and broad, powerful colouring effects. Each sheet is an auto-lithograph, and every stone requisite to its production is prepared by the artist himself." What is likewise remarkable is that the German coloured plates are not only less conventional than black and white plates obtained from English publishers, but they are much cheaper. In order to make the plates better known it is proposed to hold an exhibition in the Central School of Arts and Crafts next month.

IT is common to expect much difference in valuations by experts of buildings and other property when they give evidence before an arbitrator. But a somewhat unusual kind of subject is a ferry, especially when it is connected with a small town. A case of the kind has just come before Mr. DANIEL WATNEY. The Urban Council of Littlehampton last year obtained an Act to enable them to construct a bridge across the Arun, from plans by Major TULLOCH. A chain ferry existed since 1824, and it was found to be sufficient to serve the rather irregular traffic. It was necessary to purchase the ferry rights. In 1899 the tolls were rented at 250*l.* per annum. But now the rent has increased to 862*l.* Out of that sum have to be paid wages, repairs, rates and taxes, which now amount to 481*l.* per annum. When it was necessary to have an estimate of the cost of the undertaking, the solicitor to the Ferry Trustees stated that the Urban Council would have to pay 4,000*l.* That amount was based on insufficient data. At the inquiry Mr. W. H. ELWILL, for the trustees, estimated the value of the ferry at 21,870*l.*, Mr. R. S. ELLIS at 22,864*l.* On behalf of the Council Mr. S. WALKER considered the value to be only 3,703*l.*, while Mr. A. L. RYDE gave it as 3,465*l.* After consideration, Mr. WATNEY declared on Tuesday that the sum to be paid to the trustees will be 8,415*l.* As an examination of the account books showed that during seven years the average receipts amounted to 665*l.* a year, while the corresponding expenditure was about 530*l.*, and the average dividend was 5¼ per cent., or 158*l.* on a capital of 3,000*l.*, it will be evident that the trustees have reason to congratulate themselves on the result.

ILLUSTRATIONS.

THE ROYAL WATERLOO HOSPITAL FOR CHILDREN AND WOMEN, WATERLOO BRIDGE ROAD, S.E.

THE new Hospital for Children and Women contains on the ground-floor the administrative offices, with accommodation for secretary, committee, matron, resident medical staff, waiting-rooms, hall and entrance-porch, situate at the corner of Waterloo Bridge Road and Stamford Street. The first, second and third floors are devoted to the wards, each ward having an open balcony. The bath-rooms and sanitary offices are separated by a ventilated corridor on each floor. Provision is made for a day-room on the first floor, an isolated ward on the second floor, and operating theatre on the third floor. The floors are of fire-resisting construction throughout. The total cost of the buildings was about 50,000*l.* The front is of red brick and terra-cotta. The corner entrance-porch is of glazed ware by Messrs. DOULTON & Co., who defrayed the cost thereof as a gift to the hospital. The contractors were Messrs. HOLLIDAY & GREENWOOD, LTD., and the architects Messrs. WARING & NICHOLSON.

COMPETITION DESIGN FOR COUNCIL HOUSE EXTENSION BIRMINGHAM.

THIS design shows a scheme planned on axial lines, and with the irregularity in Edmund Street squared up. The galleries have been arranged for convenient circulation, long vistas, and the large gallery next Edmund Street has a simple architectural treatment which is not out of place in a scheme of this extent. The galleries are approached from the old museum by means of a bridge across Edmund Street in one span. The future extension between the loan gallery and Great Charles Street has been designed for the extension of picture galleries on the first floor and sculpture galleries, together with a grand entrance and staircase in the centre of the Great Charles Street façade. The office blocks in Margaret Street and Congreve Street can be readily followed from the plan, which shows a staircase and lifts arranged on the axis projecting into the area and a continuous suite of various departments to the fronts. The angles of the block are rounded between two pavilions to help the electric trams which circulate round the building. The gas department is placed in the centre of Edmund Street front under the galleries, with domed skylights. The tramway department has a separate entrance from Great Charles Street, where an entrance for vans is provided to each area. The elevations have been designed to harmonise with the old buildings, with the enrichment concentrated in the pavilions. Messrs. NICOL & NICOL are the architects.

THE GENERAL SUPPLY OF ELECTRICITY.*

AT the present time, when so much has been done in Europe and in America to provide a general supply of electricity, and almost the whole of England has been parcelled out among a number of electric-power companies, there needs some explanation as to the selection of the title for this paper, and likewise as to the nature and scope thereof.

It is not intended in the following remarks to include anything of a technical character, since the many fine examples of electricity distributing stations which exist in this and in other countries clearly show that it is unnecessary to do so. But it does not require any intimate acquaintance with the conditions which prevail in this and in other countries respecting the supply of electricity for industrial purposes to arrive at the conclusion that in England the facilities generally available are much less than in other important countries. And this country is thereby placed at a considerable disadvantage in its commercial competition with European, American and other markets. The object, therefore, of the following remarks is to endeavour to ascertain the cause of the backwardness in this country, while at the same time suggestions will be put forward and discussion invited thereon, in the hope of finding a remedy whereby the want of enterprise which prevails in this country as to the extension of these general supplies of electricity may be further stimulated; and at the same time an increased confidence therein may be imparted both to manufacturers and to the general public to avail themselves of the advantages thus offered to them.

During the last few years the value, nay, almost the need, of electrical energy in carrying out a large number of operations which are of almost primary importance to the welfare and interests of the community at large has become gradually more and more recognised.

These interests may be described (1) of a public character, and involving not merely the sanitary and other similar objects which are embraced under the phrase "electric lighting," but also in the further facilities afforded under the head of "traction," to enable the public to carry out more expeditiously their ordinary avocations; (2) of a private character, in providing the commercial and the trading portion of the community with improved methods of carrying out their various kinds of manufactures, in the transport of their materials, and in the disposal of their manufactured goods; and (3) of an almost national character, in providing more favourable conditions for British commercial interests in the keen competition which is arising against us in our own as well as in foreign markets.

It is admitted that a general supply of electrical energy, laid down under favourable commercial conditions, and capable of complying with the requirements of all of the above-mentioned interests, is becoming a matter of much moment to the community at large, far exceeding the limits of the private interests of certain trading and commercial circles.

To insure, however, the production and supply of electrical energy under the most favourable conditions, especially as to financial economy, the clashing of conflicting interests must be avoided as far as is possible.

It is with this object that efforts have been made during the last few years by the Board of Trade, by some of the county councils and also by some of the more important users of electrical energy to endeavour to obtain uniformity, especially on two points, viz. (*a*) similarity in the nature of the electrical supply; (*b*) uniformity in the gauge of the roadways used in transportation.

Some progress has taken place of late on both of these points, and also important attempts are being made to obtain continuity in transportation. For instance, a commencement was made some time back by the Liverpool Corporation and by the South Lancashire tramways to convey both passengers and goods over their joint systems, wherein they had the co operation of the Mersey Docks and Harbour Board and of the Great Central Railway.

One of the most serious drawbacks, however, to a satisfactory solution of the many difficulties which prevent the question of the supply of electrical energy being dealt with in a broad and comprehensive spirit, such as is suggested above, is the attitude in which the entire matter has been approached by the Legislature during the past few years—that of treating it as if it was simply a private trading question, and entirely overlooking the numerous and varied interests of the public community.

To illustrate the difference between the private trading concern and that of the public character of the position which is looming in the near future—if, indeed, it is not already within a very measurable distance—we may take as an example the belt of country comprised within South Lancashire and the West Riding of Yorkshire, a district extending from sea to sea, teeming with an industrial population and embracing some of the most important trades and commercial enterprises in the British Isles. The district probably contains within it about one-quarter of the population, as also of the commercial energy of the whole of England. Over this large tract of land, embracing about 4,000 square miles, the Legislature has granted rights to two private companies for the production and supply of electrical energy, and those rights, covering about 4,000 square miles, are practically exclusive ones amounting almost to monopolies granted in 1900 by the Lancashire Electrical Power Act, and in 1901 by the Yorkshire Electrical Power Act, a number of private traders, yet with the result in 1906 that so far practically little or nothing has been done to carry out those powers.

Nor can it be said that this result is due to any enormous amount of capital required, or to the magnitude of the works which are necessitated.

The result would rather appear to be due to the multiplicity and importance of the large and varied interests throughout this vast district, which are now forcing themselves prominently forward; showing that these interests are too important to be dealt with satisfactorily for the public weal by private traders, no matter how distinguished the individuals may be.

It would seem, therefore, as if the community of interests, so large and important in themselves—of both a public and a private character—as to be almost national in their scope, could only be dealt with by a public board, which would represent most, if not all, of the numerous and varied interests which centre in the large and important portion of England now being referred to in Lancashire and in Yorkshire. And this likewise would apply to other similarly situated areas allotted to electric-power schemes.

Fortunately examples exist of such public boards, as, for instance, the Mersey Docks and Harbour Board, the pioneer, with its half-century of experience, and others of a similar character. There are boards connected with the Clyde and the Tyne; there are also the Thames Conservancy Board, the Metropolis Water Board, as well as others, representing inland rivers, and also water authorities.

Nor need the fact stand in the way that Parliamentary powers already exist and protect certain private and vested interests. For did not the same difficulty arise, only with perhaps greater force, against the formation of the Mersey Docks and Harbour Board; in the vested interests of the Liverpool Corporation in their long-established docks, as also of the more recently appointed trustees of the Birkenhead Docks? Yet these difficulties, and others subsequent to them, have all been successfully overcome, and in a spirit of fairness to all interests, wherever it has been shown that the public weal demanded it.

The advantage of a board of such a representative character, containing both manufacturers and users of the electric energy, as well as others commercially interested in the welfare and extended development of that supply, would be that it would engender and foster a friendly spirit for its success throughout the entire district, and would thus become essentially a "home-supply," replacing thereby the spirit of continuous and ever-increasing rivalry with which a private company trading for its own advantage and not for that of the district itself would meet with on all sides.

A further advantage which would follow from this board, combining general and local interests, working for the benefit of the district itself, would be the exclusion of outside and, still more, of foreign interests, which last already have done much in this country, it is said, to hamper and even to mar the progress of electric-power schemes.

All recent Parliamentary legislation connected with electric-power Acts has been based upon the report (in 1898) of the joint select committee of the House of Lords and the House of Commons, known as Lord Cross's committee, he having been chairman thereof. This committee was specially appointed for the purpose of considering the subject of "electrical energy, generating stations and supply." In their report the committee recommend practically that the

* A paper by James N. Shoolbred, B.A., M.Inst.C.E., read at a meeting of the Society of Arts on May 23.

Digitized by Google

lines upon which, with certain modifications, the Electric Lighting and Power Acts which had been passed between 1863 and 1898 should be continued. These were to grant compulsory powers, either to local authorities or to incorporated companies, for the carrying out of the electrical supply under conditions settled by the Board of Trade, and these powers practically gave the undertakers a monopoly of the electric supply in the district allotted to them.

Subsequent experience has shown, however, that the conditions under which the earlier Electric Lighting and Power Acts, each with its moderate area of a few square miles, and having but one common centre for the various interests, both public and private, are altogether different from those which occur in the electric-power schemes, such as contemplated by this committee, with their areas of 1,000 square miles, and in a few cases up to 2,000 square miles. For, in the latter case, the large area invariably contains within it a number of the local centres of the earlier Acts, often conflicting one with another, and therefore very difficult to weld into one homogeneous whole, and under one single managing body. But when, besides this diversity of "public" interests in various parts of the district, there are added the numerous and often very conflicting claims of the manufacturing, the trade-carrying and other so-called "private" interests, the difficulties are still further increased, and the more so because all these "private" interests are inclined to resist being placed in the hands of a virtual "monopoly" by a particular class. These difficulties, it is safe to say, did not present themselves to the select committee of 1898, nor were they considered in their "report." Nevertheless such difficulties are arising every day, and to insure success for the electric power supply they must be met as far as possible.

Then again, as to the Stock Exchange and the absence of financial success which has followed some of the appeals made by the promoters of electric-power schemes. With a concern beset with conflicting difficulties such as have just been stated, and in itself, in some cases, almost "a tied concern," and also largely without the confidence of the class whom it would desire to secure as its customers, is it surprising that the financial appeal should not be a success? But what is the requisite, it may be asked, that is necessary to secure this confidence in the electric-power supply? "Community of interests with the promoters in the welfare of the concern, and a proportionate share with them in the management of the electric supply, and for the benefit of all interests in any way connected with it." This is the reply of some who have followed these matters closely, whose opinion, from their acquaintance with the different bearings of the question, is entitled to consideration.

It is true that an attempt by some of the electric-power companies has been made to offer to share with their customers the profits above a certain figure. But this does not suffice to arrive at anything like complete success. To do this there needs a proportionate representation on the managing body of all interests concerned in the development of the electric supply. But this means a public body specially selected in its members and adapted to the varying conditions of the locality under consideration, and the larger the area of the district the greater the difficulty in reconciling and in duly representing the various interests contained within it. But the task of doing so successfully, within the limits of a public board, is not impossible, since many examples thereof exist in various parts of the country. Probably one of the best-known examples of a public board having within it a number of interests to be dealt with, and successful in dealing with them, is that of the Mersey Docks and Harbour Board at Liverpool, which has an existence of half a century. The Board was formed in 1857, and it took over the control and management of the docks at Liverpool and at Birkenhead. It consists of twenty-eight members, of whom twenty-four are elected by the dock ratepayers and four are appointed by the Conservancy Commissioners of the river Mersey, viz. the First Lord of the Admiralty, the President of the Board of Trade and the Chancellor of the Duchy of Lancaster.

A person to be qualified to be an elective member of the Board must reside within the Customs port of Livepool, or within ten miles of the outward boundary of that port. The members are elected for four years, and eligible for re-election. They receive no remuneration for their services.

The qualification of an elector is the payment to the Board of rates, due from him in respect of ships or goods, to an amount of not less than 10*l.* in the year preceding the 1st of August. He must be a British subject, or if a foreigner be resident in the United Kingdom, and his name must be on the list of dock electors; this in 1905 contained 3,500 names.

The above are the official regulations relating to the constitution of the Board set out by Act of Parliament. In order, however, to insure the fair and proportionate representation of the various interests on the Board, such as of steamers and sailing vessels, of corn, cotton, general produce, &c., an arrangement or understanding has come into operation under which, by tacit consent among the twenty-four elected members, persons are elected representatives of certain trades carried on in the port. This arrangement has, however, no binding effect, and occasionally persons are nominated for election independently of this arrangement. To this tacit understanding, however, is attributed much of the fairness and the smooth working of the Mersey Docks and Harbour Board. The various interests, based upon the amount of dock dues, &c., paid by each trade, are generally supposed to be divided among the 24 elective members of the Board in the following proportions:—Steamers and sailing vessels, 12 members; general produce, 4; corn, 2; cotton, 2; provisions, 1; fruit, 1; and independent, 2. The total income of the Board in 1905 amounted to somewhat over 1,250,000*l.* sterling, of which the steamers and sailing vessels contributed 700,000*l.*

The Clyde Conservancy, 1871, consists of twenty trustees, eleven being elective (six by the ratepayers of Glasgow, three by those of Greenock, and two by those of Port Glasgow). Five appointed ones—two by the Chamber of Commerce of Glasgow, two by the Chamber of Commerce of Greenock and one by the Merchants' House of Glasgow. Three are *ex officio*, viz. the Chairman of Trustees of the Clyde Navigation, of the Port and Harbour of Greenock, and that of Port Glasgow, respectively; and Sir Michael Shaw Stewart, Bart., and his heirs male, in the estate of Greenock. They are termed the Trustees of the Clyde Lighthouses. The qualification for an elector of, as well as for an "elective trustee," is that during the year previous to August 31 he shall have paid 2*l.* or upwards of rates under this Act; and also be resident within three miles of the city of Glasgow, the town of Greenock, or the town of Port Glasgow.

The Tyne Improvement Commission, dating back to 1850, is another example. It really means the "Port of Newcastle," extending from the sea to a point called "Hedwin Streams," a certain distance above Newcastle. The Tyne Improvement Commissioners are eighteen in number, four being nominated in the Act, six by the Council of Newcastle, two by that of Gateshead, three by that of Tynemouth and three by that of South Shields. The voter for the Commissioners to be, either (1) a shipowner of a vessel of at least 100 tons, and which has paid tonnage dues during the preceding year, entitling him to one vote for the first 100 tons, and to one vote for each additional 250 tons, up to a maximum of eighteen votes, or (2) a coal-owner, shipping coal during the past year, is entitled to one vote for the first 10,000 tons and to one vote for each additional 25,000 tons up to a maximum of eighteen votes, or (3) a trader paying dues, toll, &c. (other than on coal and coke) during the preceding year, is entitled to one vote for the first 10*l.* paid, and to one additional vote for each 25*l.* paid, up to a maximum of eighteen votes.

The Thames Conservancy Board, as reconstituted by the Act of 1894, consists of thirty-eight conservators, of whom the Admiralty nominates two, the Board of Trade two, the Trinity House two, the London County Council six, the Corporation of London six, the County Councils of Berks, Bucks, Essex, Herts, Kent, Gloucester and Wilts (together), Middlesex, Oxford and Surrey one each; also the Councils of Oxford, Reading, West Ham and the Metropolitan Water Board one each; likewise the shipowners elect three, the owners of sailing barges and steam tugs two, the dock-owners one and the wharfingers one.

The Metropolis Water Board, 1902, consists of a chairman, a vice-chairman and of the following nominated members:—Fourteen by the London County Council, two by the Corporation of London, two by the City of Westminster, one by each of the Metropolitan Borough Councils, one by each of the County Councils of Essex, Herts, Kent, Middlesex and Surrey, one each by the Thames Conservancy and by the Lee Conservancy, one each by the Urban councils of West Ham, East Ham, Leyton and Walthamstow, and one each from eight groups of urban and rural district councils situate Essex, Kent, Middlesex and Surrey respectively.

The Derwent Valley Water Board (1899) is an interest-

Digitized by Google

ing example, as its constitution was the result of a long discussion in Parliament. Originally four distinct Bills were deposited by the Corporations of Derby, Leicester, Nottingham and Sheffield, each to obtain independent water rights over this Derbyshire river. But by the insistence of the House of Commons committee, under the chairmanship of Sir John Brunner, Bart., the claims of all of these Corporations were combined under one Board of thirteen members, constituted in the following proportions:—Derby Council three, Leicester four, Nottingham two, Sheffield three, and the Derby County Council one member.

In the above-quoted examples there may be found a large number of interests, differing widely in their character. It is interesting, therefore, to note the various ways in which they have been treated, so as to insure a commercial amount of satisfaction. It is to be hoped that these and other examples, which may perhaps be instanced in the discussion on the subject of the paper, may prove of value as suggesting a mode of reconciling the various and often conflicting interests which are found to occur, and which have to be dealt with in connection with the electric supply of the power Acts. The main object, of course, is to endeavour to secure a mutual confidence between the "suppliers" and all classes of the "supplied," so that all may feel that each interest is being treated with consideration, and in such a spirit of fairness that their united co-operation is enlisted in the development of the electric supply, so as to aid and insure to it the largest amount of success. And also that while doing this they may, each and all, endeavour to render the terms of the supply such as may be of national assistance in the competition with foreign countries.

INDIAN ARCHÆOLOGY.

THE Indian Government have obtained Mr. Morley's sanction to a scheme submitted in November last for the organisation of the Archæological Department on a permanent and improved footing. It is shown that although much has been done since a Director-General of Archæology was appointed in 1902 for a period of five years, the experience gained has proved that the task of restoring and conserving the antiquities of India will always require trained ability for its adequate discharge, while the vast area of the field and the great number and variety of the monuments to be dealt with render it improbable that any substantial reduction in the present staff will be feasible for many years to come. The present Director-General of Archæology is confirmed in his appointment. In lieu of the present Government epigraphist for Madras, the scheme provides for the appointment of a Government epigraphist for the whole of India, whose duty it will be to organise and collate the results of the epigraphical work of the provincial surveys. At the same time, the importance of Madras for this form of research and its special linguistic conditions necessitate the retention of a special epigraphical expert in that presidency. The number of archæological circles remains the same, but their names have been changed to render them more descriptive and appropriate. There is a new appointment of superintendent for the North-West Frontier Province and Baluchistan, where the work has hitherto been done by the Education Department. It is estimated that the work of restoring monuments of first-rate historical or architectural importance will be completed within the next fifteen or twenty years.

EVOLUTION OF LONDON COUNTY SCHOOLS.*

WHEN the London School Board began its building work, and before it appointed an architect of its own for the purpose, in consequence of the urgent need of more rapid provision of school accommodation, the planning and erection of the first thirty schools were entrusted to various architects. These schools, although handsome in elevation and in some cases built by architects of considerable reputation, were yet ill-adapted for teaching, partly because of the absence of general professional knowledge of the requirements of a good school, and partly because of the very meagre code of the then Education Department, the building rules being of a most elementary description, and such rules and illustrations as existed tending rather to perpetuate defects than to stimulate improvement. The staircases were long, steep and narrow. Cloak-rooms were either insufficient or altogether wanting, Teachers' rooms were practically unknown as contrasted with the present provision of both head teachers' and assistant teachers' rooms. The classrooms were subsequently found to be of unsuitable sizes, and the scholars sat for the most part with their backs to the windows. Most of the rooms were passage rooms one to another, and, in addition, the sites were small and playgrounds were very insufficient. In respect of these earlier schools the Education Department allowed a building loan of 10*l.* per child accommodated.

Of necessity, therefore, a great many of these earlier schools have since had to be improved, halls added, new staircases of a modern type built, and the schools properly equipped with cloak-rooms, lavatories, teachers' rooms, &c.

After the Board appointed its own architect, the earlier schools built by him showed no marked departure in planning from the previous types, but gradually a certain improvement was effected. The dominant idea, however, was still that of a schoolroom holding several classes, supplemented by a moderate number of classrooms. Corridors for reaching the end rooms were introduced, but these were also made to serve the purpose of cloak-rooms; they were far too narrow to insure safety in the event of fire or panic, and the hanging of cloaks in them was inconvenient and dangerous.

In 1883 the School Board began to recognise more especially the importance of left lighting, and with this object in view planned square classrooms for sixty children, with five rows of dual desks, arranged six deep, as compared with the former size, viz. 29 feet 4 inches by 22 feet. This arrangement was objected to by the Education Department on the ground that desks should not be more than five deep, but the Board adhered to their plans, which were tacitly accepted. From this time the improvement in school planning has been continuous.

About the year 1888 the late authority in view of the large and increasing amount expended yearly on maintenance account in pointing the exterior walls, &c., and in painting the internal walls, decided that the brickwork should be built in cement in lieu of lime mortar, and that the internal walls of staircases and corridors and dadoes of classrooms and halls should be faced with glazed bricks. In consideration of the increasing use made of the halls for drill and public meetings, a much heavier and more rigid type of floor construction than had hitherto obtained was adopted.

It was not until the year 1891 that the Education Department so far acknowledged the utility of a hall in a school as to grant a special loan for the purpose for every school. Previously the cost of the hall, when provided, had to be included within the before-mentioned loan limit of 10*l.* per child accommodated, unless an allowance was specially made. Consequently the cost was nearly always prohibitive, unless the hall was reckoned in the accommodation, or was of such restricted dimensions as to be more of a corridor than a hall. Since the Department allowed a loan of 1*l.* per foot floor space for the halls, the Board were able to provide them in every new school.

In 1891 the Board, which had for several years neglected the provision of drawing classrooms, determined to provide them, and many spacious and convenient rooms have been built over the halls for this purpose.

Another item in the cost of schools is the amount of decorative detail put into them. The policy of the late authority was almost always to give these structures, as public buildings, some dignity of appearance, and to make them ornaments rather than disfigurements to the neighbourhoods in which they were erected. Where in a few cases, striving after the sternest economy has led to very plain buildings being erected, as in the case of Trundley's Road (Deptford), Enfield Road (Hackney, Central), Ellerslie Road (Hammersmith), and one or two others, the resentment of those who contrasted the appearance of these with other schools in the neighbourhood led to a reversion to the more ornamental type.

It was found that the difference between the cost of buildings erected on utilitarian lines and those designed with some regard to materials, colour and style was about 5 per cent. At the same time this ornamental appearance has been secured either by richness of detail or by a dignified grouping of masses—in some few instances a greater amount of decorative work has been introduced into the buildings than has been permitted to continue after fuller experience of the cost involved.

In recent years, too, the cost of the offices and drainage

* From the Report of the Education Committee.

Digitized by Google

generally has considerably increased under the stringent requirements of sanitary authorities. Where the ground is of a treacherous nature, it is customary to use iron soil drains; glazed tile divisions are provided between each water-closet in the ranges in lieu of woodwork, which is always subject to damage and requires periodical painting, &c. Further, single pans with separate water-waste preventers are provided in lieu of the trough and automatic flusher. The extra cost of these items on a school for 800 children of the ordinary type of building and site may be taken approximately as follows:—

	£
(i.) Building in cement	350
(ii.) Glazed brick facings to staircases and corridors and dadoes of classrooms and halls	950
(iii.) Additional cost of solid floors of classrooms and additional strength and rigidity of hall floors	545
(iv.) Additional cost of iron soil drains, single pans and W.W.P., glazed divisions, &c.	750

representing about 3*l.* 5*s.* per place on these items alone.

It sometimes happens that in consequence of the restricted area of the site a playground has been arranged on the top of the school. This topmost floor comprises playground and science and art-rooms (to which latter exception has recently been taken in some cases by the Board of Education) and increases the cost of the building by about 3,400*l.*, equal to 4*l.* per place. Were the playground not so provided a larger area of land would be required on the level which would probably cost considerably more.

On several occasions the question of the cost of erecting schools was carefully considered by the late authority, the more important investigations being conducted in 1887-9, 1892, 1896, and the last in 1903. In 1887 a special committee was appointed to investigate and report upon the whole of the existing arrangements relating to the work of the works department of the late authority, and as a result of their report the late authority on February 14, 1889 (i.) adopted a new specification—the joint production of Mr. Ewan Christian and Mr. Thomas M. Rickman, the professional advisers called in for the purpose; (ii.) arranged for a more extended supervision over the construction of buildings; (iii.) introduced a more elaborate and expensive system of heating apparatus; (iv.) arranged for the brickwork to be built entirely in cement in lieu of mortar, and (v.) adopted glazed bricks to a very much larger extent than had formerly been the case.

In 1892 the late authority desired to ascertain whether it would be possible to obtain from outside architects any fresh ideas in the planning of its schools, and invited architects to enter into public competition, in accordance with the rules of the Royal Institute of British Architects, for the planning of a school for 1,200 children, capable of being erected on any ordinary site purchased by the Board, the President of the Institute being appointed assessor, and to draw up the terms and conditions of the competition. It was further decided that three premiums of 150*l.*, 100*l.* and 50*l.* respectively should be awarded, in the discretion of the assessor, to the architects whose plans were most successful.

The site finally selected was a vacant piece of ground in Fulham Palace Road, and the competition, besides being advertised in the daily and trade journals, was specially brought to the personal notice of a large number of architects. One hundred and twelve architects applied for the instructions, and sixty-one of them sent in designs which were afterwards publicly exhibited in the upper hall of the Hugh Myddelton school, Clerkenwell. The result of the competition was that the assessor, Mr. Macvicar Anderson, reported that it had not produced a novel treatment in respect of plan that had been deemed worthy of approval, and on April 26, 1894, a report was submitted stating that, as a result of the competition, it was gratifying to find that the schools had not only been erected upon what might be fairly considered the most approved plans, but that the cost appeared to be as moderate as seemed possible, judging from the estimates forwarded by the various competitors of the probable cost of the schools if erected according to the designs submitted by them.

In 1896 the subject was again the matter of careful investigation, and the late authority then decided, as an experiment in the case of the next six schools to be erected, to revert the old specification in force in 1885-6, subject to the specification being modified to meet the then requirements of the Board and the Education Department, it being arranged that in the building contracts the quantities should not form part of the contract.

Every detail of the specification was then examined, and after being tabulated, decisions were arrived at which became instructions for the description of the building of the schools.

The schools subsequently selected to be built under these special conditions were the following, the accommodation, cost, &c., being as stated in the subjoined table:—

County Electoral Area and Name of School.	Accommodation.	Date of Acceptance of Tender by late Authority.	Actual Cost.	Area of Site. * This school was subsequently transferred to the Penge education authority.

The last occasion on which this question was considered was in 1903, as a result of observations made by the chairman of the Croydon School Board at the public opening of the Portland Road school having accommodation for 1,310 children, to the effect that the cost of building (exclusive of site and furniture) had been 13*l.* 11*s.* 8*d.* a place, as against a cost of 28*l.* 10*s.* and 30*l.* 15*s.* 4*d.* in two London schools.

In order that a comparison might be made between two schools where the conditions of planning, &c., were as nearly as possible identical, the Invicta Road school, Westcombe Park (Greenwich), was taken as corresponding fairly in general arrangement and size with the Portland Road school, Croydon. The Invicta Road school, which was built in 1898, has 965 places and cost 20*l.* 7*s.* 4*d.* a place. The graded portion of both schools consists of a two-storey building, the infants being accommodated in a separate one-storey building. A comparison was made, item by item, of the various branches of the work done at these schools, and a very full examination was made of materials, quantities and prices. The sub-committee which then reported arrived at the conclusion that the facts before them showed "that having regard to the accommodation provided and the character of that accommodation, and the conditions under which the London School Board are required to work, the London Board have had their work done quite as cheaply at Invicta Road as the Croydon Board at their Portland Road school." It was ascertained that the cost of the school buildings complete, excluding offices, works on site, furniture, &c., amounted to 14,806*l.* for the Invicta Road school and 14,491*l.* for the Croydon school.

In the course of the inquiry it was ascertained that it was cheaper to build a school in two separate blocks, consisting of a two-floor building for the graded school and a one-floor building for the infants' department, than in a single block of three or four floors, and in planning new L.C.C. elementary schools this practice is adopted wherever the site is of sufficient size for the purpose. This was accounted for by the fact that, although in the case of a three-storey building there is a saving in having to provide only one roof, this saving is more than counterbalanced by the additional cost of the greater thickness of brickwork

Digitized by Google

required for the walls, the extra cost of the scaffolding to the upper floors, and the cost of hoisting joists and girders to a great height, &c. This fact compelled the Board to scrutinise carefully its system of planning, which, owing to most of the schools being built in the heart of London, has been predominantly one involving three-storey structures. It should be stated that it was the practice of the late authority when securing vacant sites in outlying districts to acquire sites having an area of about two acres. The following shows the relative cost of erecting (i.) a three-storey building compared with (ii.) three one-storey buildings (boys, girls and infants) and (iii.) two-storey buildings (boys and girls) and a one-storey building for infants :—

(i.) Three-storey building of ordinary type, Broadwater Road, Wandsworth (accommodation 920). Total estimated cost including works to site, offices, &c., but excluding furniture, &c., 20,948*l.*, equivalent to 22*l.* 15*s.* 4*d.* a place.

(ii.) Three one-storey buildings, Deansfield Road, Woolwich (accommodation 1,202). Total estimated cost including works to site, offices, &c., but excluding furniture, &c., 21,953*l.*, equivalent to 18*l.* 5*s.* 3*d.* a place.

(iii.) Two-storey building and a one-storey building, the Waudle, Wandsworth (accommodation 1,140). Total estimated cost including works to site, offices, &c., but excluding furniture, &c., 23,337*l.*, equivalent to 20*l.* 9*s.* 5*d.* a place.

We now pass to the result of our investigations into the cost of erecting schools in London, as compared with the cost of schools recently built under the jurisdiction of education authorities whose areas are contiguous to London. In this connection we have consulted the County Councils of Surrey, Middlesex and Kent, the boroughs of Hornsey, Wimbledon and East Ham, the county boroughs of Croydon and West Ham, and the Urban District Councils of Willesden and Chiswick. From the information which these authorities were good enough to furnish, we were of opinion that the schools erected under the jurisdiction of the Croydon, Willesden and Hornsey authorities were the most suitable to select for purposes of comparison, and some of our members have visited, in company with several members of the Council interested in the construction of schools, the latest schools built under the direction of these authorities. The subjoined statement shows the accommodation and cost of the schools that were inspected :—

Name of Educational Authority.	Name of School.	Total accommodation.	Date of completion.	Total cost, including furniture, supervision, architect's charges, &c.	Total cost per place.
				£ s. d.	£ s. d.
Croydon .	Ingram Road .	1,166	1904	17,110 0 0	14 13 6
	Portland Road .	1,310	1901	18,439 0 0	14 1 6
Hornsey .	Mattison Road .	900	1903-4	23,009 5 0 (excluding special instruction school)	25 11 3
	Pemberton Road . Higher Elementary school	340	1903-4	16,221 12 10	47 14 2
Willesden	Chamberlayne Wood Road	1,224	1902-3	19,000 0 0 (excluding centres and special buildings)	15 10 6
	Salusbury Road .	1,260	1901-2	19,695 0 0 (excluding centres, &c.).	15 12 8

We found that the Croydon schools afforded all the requisite accommodation and presented many good points in comparison with the Council's schools.

In the Croydon schools the general arrangement of the roofs and gutters was suggestive of a country school rather than a town school, and were correspondingly cheaper; in the staircases and corridors the glazed brickwork was carried only to the height of the dado, while in the Council's schools it is carried the whole height of the wall. The dipped bricks used for the dados in the Croydon schools, though of a specially cheap make, are more expensive than the soft glazed bricks used in the Council's schools, but there was nothing in the Croydon schools corresponding to some of the corridors at Bonneville Road school (Clapham), which are built in white glazed bricks from floor to ceiling. The covered playgrounds were small.

On the whole, we have arrived at the conclusion that we should not like to exchange any of the recently erected London schools for one of the Croydon schools, though something may be learned from Croydon in connection with the cheapening of the design of the roofs and in the more restricted employment of glazed bricks, and we intend to take advantage of the information gained on these points.

As regards the schools in Hornsey, the ordinary graded school at Mattison Road consists of a two-storey building for the senior school and a one-storey building for the infants. The woodwork was prominent and expensive, and a good deal of the cost of the roof of the hall in the senior school lay in detail. The manual training-room was palatial as compared with the rooms which have been specially constructed by the Council or by the late authority.

In the laundry the washing was carried out in fixed wooden tubs with water-supply and waste. The kitchen was well designed, with the scullery forming an open annexe, but there was only one kitchen range and no fireplace similar to that to be found in an artisan cottage. The swimming-bath was about 40 feet long, which was too short for the requirements, inasmuch as it involved a somewhat dangerously steep floor. The gallery was provided with dressing-boxes.

Throughout the ground floor of the building, comprising the swimming-bath and domestic economy centre, there was a profusion of glazed bricks, and the 22-inch walls were unnecessarily heavy.

The housewifery department consisted of a well-furnished sitting-room, bedroom and kitchen with scullery attached.

We are of opinion that the Council would not secure economy by following the example of the Hornsey local authority in any particular, except perhaps that simple tiled roofs with eaves gutters are less expensive than lofty parapets.

The higher elementary school at Pemberton Road, Hornsey, was organised as a secondary school for 340 children under sixteen years of age. The accommodation included a good room for the head master, classrooms, a hall about half the size necessary for a secondary school and incommoded by a row of iron columns, a chemical laboratory for twenty-four, an experimental science laboratory for twenty-four, a balance-room, a preparation-room, a demonstration theatre and a good art-room, with special wall-fittings made to the design of the head master. There was, however, no dining-room, kitchen, common-room, library or gymnasium, so that the building fell considerably short of the accommodation generally provided in a secondary school.

The brickwork was carried out in lime mortar with a profusion of glazed bricks, and in particular two 14-inch longitudinal walls were carried right through the building on both upper floors, one on each side of the corridor, the weight of one of these walls on the first floor necessitating the columns in the hall above referred to.

As regards the two schools we visited at Willesden, the Salusbury Road school comprises an infants' department and a mixed department. The Chamberlayne Wood Road school is organised as infants, girls and boys. The former school has an infants' hall on the ground floor and a hall for the mixed department, extending through two storeys with a gallery. The latter school has a hall for each department. Both schools were planned very much on the lines of the majority of the three-storey buildings recently erected in London, but in neither school was there any provision for science or drawing, the buildings comprising only the halls, classrooms, rooms for the head and assistant teachers and cloak-rooms.

The first point that was noticed was the economy observed in the erection of the playing sheds. These were supported on slender iron columns, the roof being carried by a timber plate and covered with zinc. In the staircases and lobbies there is a glazed brick dado surmounted by plain distempered brickwork. As in the case of some of the London schools, economy was effected by providing no fireplaces except in the babies' rooms.

With the exception of the roof principals of the two-storey hall in Salusbury Road school the joinery was of the simplest possible character.

Except, perhaps, in the arrangement by which a store-room was provided in a mezzanine above the ground floor corridor, and in the cheaper construction of the sheds in the playground, it did not appear that the schools exhibited any points which should be imitated in the Council's schools. Generally speaking they appear to have been carried out on the same lines as the Council's schools with the practice of certain small economies.

The plans and specifications of two schools built under the supervision of the Chiswick and West Ham local authorities were also kindly lent to us, and after a careful perusal of the specifications and a full examination of the drawings as to plan, &c., we have arrived at the conclusion

Digitized by Google

that very little difference, if any, exists—indeed, in one or two cases the specifications involve work of a more costly nature than that adopted in the Council's schools.

(*To be concluded.*)

ARCHITECTURE IN SCOTTISH ART SCHOOLS.

IN his report to the Governors of Robert Gordon's College in Aberdeen on the art school in connection with the institution, Dr. Rowand Anderson adds some general remarks on the subject of architectural education in the art schools in Scotland. "The art schools in Scotland (I refer chiefly to architectural education) will," he says, "never do their work thoroughly unless pupils come to them better educated and prepared than at present. No apprentice should be taken under sixteen years of age, and must possess an intermediate leaving certificate. It should be made a condition in all indentures that the apprentice must attend the art classes from the beginning of his apprenticeship. Representations should be made to architectural societies to adopt resolutions embodying these suggestions, and, from what I learned in Glasgow and Aberdeen, I believe architects would readily fall in with such arrangements. While I advocate the concentration of art teaching in one central art school, the Heriot-Watt College and all other technical schools must still carry on drawing classes, as any engineer or man of science cannot be considered completely educated unless he is a good draughtsman."

TESSERÆ.

Modelling in Clay and Wax.

FOR modelling clay, stucco, plaster and wax were used. Works of great antiquity formed of these substances are still preserved in the different museums of art. Models in clay were usually dried and then baked in an oven, by which they became as hard as stone, and were very durable, as they were unaffected by atmospheric changes. Moulds were then made by a similar process, into which soft clay could be pressed, and objects were thus multiplied with facility. Clay thus treated is called terra-cotta. The ancients must have used it extensively, as may be seen from the countless number of figures and reliefs, lamps, architectural ornaments, vases, domestic utensils, stamps and other objects which exist, and are still constantly being found in this material. Usually such works are of small size, but there are some statues in the museum at Naples which prove it was also used for statues of large dimensions. There are two figures there especially deserving attention, of Jupiter and Juno of full life size; also two others about 4 feet high with masks, representing an actor and an actress, which probably formed the decoration of a theatre. The specimens in England of ancient terra-cottas are for the most part of small size. They are chiefly reliefs. Some of those in the British Museum are, however, extremely interesting, both for subject and execution. As such works were usually, if not always, designed for architectural decoration, it is probable that they were painted. They were first washed with a thin coating of stucco, and the colour was then laid on with a brush, the preservation of the original surface evidently not being considered of importance. This at least appears to have been the process, judging from several remaining specimens. The employment of wax for modelling and casting is very ancient. Roman families of distinction preserved a collection of statues and busts of their ancestors, which, on particular occasions, were carried in procession at certain festivals or ceremonies; these were sometimes dressed in real drapery. Pliny (xxxv. 2) alludes to this employment of figures of wax. Plaster or stucco is found in the ornamental parts of buildings. At Pompeii there were some few years ago two stucco bassi-relievi of considerable size and of good design on the outer walls of a small inner temple in the court of the Temple of Isis. The material was extremely hard and the colour a creamy white. We possess several specimens of the stuccowork of the ancients in the British Museum. They exhibit great delicacy and sharpness of execution. Many are painted, red being the prevailing colour.

Sir T. Lawrence's Heads.

In Lawrence's works we in vain search for breadth and harmony in the flesh. His heads have not the roundness of nature by reason of the harsh tones of his half-tints; the touches of colour are always perceptible and traceable to their beginnings and endings. It must be conceded that he laboured hard to produce a good work, but he was always travelling without keeping his eye on nature; he did not attempt to make his paintings beautiful by copying the effect of nature on his sitter before him; but his constant aim seems to have been the producing of a certain manner and effect, preconceived in his mind. His method of painting was as follows:—Every feature he carefully outlined in chalk, the lines of which he afterwards went over with the local colours; he was accustomed to paint one eye at a time, then the nose, then the mouth; and perhaps by the time he had gone so far the eyes displeased him, then he outpainted them; the same of the mouth, thus continually painting and repainting. Now all this labour is laudable enough were it directed to the proper point—at the same time painting every part as smooth as possible and keeping the half-tints very low. Then came the finishing; he had a very large palette, a huge bundle of brushes, oils, &c., at hand; then taking his brush he would dab on his tints in lumps of such a tone as united not in the least with the smooth polished surface beneath, and this he called giving the work spirit. A touch of decided light he would put on the eye most in shade to bring it out; a dab of decided white served for the collars. Who will say that this is to be found in nature? When all his paintings were properly hung at the Royal Academy, he repeated on varnishing days this operation of giving "spirit" to his works. We may well, indeed, ask, where all this time was his sitter? Was he not then painting his own "fitful fancies," unmindful of nature? Was he not more anxious to paint up to an exhibition key, and to surpass his contemporaries in meretriciousness rather than to the simplicity and soberness of nature? It was not by such tricks that Reynolds painted; there were no public exhibitions when Vandyke produced his "Gevartius," now in the National Gallery. Both the latter artists copied what was before them, and they were never misled.

Monument of a Boy.

Among the tombs in Elford Church, Staffordshire, is that of a child of the Stanley family, who was killed by a blow from a tennis ball. He is holding the ball in his left hand, and his right is pointing to the place where the fatal blow was received—behind his right ear. The legend once there was *Ubi dolor ibi digitus.* The head of the child rests on an oblong cushion, the hair is worked in small short curls, the body is habited in a sleeved tunic reaching to the ankles, and the lower half opened in front, similar to the first and second Edwardian period; beneath is an under garment with close sleeves to the wrist. On the feet are boots buttoned above the instep; the feet rest on a spaniel dog. The remains of colour on the more protected parts were: the cushion red, with some slight indication of gilding; the hair, boots and dog reddish brown; the face and hands flesh colour; the ball blue; the tunic crimson with gilt border and lined with green; the under-sleeves white; the buttons on shoes gilt. The date of this is said to be 1460.

Correspondence

R.I.B.A. Fellowship Elections.

SIR,—Will you kindly allow me to reply through your columns to the numerous inquiries we have received on the question of demanding a poll for the current list of candidates?

We have no desire to recede from the position we have consistently held, and we find that the resentment against these elections exists as strongly as ever, especially just now among the Birmingham men. But in view of the great anxiety expressed in the recent speeches at Conduit Street, and of the appearance in this list of the names of men who will be an acquisition to the Institute, we in Leeds have decided, rather than give the slightest ground for the charge of fractiousness which has been so freely made, not to demand a poll on the present occasion.

We have been actuated throughout solely by a desire to maintain the honour of the Institute, and we drew up a courteous memorial expressing our views which was duly presented to the election procedure committee.

We hoped that in common fairness, and following several recent precedents, this memorial would be placed

Digitized by Google

before members in the Journal as publicly as the statements made by the other side. But as it has not been published, nor even acknowledged, we shall be grateful if you will give it the greater publicity of your columns. I may say it was carefully held back to avoid drawing attention from the Council's proposals on registration.

FREDK. MUSTO,
Secretary of Leeds Associates' Meeting.

Greek Street Chambers: May 29, 1906.

To the Chairman and Members of the R.I.B.A. Committee on Election Procedure.

Gentlemen,—The undersigned Associates, desiring to approach your committee with respect and in due constitutional form, and being denied the opportunity of taking part in its deliberations, venture to place their views before your committee in the present memorial, submitting :—

(*a*) That the reasons which led to the recent demand for a poll and its result have been misunderstood or wrongly stated by members of the committee.

(*b*) That any attempt to revise the procedure of elections generally, which omitted to inquire into the legitimate grounds of complaint, would render the position worse than before.

(*c*) That the decisive nature of the recent voting indicated a strong feeling of dissatisfaction throughout the country, which deserves the fullest recognition and respect of your committee, and should convince them of the necessity for full investigation.

Your memorialists therefore earnestly request the serious attention of your committee to these facts, and to the following observations in relation thereto.

Firstly, as to the reason for the demand for a poll. It is an undoubted fact that as a consequence of the second resolution passed on February 29, 1904, candidates of relatively insignificant professional standing have been nominated by the Council and duly elected to the Fellowship. Protests have been made from time to time, both at meetings of the Institute and in the press, against this interpretation of the resolution, but they have been unavailing, and the recent demands for a poll were avowedly made with the object of calling the attention of the Council in an emphatic and perfectly regular manner to the dissatisfaction which exists throughout a large proportion of the membership. The voting papers were perfectly clear in their wording, following the form prescribed in the regulations, and the significance of the voting is unmistakable. The statement that your memorialists desire to exclude without exception every candidate who shall not have passed the qualifying examination is incorrect and unfounded. But they respectfully submit that exceptions should be made only in the cases of outstanding prominence and recognised professional distinction, and after a searching investigation of which the result should be voted on by a ballot of all members.

In this way the Fellowship of the Institute would become an honourable distinction conferred by the general assent of brother professionals, with full opportunity for the exercise of discrimination.

The committee may confidently rely on the discrimination of members in this matter, as they cordially welcome the candidature of men of distinction. In the case of the recent election of leading architects who had attained eminence in the profession, it was generally felt that the Institute was honouring itself as well as the candidates.

But it cannot be established that the election of large groups of candidates recommended by the Council on the sole grounds of the practice qualification and the short time remaining before the closing of the door is likely to add dignity to the Institute, or to confer any real distinction on the candidates themselves. The nomination of men who have neglected or failed to qualify as Associates, or of those who have practised mainly as engineers and surveyors with very little architectural capacity, has roused the opposition of members who would otherwise have accepted the situation and waited for the new by-law to come into force.

Secondly, as to remedial measures. The prevailing feeling among members in regard to election to the Fellowship is undoubtedly correctly reflected in the first resolution passed on February 29, 1904, and adopted on June 6 as a by-law.

Since the institution of the compulsory examinations the number of men who have thereby qualified as Associates has steadily increased. They have been actuated by a spirit of *esprit de corps*, by a desire for honourable membership of the Institute and by the encouragement of presidents and leaders of the Institute and the provincial societies; they have felt the educational value to themselves, and have not grudged the expenditure of valuable time and the considerable outlay in preparation in fees and in subscriptions. But they have not expected to find that others of no greater experience and training, and even some who have failed where they themselves had succeeded, were being elected over their heads to the rank of the Fellowship. Your memorialists humbly submit that without some reform in this direction no mere alteration in the details of polling is likely to relieve the present tension. If it be urged that the elections which are the subject of this memorial have taken place with due observance of by-laws and regulations and with the tacit consent of your memorialists themselves, it must be pointed out that more than 50 per cent. of the members reside and practice in provincial towns, and have therefore usually no opportunity of taking part in elections and business meetings. On this account we strongly urge that on all occasions when a vote of the membership is taken the procedure should be by ballot. On our side, however, no opposition would be offered to a proposal to reduce the majority of votes necessary to election. If the entrance were in other respects more rigidly safeguarded a bare majority would appear sufficient, as in the case with election by show of hands.

Further, it may be said that the interests of the Associates membership are protected by the presence upon the Council of their four elected representatives. Your memorialists submit that this measure of representation is entirely inadequate, and is further discounted by the fact that, so far as they are aware, no effort has ever been made by an Associate member of the Council to systematically inform himself of the views of the class he is supposed to represent. Under these circumstances the representation becomes merely nominal, without weight in the deliberations of the Council. Your memorialists appeal for more adequate and effective representation, and beg to urge that they should be allowed to nominate their own candidates for the Council, instead of the nomination paper requiring a majority of Fellows in favour of the nominee.

For convenience of reference the points submitted in this memorial may be summarised as follows :—

1. That your committee should give careful consideration to the circumstances which led up to the recent demand for a poll and its results, so that incidental matters may be regarded in their proper light.

2. That the report of your committee should contain an indication of its views as to the respective status of Fellows and Associates, and matters pertaining thereto which have been referred to in this memorial.

3. That by some modification of the special examination, which would attach the same importance to actual architectural work as to abstract knowledge, means should be provided and recognised by which candidates may be elected as Associates who, on account of age and busy practice, are reluctant to sit for the ordinary examination.

4. That the dignity of the Institute would be augmented if the Fellowship were reserved for distinguished men of high personal achievement, and if the present policy were abandoned.

5. That all voting on questions of policy and of membership be by a poll of the whole electorate. An inexpensive method would not be difficult to devise, which would make use of a detachable portion of the Journal insets.

6. That the representation of the Associate membership upon the Council should be increased, and measures taken to make it more truly representative.

In conclusion, your memorialists entirely disclaim the hostility and organised opposition to the Council with which they have been credited; they would, if allowed, have been glad to be represented before your committee, with the hope of getting due consideration given to their views. Your memorialists are actuated solely by a conscientious desire to remedy the grave dissatisfaction which undoubtedly exists, and to promote a much-needed reform in the procedure connected with the Fellowship of the Institute.

The Hawick Archæological Society have resolved to convey their museum, which is at present housed in the Buccleuch Memorial Science and Art Institute, to the Town Council on behalf of the public. The Town Council have agreed to provide suitable accommodation in the mansion-house in Wilton Lodge Public Park, and they will also bear the expense of removal, while the Archæological Society from their funds will give a donation not exceeding 450*l.*

GENERAL.

Mr. R. Lloyd Jones, surveyor to the Barmouth Council, has tendered his resignation on the ground that the Council had refused to pay him out-of-pocket expenses for extra work done with the waterworks. The resignation has been accepted upon a month's notice being given.

Mr. Augustus St. Gaudens will design the statue of Thomas Jefferson to be erected in Washington by authority of Congress. The statue will cost 20,000*l.*

Professor Hubert von Herkomer, C.V.O., R.A., and Mr. Alfred East, A.R.A., have been elected members of the Royal Society of British Artists.

The Historic Puritan Plate which recently belonged to Yarmouth Congregational church, and was announced to be sold at Christie's, has been withdrawn. The sale of this unique seventeenth-century Communion plate to a London dealer has excited much feeling and controversy in Yarmouth and elsewhere.

The Plans have been completed and details arranged for the new National Museum building, which is to be erected in the Mall, Washington, U.S.A. It is to be three storeys high, 570 feet by 320 feet, and is to cost 2,500,000 dols.

M. Tesson, the secretary of the Commission of Old Paris, has ascertained that the statue in the church of St. Julien le Pauvre, Paris, of Montyon, who founded the famous prize for philanthropy, is no more than a portrait of a model, who received 8*l.* for posing.

A Hotel is to be erected in Cape Town by Mr. J. D. Logan at a cost of 120,000*l.* It will be called "The Selborne" and steel framing will be employed in the construction.

The Statue of Alexandre Dumas fils in the Place Malesherbes, Paris, by M. de Saint-Marceaux, will be unveiled on June 12.

Mr. William Atkinson having retired from the firm of Messrs. Welch & Atkinson, surveyors, 10 Lancaster Place, Strand, W.C., the business will be continued at that address under the old name by Mr. George Stephenson, for many years member of the firm.

Mr. Claude Batley, architect, Kettering, has been awarded first place among ninety-nine competitors for designs for the Carnegie library in Old Kent Road, London. The design by Messrs. Grant & Bowden was awarded second place, and that by Messrs. Springall & Taylor third. Mr. A. W. S. Cross acted as the Council's assessor.

The Professorship of Civil Engineering in the Queen's College, Cork, will become vacant on October 6. Particulars may be obtained from the President of the College.

The Pedestal supporting the easternmost statue on the north side of Westminster Abbey fell to the pathway across the Abbey Green on Monday. Nobody, fortunately, was hurt.

The National Gallery in Edinburgh has been enriched by two pictures lately presented to the nation. One of these is a portrait of Lady Shand painted by the late Robert Herdman, R.S.A., in 1867. The other picture, *Mischief*, is an imaginative work by the late G. F. Watts, R.A., which has been presented by his executors under the scheme sanctioned by the Court of Chancery, in accordance with Mr. Watts's wishes verbally expressed. The picture is dated 1878.

The Fifteenth-Century Preaching Cross in the churchyard of Wookey Church, Somerset, has been restored as a votive offering.

The Derbyshire Archæological and Natural History Society opened their annual congress on Friday with an excursion to Repton. The twenty-eighth annual report of the Society refers to the success which attended the intervention of the Society to preserve the picturesque Elizabethan Grammar School at Ashbourne. Winster Market House has been satisfactorily repaired, and is now safely vested in the national trust.

An Inquiry is to be held in connection with the application for a faculty for the building of the nave of the Hexham Abbey Church. No commencement has been made in regard to the removal of the present police stables, although the sum stipulated by the County Council has been paid to that authority. The removal of this block of building is necessary before a beginning can be made with the building of the nave.

Mr. F. Cayley Robinson has been elected member of the Institute of Oil-Painters, Piccadilly.

Dr. Thomas Ashby has been appointed director of the British School in Rome. He has been assistant director, and has superintended various excavations.

A Public Meeting was held in Bedford under the chairmanship of Viscount Peel, when it was unanimously decided to establish a museum for the county. A committee was appointed to take the initial steps, and the hope was expressed that the museum would really be confined to the county, and not become a general collection of curiosities.

The Scottish Education Department have announced to the Edinburgh Town Council that they are disposed to favourably consider an application by the Town Council for funds for the proposed art school for Edinburgh. The Department, would like to know, however, as soon as possible, what the Corporation propose doing to carry on the school in the meantime, and what they suggest for temporary school premises, and particularly when they will be in a position to say anything about the provisional committee it is proposed to form to carry on the school. Dr. Struthers, it is stated, will be in Edinburgh in the beginning of June, and will be glad then to consult with the Council's committee should they so desire it.

A Stained-Glass Window has been opened in Tewkesbury Abbey, of which the inscription records:—"To perpetuate the memory of a true master builder, five times Mayor of Tewkesbury, honorary freeman of the borough, always zealous in preserving the ancient beauty of his native town, the builder of numerous churches and the restorer of this venerable abbey, the friends of Thomas Collins, J.P., born August 26, 1819, died January 3, 1900, have placed this tablet here and a stained-glass window in the western side of this transept in the church he loved." Cut in the alabaster border itself at the base are the words, "A workman needeth not to be ashamed."

The Cape Town municipal authorities passed plans for new buildings in the city to the value of 22,000*l.* between February 10 and March 31. During the same period plans for new buildings to the value of 185,970*l.* were examined and rejected.

The Committee of Kirkintilloch Conservative Association who recently invited designs for premises have selected from the thirty-one designs submitted in competition that of Mr. Wm. Baillie, architect, 223 Hope Street, Glasgow. The building, which is to be of three storeys with basement, will cost about 2,000*l.*

The Sixteenth Exhibition of Pictures will be held at the Borough Polytechnic Institute, Borough Road, S.E., from May 26 to June 17. Among the pictures are works by Turner and David Cox, Sir Edward Poynter, Bart., P.R.A., Sir James Linton, R.I., Alfred East, R.A., J. MacWhirter, R.A., David Murray, R.A., G. Clausen, A.R.A., J. Farquharson, A.R.A., G. A. Storey, A.R.A., Edward Stott, A.R.A., Hon. John Collier and other well-known painters.

The Corporation of the City of London has presented to the Society of Architects a complete set of the commemorative medals which it has struck from time to time during the last seventy-five years. The medals, of which the following is a list, will be placed in the Society's reading room:—1831 London Bridge, 1831 London Bridge, 1832 Reform Bill, 1834 City of London School, 1837 Queen's Visit, 1849 Coal Exchange, 1855 Emperor of the French, 1855 King of Sardinia, 1863 Princess of Wales, 1867 Sultan of Turkey, 1869 Blackfriars Bridge, 1872 Thanksgiving, 1873 Shah of Persia, 1874 Emperor of Russia, 1878 Temple Bar, 1880 King of the Hellenes, 1882 Epping Forest, 1882 New City of London School, 1884 New Council Chamber, 1885 Prince Albert Victor, 1886 Colonial and Indian Reception, 1887 Queen Victoria's Jubilee, 1889 700th Anniversary of the Mayoralty, 1891 Emperor of Germany, 1893 Duke and Duchess of York, 1893 King of Denmark, 1894 Tower Bridge, Queen's Diamond Jubilee, City Imperial Volunteers, King and Queen's Visit.

St. John's Church, Sleekburn, was consecrated by the Bishop of Newcastle on Saturday. The church is of brick with local stone dressings. The two aisles are divided from the nave by seven stone arches. The early Perpendicular west window has seven lights and the east window three. The mosaic pavement with marble steps to the chancel was supplied by Messrs. Emley & Sons, Ltd., Newcastle-on-Tyne. The plans for the church were prepared by Mr. Arthur B. Plummer and carried out by Mr. T. Goulding, contractor.

The Architect.

THE WEEK.

NOVELISTS sometimes represent heroic young partners in a factory who deal with strikes in a dauntless manner by bringing "hands" from some distant place. Although English law is not favourable to strikes, it does not approve the least irregularity in any measures which have to be taken to counteract them. An instance of this peculiar impartiality has been afforded in Bolton. This year there was a strike in one of the big mills, in which women workers shared. Successors were found to take their place, but they found it difficult to endure the jeering of the people in the streets. It was therefore decided to make the women as comfortable as possible in the mill in order to diminish the necessity for going out of doors. The third storey of a warehouse was converted into a dormitory to accommodate from 100 to 200 young women, and the sanitary inspector described it as large, lofty and well ventilated. A new gymnasium became a dining-room. Both acts were, however, contrary to the by-laws. The usual notices and plans had not been given. The company who own the mill were accordingly summoned for two offences. It was argued on their behalf that the warehouse was not converted into a dwelling-house, which Chief Baron KELLY defined as a place where a man sleeps at night and uses for the purposes of his house in the daytime. There was no structural alteration, and therefore no "conversion" as required by the Act. The assistants were free, and all that was done was to save them from insults. The magistrate had to declare that the conversion of a warehouse floor into a dormitory was a breach of the by-laws. A fine of 40*s.* with costs was imposed. The second summons was not heard. A case was applied for. It would, no doubt, be easy to avoid such an offence by giving a fortnight's notice. But trade disputes resemble battles, and time is an important consideration. The possibility of meeting a difficulty without any delay is impressive. The law, however, does not recognise distinctions, and, as the architects know to their cost, the higher Courts usually uphold by-laws against all opposition.

IT is very seldom that such a numismatic treasure has rewarded research as one which was found last week by a French priest close to the ancient Roman highway between Evreux and Chartres. In an earthen pot he discovered no less than 2,400 pieces bearing the effigies of JULIUS CÆSAR, AUGUSTUS, MARCUS AURELIUS, SEPTIMIUS SEVERUS, ADRIAN, GORDIAN, ALEXANDER SEVERUS, COMMODUS, and of the Empresses CRISPINA, LUCILLA, FAUSTINA. What increases the interest is the variety of exergues. There are besides medallions which commemorate various battles. Evreux, which was the ancient Mediolanum Aulercarum, has a museum of antiquities in which many varieties of Roman work are exemplified. The coins, which are all in capital condition, will probably be added to the collections.

THE river Clyde would not be libelled if at one time it had been described as malodorous. Science has not as yet discovered any appliance which would reveal the degree of offensiveness in the air. Otherwise it would be curious to compare the relative degree of suffering which passengers in vessels had to endure while passing along the Thames and the Clyde. Indeed, the state of the great river of the north used to make some archæologists declare that the salmon which appear in the city arms were not Clyde salmon, but symbols relating to something else. Since Glasgow has taken to sanitary works it has carried them out with characteristic energy. BATEMAN'S scheme for conveying water from Loch Katrine appeared to many English municipal authorities as a financial impossibility. But its success caused other cities to endeavour to imitate it. The main drainage is another vast work. The late JOHN CARRICK, architect and master of works, had the courage to suggest a system of sewerage by which the Clyde would be superseded. Two-thirds of the work have been carried out, and the final section was commenced on Monday. The whole of southern Glasgow, with Govan, Pollokshaws and Rutherglen, and other places within an area of 14 square miles, will be improved sanitarily when the new works are completed. The Clyde will also cease to be offensive. The works will be directed by Mr. A. B. M'DONALD, who was an assistant of Mr. CARRICK, and has been long connected with the improvement of the sanitation of Glasgow.

THE Brandenburg Gate in Berlin was erected towards the close of the eighteenth century, and was rather suggestive of the city and of Prussia. It is a severe structure in Roman Doric, presenting six columns to the spectator on both approaches. It is surmounted by a quadriga of Victory in a chariot drawn by four horses, which was carried off by the French in 1806 and surrendered after the downfall of NAPOLEON. The building was flanked by two small houses similar in style, one of which was used as a toll-house and the other as a guard-house. Practically it continues the line of the buildings on both sides, and when it was erected it marked the boundary of Berlin. The wide roadway, Unter den Linden, opens out into a square before the gateway, which is known as the Pariser Platz, and thus recalls the part taken by the Prussians in conquering the French capital. Since 1814 Berlin has largely increased its area, and the Brandenburg Gate has not only ceased to express the boundary, but it is an obstacle to the fine view which might be obtained from the Schloss Bridge and the memorial of the first emperor. It has therefore been proposed to remove the buildings which adjoin the gate. There is no longer a necessity to examine and tax goods on entering the city, and the small customs house is now a telegraph office. A great many artists are opposed to the scheme, because it would alter an arrangement which has lasted for nearly 120 years, which in a new city like Berlin is a long period. The Architects' Union of Berlin has formally passed a resolution in favour of the continuance of the present arrangement. The gate has now a character of its own, and an alteration would suggest a desire to imitate the Arc d'Etoile in Paris, although the two structures are unlike. A part of the official scheme is to construct a tunnel beneath the Platz, in order that the existing street railway might not interfere with the severity of the structure.

THE médaille d'honneur for architecture at the French Salon (Société des Artistes Français) has been awarded to M. JULES A. GODEFROY. First-class medals have been gained by MM. YPERMAN and REY, second-class medals by MM. VENTRE and BANS, and third-class medals by MM. REMAURY, LEFORT, EBRARD, BOUTIN, PIÉRON, LEPRINCE-RINGUET, HAUBOLD, LANSBURGH and FÉVRIER. Among the "mentions honorables" in architecture is the name of Mr. ARNOLD MITCHELL, who was represented by his designs for a villa near Ostend for the King of the BELGIANS, and for a house near London. In the section of painting M. ROCHEGROSSE, who produces pictures on an immense scale and mostly of subjects from ancient history, has at length obtained the médaille d'honneur. Mr. BERNARD F. GRIBBLE, for his *Ship Attacked by Salee Rovers*, and Mr. JULIUS OLSSON, for his *Twilight*, have been honourably mentioned. Similar recognition rewards Mr. W. LEE HANKEY and Mr. W. H. FRITTON. Mr. A. S. COPE has been awarded the Prix Rosa Bonheur. The principal reward for sculpture was given to M. ANTONIN CARLÈS, and for engraving M. FOCILLON was elected.

FLEMISH PAINTINGS.

THERE are now to be seen in the Guildhall Gallery works by more than eighty artists of the Flemish school. As the series begins with the VAN EYCKS, and comprises examples of painters who are living, it can be accepted as representative of that venerable school. With other schools it would be absurd to suppose that a couple of hundred paintings could be suggestive of their history. We have only to imagine how insufficient the number would seem in the case of the English school, with every artist endeavouring to become an innovator. But in Belgium there is not only a long line of traditions in art, it is, moreover, respected. One result is that collectors can bring together examples of different centuries, and their galleries have more unity than is possible in this country, although the English school has not existed for more than a century and a half.

We may even go so far as to assert that a single work by one of the able Flemish or Belgian masters is sufficient to recall the characteristics of the class of painting to which it belongs. For that reason we publish this week a reproduction of the painting by the late ALBERT DE VRIENDT, *Homage Rendered to the Infant, Charles the Fifth*,* which, with its neighbour, *A Martyr of the Sixteenth Century*, by Professor GEETS, appear to be most attractive to the crowd of all the pictures in the Corporation Gallery. To those who have not given attention to the peculiarities of Flemish painters the figures are likely to appear strange. The faces especially are not of the kind which are usually found in historical pictures. When historical painting received more attention than it does at present it was considered essential that even supernumeraries should be handsome men and women, that is to say, idealised. As REYNOLDS said, "the artist is supposed to have ascended the celestial regions to furnish his mind with the perfect idea of beauty," and he quotes PROCLUS for the maxim that "he who takes for his models such forms as nature produces, and confines himself to an exact imitation of them, will never attain to what is perfectly beautiful, for the works of nature are full of disproportion."

ALBERT DE VRIENDT did not adopt that belief, and he was warranted by the precedents established by ancient masters of his school. In the earliest paintings in the Guildhall Collection we see a respect for realism, and we cannot fail to come to the conclusion that the subjects, however exalted, are portraits, it may be, slightly adapted for the office they hold, but still leaving the impression that contemporaries could recognise the originals. The length to which this fidelity can go can be seen in the small works by M. JAN VAN BEERS. Some years ago he startled Paris by a portrait of his father, which in minute reality of details was not approached by any of the French Primitives. But since those days photography has suggested a manner of expressing realism which was unknown before. M. JAN VAN BEERS occasionally wishes to exasperate authoritative personages, and his *Shepherdess* of the time of LOUIS XV. and his portrait of SARAH BERNHARDT would be declared to be photographs by an ordinary dealer. But the artist, with his enviable delicacy and sureness of hand, is only expressing realism in a style which to many would be erroneous.

There are three artists who were commonly supposed to be the chief representatives of the Flemish school, but who in several ways departed from its traditions. They are RUBENS, JORDAENS and VANDYKE. RUBENS studied in Italy and he copied works by several of the great Italian masters. Indeed, the competition cartoon by DA VINCI is only known from an engraving after his drawing. Like all able artists, he could not make a copy of even the simplest work without imparting to it some of his own characteristics. But, on the other hand, he was taught in Italy how more time could be gained by simply imagining figures and faces than by painfully copying them from nature. Occasionally when the humour had seized him he would be at the trouble to suggest personal peculiarities, and when painting portraits of great people he had to appear as if desirous of being faithful. But it would be impossible for RUBENS to have produced such a number of figures if he had adhered to the old Flemish system. That, we might say, was the system of miniaturists, who were very slow, and who rejoiced when they had completed an initial letter. The popular belief about JORDAENS is that he was not only a Fleming, but the coarsest among them. In his portraits and church paintings he was as dignified as RUBENS. His peasants are not, however, related to those that we see in works of earlier masters. VANDYKE's Flemishness would be difficult to discover. His *Rinaldo and Armida*, which is in the collection, is essentially Italian and would find approval in the eyes of TASSO as a worthy illustration of his work.

The three artists we have named also favoured the production of large pictures. Now the early masters of the Flemish school, as we can see from the examples in the Guildhall Gallery, preferred to work on small panels. There is a portrait by HUBERT VAN EYCK which measures 9 inches by 6½ inches; and a *Virgin and Infant Christ* by his brother JAN VAN EYCK, which is 9 inches by 6 inches. Certainly there is a triptych by JAN which is of larger size, and if all the parts of the great *Worship of the Lamb* by the brothers (which was in Ghent) could be brought together, as has been proposed, the dimensions would be surprising. But the largest of the panels, which remains in the cathedral, is only about 7 feet in length. Size has an important connection with the history of Flemish art. No doubt there were paintings produced during the long sojourn of the Romans and during the early Mediæval period. But what we know as Flemish art really started about the end of the thirteenth century, when the burghers realised that union was strength, and when they acquired privileges by paying for them or fighting for them. Then they found they could have personal possessions, and they enjoyed painting in the form of scriptural scenes which they could place in their little oratories, and portraits of themselves and their relations. The great portrait by JAN VAN EYCK which we have in the National Gallery is a memorial of a man and a woman—and we may add a dog—which may be said to have conferred immortality on those who had paid for it. It is curious to find among the early paintings that one of the most remarkable is the *Enthronement of Thomas à Becket as Archbishop of Canterbury*, which was painted in 1421, and is the earliest known picture of JAN VAN EYCK.

The modern painting by EMILE WAUTERS, which is in the Brussels Gallery, of *The Madness of Hugues Vander Goes*, imparts interest to the *St. Victor with a Donor*, for the old painter's works are not known in England. There are some doubts about the authorship, but it certainly appears to be a Flemish work of the fifteenth century. There are two other works by the artist. HANS MEMLING owes much of his renown to the pretty story about his rescue and his painting the shrine in the hospital at Bruges in return for the kindness he received. It appears, however, that he was a prosperous gentleman. The largest of the four works ascribed to him in the collection is a triptych, in which it appears are portraits of Sir JOHN DONNE, of Kidwelly, Carmarthenshire, Controller of the Customs of Bristol, and his wife, ELIZABETH, youngest daughter of Sir LEONARD HASTINGS, of Kerkby, and sister of WILLIAM, first Lord HASTINGS, Lord Chamberlain to King EDWARD IV. The early paintings in the first gallery surprise by the brilliancy of the colours. Some may have been repainted and others restored. But those operations are not sufficient to explain the brilliancy which is so general. The Flemish guilds were without professors of chemistry, but they dis-

covered means of endurance, some of which are unknown even in modern Belgium.

In the second gallery there are three portraits by FRANS HALS which appear to be so easily produced they resemble scene-painter's work, as if they were to serve for an "interior." The portrait of that erratic warrior, the Earl of PETERBOROUGH, by VANDYCK, is again displayed. But it is so out of scale with the majority of the works, the subject appears to be a giant. The *Interior of a Church*, by PETER NEEFS, compels one to ask how much is reality and how much imagination.

The modern works are likely to be the most popular. *Art and Liberty* is a small study for a painting that was made familiar through lithography. Another repetition of one of GALLAIT'S works is the *Têtes Coupées*, or the last honours of the Brussels marksmen to Counts EGMONT and HORN. They were two of the victims of D'ALVA'S tyranny, and both are shown lying as if in bed, with the decapitated heads attached to the bodies. GALLAIT avoided archaicism of treatment, although he preferred historical subjects. All or any of his works might have been produced in the atelier of DELAROCHE. By Baron LEYS is *Martin Luther Reading the Bible to his Companions*, which is one of his characteristic works. He is one of the most important figures in the history of modern Flemish art. Although he modified the Flemish tendencies which were strong with him, his style of composition shows respect for modern canons. *Life's Frailty* and *The Evening of Life* by THÉOPHILE LYBAERT show the perfection of handling which is attainable in Belgium. The old woman who was the subject of the second painting might have been carved in ivory, and, however we may scrutinise, a brush stroke is not to be discerned. WILLIAM LINNIG, jun., would be taken as only a painter of still life, from his *After the Wedding*, which represents a breakfast table when the guests have left; but his *Soothsayer; Temptation of St. Anthony*, and *Rabelais* show skill as a figure-painter.

No collection of Flemish paintings is complete without a group of dogs by STEVENS. In the gallery there are only two, but they show his skill in that class of work. *A Calm* by CLAYS is another necessity which is gratified. Professor GEETS in *A Martyr of the Sixteenth Century* represents one of those scenes which could be enacted in Europe in that troubled age. The kind of death that awaits her—*i.e.* burial alive—is indicated by the tools which are carried in order to open the ground. HENRI DE BRAEKELEER was mainly a painter of still life, but still life with him did not mean the humblest class of art as it is supposed to be in this country. The *Atlas* in the Brussels Museum, showing a man endeavouring to discover a place on a map in a colossal volume, and who is surrounded by old lanterns and lamps, is one of the pictures which remain in the memory when seen. There are five of his works in the Guildhall Gallery. The colours are faded in the *Girl Reading*, but the view from an open window, called *Antwerp*, the Maison Hydraulique, the hall of the Brewer's House and the properties of the studio are all in a perfect state, and are marvels of careful drawing and light and shade.

ALFRED STEVENS is so modern, and is so much appreciated in Paris, it might be supposed that he is foreign to the principles of the elders. But the main difference is that he painted in the nineteenth century while they painted in the fifteenth. If hereafter some historian of social life—it may then be a lady—should wish to know what *frou-frou* signified, and why it should give rise to a class, it will be only necessary to look up some of the artist's paintings. The Indian shawl which is represented in *The Visit* manifests his delight in textiles, of which we see different varieties in *L'Accouchée*, *The Lady in Grey* and *Fedora*. In his appreciation of millinery he resembles GAINSBOROUGH.

There are other painters whose works will repay repeated visits to the Guildhall Gallery. In seeing them all lovers of art are likely to desire that those among them which could be purchased should remain in this country. In England the power of individuality is unfavourable to unity. But that unity has power possessing many advantages is shown in this collection, brought together almost by chance, no less than in the public galleries of Belgium.

SCIENCE BUILDINGS IN UNIVERSITIES.

ONE of the differences between ancient and modern universities arises from the greater importance which now belongs to buildings. If Athens can be considered as the ideal university, it managed to succeed without any aid from special buildings, for the greater part of the teaching was given out of doors in groves or when weather was unfavourable in porticoes. In the Mediæval universities the same principle was recognised. Everything depended on the professors, and they resembled, to some extent, our modern street preachers. They generally insisted on payment, however small, before their lectures, for experience was likely to have taught them that collections afterwards were not generous. The legend of the two itinerant Irish scholars who attracted the attention of CHARLEMAGNE by crying out in a city where he happened to be present, "Who wants wisdom? Who wants wisdom? Let him come to us, for we have it to sell," brings before us the simple manner in which knowledge was retailed. Books were cumbrous and costly, and could not be carried about. It was therefore necessary for every one who set up for a teacher to have a retentive memory, in order to be able to explain whatever was known about his particular subject. As a consequence the professors were specialists, and in such a city as Paris, where there was competition on a grand scale, a student attended whoever was able to give him most value for the money expended in fees.

The students were not loyal to any one school. Although a journey in the Middle Ages was dangerous, yet men were not daunted in travelling through Europe in search of knowledge. Bec, in Normandy, was more remote as regards accessibility than parts of Africa are now, but it was so famed as a school of logic, many students were attracted to it from Italy and elsewhere. ABELARD gained reputation in Paris as a teacher and disputant. When he was compelled to leave the city he continued to be followed; wherever he was driven crowds of youths who were eager to be taught awaited him, and when he took refuge in a forest they erected huts to shelter themselves with branches of trees. Students from Paris were no doubt acquainted with discomfort, for there was no provision for lodgings in the houses in the narrow streets which corresponded with the accommodation which subsequently was available in Oxford and Cambridge. At the latter city, if we believe WOOD, the university began in a common barn, and the students lived where they could, but in a short time there was no necessity to suffer privations.

While the three or four arts (the Trivium or Quadrivium) or even the seven arts of grammar, rhetoric, arithmetic, logic, geography, astronomy, and the science of music were taught, there was in theory at least no call for any buildings except for lecturing, examinations and administration. The professors were supposed to represent the whole extent of what was knowable. Nor was the monastic system of residences for students within collegiate enclosures indispensable. The London University shows what can be accomplished by a departure from ancient arrangements. On the Continent there are several universities which are also without means for housing students. Opinions differ on the subject, but in this country it is believed that the system which existed in Oxford in the thirteenth century of a sort of family life through the agency of colleges is best adapted to the nature of Englishmen.

Apart from buildings of that class a modern university must provide others which will correspond with

Digitized by Google

the most recent curriculum. That has become a necessity which the authorities of old universities have imposed by their own acts. They could have continued to restrict their teaching within the limits which were known to Greeks and Romans and Mediævalists. For many men the old Academic arts continue to be as excellent a training for the duties of their stations as they were proved to be in the old days. Prior to the seventeenth century the inhabitants of the world, whose education was confined within narrow limits, were not "mostly fools." But the monopolising spirit was not absent from universities, and when the new sciences were announced they were supposed to be allied to the old arts, and provision was made for teaching them if not effectually at least academically. The consequence is that a university must recognise the growth of science or the appearance of new sciences and provide for their exposition.

What that means is now being exemplified in Paris. The university of that city, in a historical sense, is perhaps the most interesting example of its kind in the world. It is supposed to date from the eleventh century. The Sorbonne, which was for long the theological section of the university, and is now commonly taken for the university in its totality, is a creation of the thirteenth century. Everything in the form of education which exists in France, with the exception of some branches of the fine arts, comes under the surveillance of the university. Sciences, literature ancient and modern, law, medicine, schools, colleges, may be said to derive their character from its spirit, and they change in proportion to the changes of the Council.

For a long time the university of Paris appeared to be a dormant authority to the majority of Frenchmen. Professors and other teachers knew by experience how troublesome it could be, and that it was always ready to pounce on them. The popular belief was inspired to some extent by the university buildings. They were used partly for offices, partly for gratuitous lectures and distributions of prizes. It might be imagined they were shelters for poor people who were without occupation, but contrived to exist. The creation of M. NÉNOT's new Sorbonne some twenty years ago took the whole Quartier Latin by surprise. It demonstrated that it was to serve new purposes and that educational affairs were to be revolutionised. The new building was more successful than was anticipated. The lectures were attended by larger and more intelligent audiences, and the action of the educational authorities excited more attention. Already it has been demonstrated that the Council of the university were not sufficiently sanguine, for the buildings are not extensive enough for their uses.

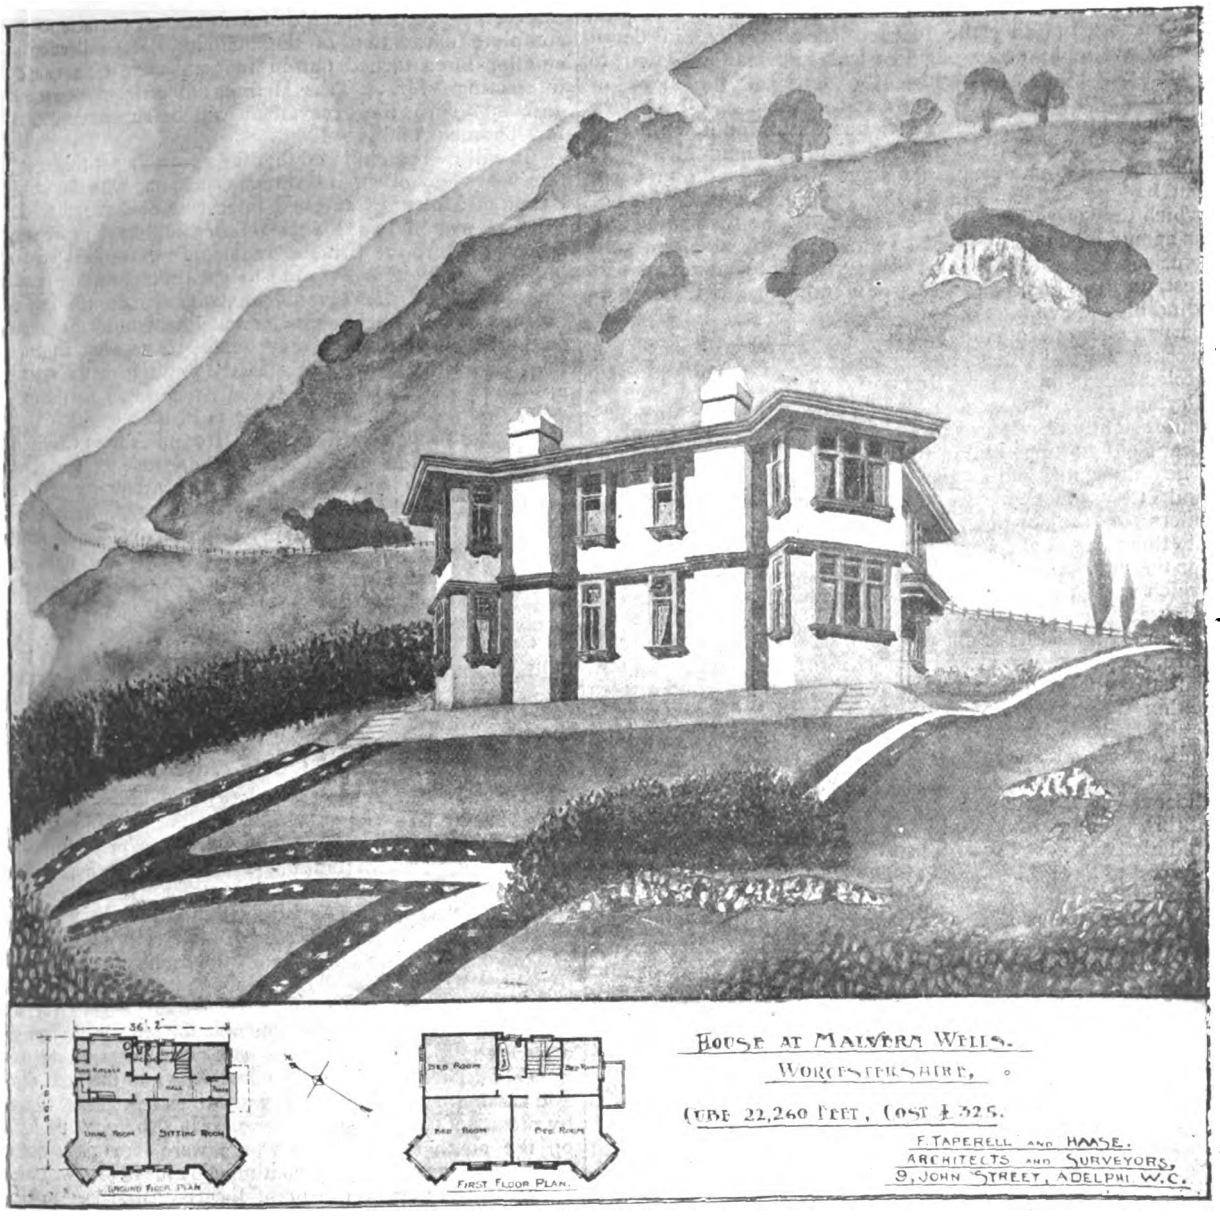
It is strange to find the Sorbonne now identifying itself with science instead of theology. The decisions of the doctors were at one time awaited with anxiety in courts as well as convents, and it was through one of their opinions that JOAN OF ARC was condemned to the stake. In these days the greatest anxiety is to provide new buildings where special sciences can be pursued. Two years ago it was announced that the evolution of organic beings was taught in one inadequate building, applied chemistry in another, applied mechanics on the third floor of a house to which apparatus could not be hoisted. Then archæology as a science was neglected, because there was no room for collections, and although the late M. CURIE, who, with the aid of his wife, had discovered radium, was appointed a professor, it was impossible to find a place where he could teach.

There was a time when such deficiencies would be unheeded, but at present France is not behind other countries in confidence about the material advantages with which science can reward its votaries and promoters. As sometimes happens when the necessity is pressing, a site having all the advantages which are desirable offered itself. In the heart of the Quartier Latin, between the Panthéon and the Ecole Normale, is a very large garden attached to a convent which was a reformatory for women. The nuns, who were not affected by the law against religious orders, desired to remove outside Paris, and the land was for disposal. It did not require much diplomacy to obtain an agreement from the French Government and the Municipal Council of Paris to the purchase of the ground by the university authorities and to spare the expense.

No time was lost in giving a commission to M. NÉNOT for the preparation of plans for an institute of applied chemistry. Fortune favours the brave, and M. LIARD, the vice-rector of the university and president of its Council, discovered that the Prince of MONACO, who is an enthusiast for oceanography, was eager to have the new science brought within the sphere of the university. He has given a large sum which will not only pay for the site but for the erection of a building. After so much success there is not likely to be a long delay before a laboratory for the study of radio-actives will be erected and placed under the direction of Madame CURIE, as well as an archæological museum. The Cluny Museum is close to the Sorbonne and the proposed buildings, but although there are valuable collections in it they belong to a limited period and would not serve the purposes of a professor of archæology in general.

The buildings which are about to be erected will, of course, be followed by any others which are necessary. Literature can be taught in classrooms or in gardens. But the sciences need laboratories and museums which have to be specially planned. Without that aid the knowledge acquired is likely to be merely verbal and useless for application. The inquiries which have lately been gone through respecting a college of science at South Kensington reveal how much has to be done if Great Britain is to compete with foreign nations. The universities have also to meet the demand by the erection of special buildings beyond those which now are made to serve, otherwise it would be preferable to abandon the teaching of science and to fall back on subjects which are independent of the aid of architects and builders.

HOUSE AT MALVERN WELLS.



THIS cottage has been designed to meet the requirements of a cheap substantial building to cost not more than 350*l.* The walls and partitions are built of local bricks; the external walls rendered with cement, finished with pebble dashing, the upper part coloured a light cream and the lower a natural grey. The woodwork is generally square or chamfered, the external woodwork stained a dark oak and varnished. The ground floor is finished with 1¼-inch grooved and tongued boarding, nailed to the cement concrete. The roof a concrete flat constructed with small steel joists 3 feet apart and coke breeze cement concrete, finished on top with two layers of half-ply Ruberoid cemented down; the eaves project 2 feet 3 inches all round. An alternative estimate for a batten and tiled roof was obtained, and it was found that the flat roof effected a saving of 35*l.* All rooms are 8 feet 6 inches high in clear. The cube of building, measured from bottom of brick footings to top of flat, is 22,260 feet. The contract price is 325*l.*, which is about 3½*d.* per foot cube. In this case no concrete was necessary under the brick footings owing to the ground being rock.

The London County Council have approved the expenditure on capital account of 2,000*l.* in respect of the preparation of plans and estimates in connection with the proposed erection of a new asylum on the Horton estate, Epsom.

Sir Thomas Gibson Carmichael has been appointed a trustee of the National Portrait Gallery in St. Martin's Place, in succession to the late Dr. Richard Garnett. Sir Thomas is on the committee of the Burlington Fine Arts Club, and is a member of the Board of Manufactures, who are trustees for the National Galleries of Scotland.

BERKS ARCHÆOLOGICAL SOCIETY.

THE annual meeting of this Society was held last week, Mr. C. E. Keyser, M.A., F.S.A. (president), in the chair. The annual report stated that the Victoria history of the county is progressing satisfactorily, and the first volume is now in the hands of the binders, and may be expected by the subscribers very shortly. The committee secured from the Corporation of Reading the room at the Abbey Gate at a rental of 5*l.* per annum, and purchased the fittings for the sum of 4*l.* This room will be devoted to the purpose of a library. The question as to the repair and decoration of the Abbey Gate has occupied attention. It was felt, however, that before the Society spent any money on the building the committee should have a more secure tenancy than they at present have from the Corporation. The Corporation has expressed its willingness to grant a lease of seven or fourteen years on condition that the sum of 50*l.* be spent in decoration, and that some necessary internal repairs, the cost of which has been estimated at 38*l.*, be undertaken by the Society. At Silchester progress has been made with the excavations, and some interesting buildings in Insulæ V. and VI. have been brought to light, and other objects which will be exhibited at Burlington House on June 6 to 19, will ultimately find their way to the Reading Museum. Mr. Keyser was re-elected president by acclamation.

The Rev. Alan Cheales then read, says the *Reading Mercury*, a paper on "St. Edmund's Chapel, Reading, 1284-1906: Lost and Found." Antiquaries, he said, sometimes scored a success, and were sometimes cheered by an unexpected discovery, by a bit of old-time life being reproduced before them, a lost locality recovered or an almost forgotten name suddenly brought into prominence, as in the present instance, by the quite unexpected regaining of a long-lost feature of the ancient town of Reading in the relics of an ecclesiastical building of the thirteenth century, namely, of the remains of St. Edmund's Chapel, which was founded in 1284—some 160 years after the great abbey—and had gone through even yet more striking vicissitudes. St. Edmund's Chapel, with its hermitage, once stood at the end of Friar Street, slightly west of the present parish church of Greyfriars, and was dedicated to the last king of East Anglia, who was specially commemorated at Bury St. Edmunds, and was martyred in 870 by the Danes, who about the same time swooped down upon Reading and did no little mischief. It was some 400 years later when the little town which the Danes had burned was rapidly rising into note under the fostering wing of its great abbey that Reading revived also the martyr king's memory, worthy Laurence Burgess, "Bailiffe of Reading," then founding St. Edmund's Chapel, and building near to it a hermitage, to which he presently retired. It was founded in 1284, desecrated in 1479 by Abbot Thorne I., made into a fort in 1643 by Sir Arthur Ashton, then governor of Reading, and taken down and rebuilt at Battel Farm in 1790. After that it was utterly lost sight of, but was finally refound in the present year by Mr. Dryland Haslam. The chapel, a pretty and graceful specimen of thirteenth-century work, was on the hillside sloping down to Caversham, upon the triangular piece of ground near Greyfriars now so singularly, after all these years, again standing unoccupied. Of the hermitage there remained

Digitized by Google

neither trace nor tradition, but the site of the chapel was still given upon Ordnance maps. Of the history of this interesting building the learned essayist gave in detail every available scrap of historical information down to 1894, when he was writing the story of the siege of Reading. Being greatly interested in the chapel-barn-fort, he then inquired and searched, but could find no sufficient records of what had become of it. His friend Mr. W. T. Bilson, with great antiquarian acumen, had fixed on a barn, but had no sufficient proof then that it was the barn of which they were in search, and he applied to the firm acting as agents for the Battel estate without being able to obtain precise information. For twelve years the matter was at rest, until suddenly, some two months ago, a benevolent wind blew down part of the side of one of the Battel estate barns, and out of the *débris* there tumbled a mass of worked stones which had evidently formed part of an ecclesiastical building. Instantly it flashed upon Mr. Dryland Haslam that the broken barn was the St. Edmund's, and instantly also he received a full answer to his twelve-year's-old inquiry and the chapel-fort-barn was located. The museum authorities were communicated with, and they eagerly availed themselves of the polite offers of the owner, Mr. Saunders, to put the find at their disposal. They chose the best of the stones for the museum—portions, apparently, of a marble pilaster, which were now to be seen in the store-room of the Berks Archæological Society at the Abbey Gate. There was no longer any possible doubt as to the site of the chapel-fort-barn, which they would find in a farmyard a few hundred yards to the right of Oxford Road, on the Battel estate, within the grounds of Battel farmhouse. As the photograph Mr. Cheales handed round showed, it is a fine old building still, about 25 paces long by 14 wide. The thirteenth-century roof had unhappily been replaced by a hideous covering of corrugated iron, which replaced a roof of thatch, which replaced the roof of wood which Mr. Bilson told him was destroyed by fire. The character of the roof seemed to have been retained, as was suggested to him by an architectural friend, and its high pitch might have been not unlike the roof of Greyfriars, which was erected in 1311, about 127 years after St. Edmund's. He knew of no abbey relics in the way of stonework, except the font-stem now in St. James's Roman Catholic chapel, that could compare with the wonderfully-preserved marble of the pilasters of St. Edmund's, from which they might gather that the original chapel was a building of no mean proportions. After Abbot Thorne's desecration, and the unpleasant siege experiences, might they not believe that Laurence Burgess's troubled spirit had been at last laid at rest by the latest occupants of his chapel's site? A Gospel mission had been recently conducted on the very spot, and a mission tent had been standing there. Above "the bonys," as they assured King Edward, "of many Chrysten people," once more had been heard holy hymns and Gospel teachings, readings from the Holy Book, and stirring addresses, with thronging crowds of eager worshippers reconsecrating it. The ground might be built over, and probably would be, but it could never again lose its double memory of the bad times of the Fourth Edward and the good times of the Seventh.

The Rev. P. H. Ditchfield then read a paper on "The Ceilings of Walsingham House," which formerly stood at the corner of Minster Street, Reading.

EXCAVATIONS AT CAERWENT.

THE work of excavation at Caerwent (the Venta Silurum of the Romans) is to be resumed very shortly. Since autumn Lord Tredegar (who is president of the excavation committee) has, says the *Manchester Guardian*, purchased the property adjoining a portion of the site, which was yielding specially interesting results, and he has also bought a large grass field in the north-east part of the city, which will add about five acres to the area available for excavation. The cost of the operations last year amounted to about 250*l.*, and the committee are again appealing confidently for support. An official report of this work, which will shortly be issued, will contain a detailed account of the excavation of the southern gateway, which seems to differ in some important particulars from the northern entrance. The other discovery of special interest during 1905 was that of a curious octagonal tank or bath. Some distance to the north of this structure a fine hypocaust was uncovered two years ago, and it is thought the two may have formed part of a public bath, but an intervening garden has hitherto formed an obstacle to the complete excavation of the building. The collection of smaller finds turned out in 1905 was more than usually interesting. Mr. A. Trice Matin is still acting as secretary, and, as before, the excavations will be superintended by Mr. Thomas Ashby.

It will be remembered that the unearthing at this spot a few years ago of an inscription concluding with the words "Civitas Silurum" afforded important evidence that the cantonal system was in use in Britain. In a paper read recently before the British Academy, Dr. Haverfield pointed out that while it is possible to discern the working of the cantonal system at several points in Britain, the British cantons were probably smaller and less wealthy than those of Gaul. He thinks this may be the reason why, although many inscriptions testifying to the working of the system are found in Gaul, this Caerwent stone is so far the only epigraphical evidence discovered in Britain.

Though Caerwent lies only a few miles from Caerleon, the Isca Silurum of the Romans, and one of the three great legionary camps, it affords very few traces of a military occupation. In the light which they throw upon the civic life of the Romans in Britain, however, these remains may perhaps claim a place beside those of Silchester, and as the plans of the buildings in both instances are being drawn to the same scale, a comparative study of the two will be of interest.

The site is within easy walking distance of the Severn Tunnel Junction on the Great Western Railway.

CHEVENING HOUSE AND CHURCH.*

THE late Canon Scott Robertson, in an address to the Kent Archæological Society in 1884, described Chevening House as a structure of three periods. First, the central, or main building, was erected by Inigo Jones between the years 1616 and 1630 for Richard Lennard, thirteenth Lord Dacre of the South, whose grandson, Thomas Lord Dacre, was created Earl Sussex by Charles II. On his death, failing male issue, the estate was sold by his daughters (1717) to General Stanhope (grandson of the first Earl of Chesterfield), who was created Earl Stanhope in the following year. Secondly, the first Earl Stanhope (James) added shallow wings to the east and west sides of the house, and erected large detached wings to the north-east and north-west of Chevening, with which he connected them by means of two curved galleries. He also formed the lake on the south side. These works were incomplete when he died in 1721, but were continued by his widow, who was Lucy Pitt, aunt of the great Earl of Chatham. In the third place, Charles, the third Earl Stanhope, who held the title and property from 1780 to 1816 (thirty-six years) hid the red bricks employed by Inigo Jones with a facing of cream-coloured mathematical tiles, and also added the stone pilasters upon the front and all the stonework about the front door and basement.

On entering at the hall the visitor's admiration is kindled by the beautiful fairylike circular staircase, which was constructed by the first Earl Stanhope and was finished about 1722. It is of old oak and has fifty-six steps—twenty-eight in each tier.

The arms which form trophies on the walls belonged to a disbanded regiment of militia, and were given to Thomas Pitt, Earl of Londonderry, brother of the first Countess Stanhope. The muskets and pistols were all made in Dublin during the reign of Queen Anne.

On the east wall a fine suit of armour, inlaid with gold, is flanked by two trophies, each consisting of forty-eight swords, inlaced like latticework. Flanking these are trophies formed each of thirty-two muskets. Around the helmet is a circle of twenty pistols, and similar trophies are above and about.

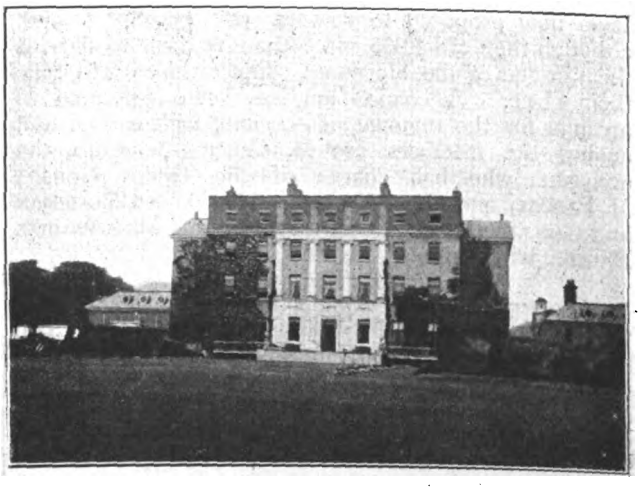
The house is one vast library of rare books, and is stocked with valuable relics and curiosities, including the telescope used by the Duke of Wellington at Waterloo and a snuff-box carried by the first Earl Stanhope on his campaigns. There are also many family and other portraits, and in one of the sleeping-rooms is an Elizabethan bedstead from Hever Castle. Lady Stanhope's boudoir is entirely hung with exquisite tapestry presented in 1708 to General Stanhope (first Earl) by Frederick I., King of Prussia.

* Paper by Mr. W. T. Vincent, read at a meeting of the Upper Norwood Athenæum on May 19.

Digitized by Google

One bedchamber is known as the Chatham room and contains portraits of William Pitt and others, also a mirror with the monogram of Thomas Pitt, father of the first Countess Stanhope. The family is naturally proud of its connection with the famous statesman, and Chevening House is also associated with him by residence, for in the summer and autumn of 1769 the Earl of Chatham lived here for several months, and planned the new road through the park towards his own house at Hayes. It is still called Lord Chatham's Ride. Several letters from Lord Chatham and others written during his stay at Chevening are published in the "Archæologia Cantiana." In one addressed to Earl

CHEVENING HOUSE.



ST. BOTOLPH, CHEVENING.

Stanhope the great man says:—"The place is in high beauty," and adds an expression of the pleasure he felt in "retiring from scenes without to the noble feast of the mind within—your Lordship's admirable library."

A few words should be said about the Stanhope family, which has always held an honourable position, not only in the nobility, but in the paths of literature, arts and arms. Mention has been made of the first Earl, who was raised to the peerage for his distinguished services, being commander of the British forces in Spain, and gaining great renown by capturing Fort Mahon in the island of Minorca, 1708. The eldest son has been Lord Mahon ever since.

TOMB OF LADY FREDERICA STANHOPE.

CHEVENING HOUSE.

The first Earl was also Secretary of State, Chancellor of the Exchequer and Prime Minister. His grandson, third Earl, was renowned for his mechanical genius and scientific researches, and he married the daughter of William Pitt, Earl of Chatham. The fourth earl married into the Rosebery family, and was Keeper of the Records at the Tower of Dublin. The fifth was a famous historian, also Under-Secretary of State for Foreign Affairs, and the sixth, who died last year, not only did estimable service in Parliament, but was a captain in the Grenadier Guards, Lord-Lieutenant of Kent and President of the Kent Archæological Society. He also wrote several standard books of history. The present Earl is also an officer in the Grenadiers, and has been called, at the early age of twenty-six, to responsibilities which he will doubtless discharge with a credit worthy of himself and his noble ancestors.

The church of Chevening, dedicated to St. Botolph, is an ancient foundation, although the structure has been many times restored and altered to suit the fastidious tastes of the wealthy residents in this beautiful part of Kent. Its latest restoration was in 1858, when it was fitted with open seats, and a new south porch was built. The chief peculiarity of the church on plan is the abbreviation of the south aisle, which does not extend to the length of the nave westward, but only to the end of the chancel, its eastern part being devoted to the purposes of a mortuary chapel for the Stanhope family. It is doubtful if there has ever been a north aisle. It is true that the north windows seem to have been inserted in a closed arcade, but the arches do not correspond with central arcade, and there are no signs of columns. There are three Early English arches in the nave and two in the chancel, but no chancel arch. Most of the older windows are of the Perpendicular order, and a small Norman one remains north of the nave. The tower is rectilinear, and may be assigned roughly to the fifteenth century. It is embattled, and has an octagonal turret at the north-east, these frequent features of Kentish churches dating from the troublous times of the Plantagenet kings.

The church contains many monuments to the families who have been prominent in this part of Kent, the Stanhopes, the Dacres, the Lennards and others; but by far the most celebrated is the marble memorial by Chantrey of the beautiful Lady Frederica Louisa Stanhope, who died in childbed 1823. The figure of the young mother reclining with her baby at her breast is justly regarded as one of the noblest works of the great sculptor. The illustrations are from photographs by Mr. H. S. Mendelssohn, of Bayswater.

NOTES AND COMMENTS.

TIMES arise in towns when the amendment of the by-laws becomes a necessity which cannot be delayed. It is then difficult to expect consistency among those who submit plans or those who examine them. Concessions are occasionally made to meet particular cases and they are turned into precedents. Southampton at the present time appears to be in such a state. A builder was summoned for making party walls 9 inches thick, although the by-law stated party walls were to be 13 inches thick below the topmost storey. The defendant was erecting a terrace of ten houses, and although there were only five party walls he received ten summonses. It appeared that a few months ago the proposal by the builder to erect party walls 9 inches thick in other buildings was approved. Then the subject of amendment was considered by a committee who were equally divided, and no action was taken. Architects and surveyors gave evidence that the wall in question was a better wall than might be built under the by-laws, because it was stiffened by several cross walls. Apparently there was no certainty in the decisions of the committee, and a builder could not therefore calculate whether the examination would be rigorous or accommodating. The Bench, although they considered the wall equally as strong as if the regulation had been observed to the letter, recommended an amendment of the by-law, but inflicted a fine of 5*l.* and costs. The nine other summonses were then withdrawn without prejudice. A few similar cases would be sufficient to bring the whole system of by-laws into disrepute.

IT was anticipated that the works by the late PAUL BAUDRY in the Paris Opera House would have been as remarkable in their way as the building which CHARLES GARNIER designed. The painter devoted himself to the commissions with an ardour which, it is believed, was one of the causes of his premature death. PAUL BAUDRY was unable to anticipate all the effects of the immense quantity of gas which was to be used within the building, and in consequence his paintings have deteriorated to an extent that is lamentable. During the last few years it has been stated that efforts were to be taken to prevent further damage. But if any attempts were made they were found to be hopeless. It is now proposed to remove the paintings, and, although they are little more than wrecks, to deposit them in one of the museums. Exact copies will take their place. A commission has been appointed to arrange for the removal, if possible, with safety, and among the members are M. CASSIEN-BERNARD, the architect who has charge of the Opera House; M. PASCAL, and the painters MM. BONNAT, MAIGNAN and GUILLEMET; M. RODIN, the sculptor. M. AMBROISE BAUDRY will represent the artist's family.

ANOTHER gathering-ground in North Wales is likely to be secured by the Corporation of Birkenhead. The necessity for a new water supply does not appear to be very urgent, for Liverpool could afford to share its supply with Birkenhead on reasonable terms. The Corporation, however, preferred to ask Mr. G. F. DEACON, who was connected with the Liverpool Waterworks, to devise a scheme by which 6,000,000 gallons could be obtained daily, and which if desired could be further enlarged. The site, which at present is not particularised, was described in a report by one of the officials of the Geological Survey as "essentially a rural district without large rivers, without any mines or centres of trade, and even without villages or market towns of any importance in an area of about twenty-five miles in length." It is well adapted for the construction of reservoirs, assuming that more than one is needed. The scheme has been submitted to several specialists who have approved of it. The cost of supplying 5,000,000 gallons daily is put at 700,000*l.*, but the quantity could be doubled by an additional outlay of 350,000*l.* The engineering estimate of total cost is 1,050,000*l.* One reservoir is to have an area of 6,500 acres, but there can also be two additional reservoirs. The action on the part of the Birkenhead Corporation is a commentary on the hesitation of London to secure a basin which will be adequate to metropolitan requirements.

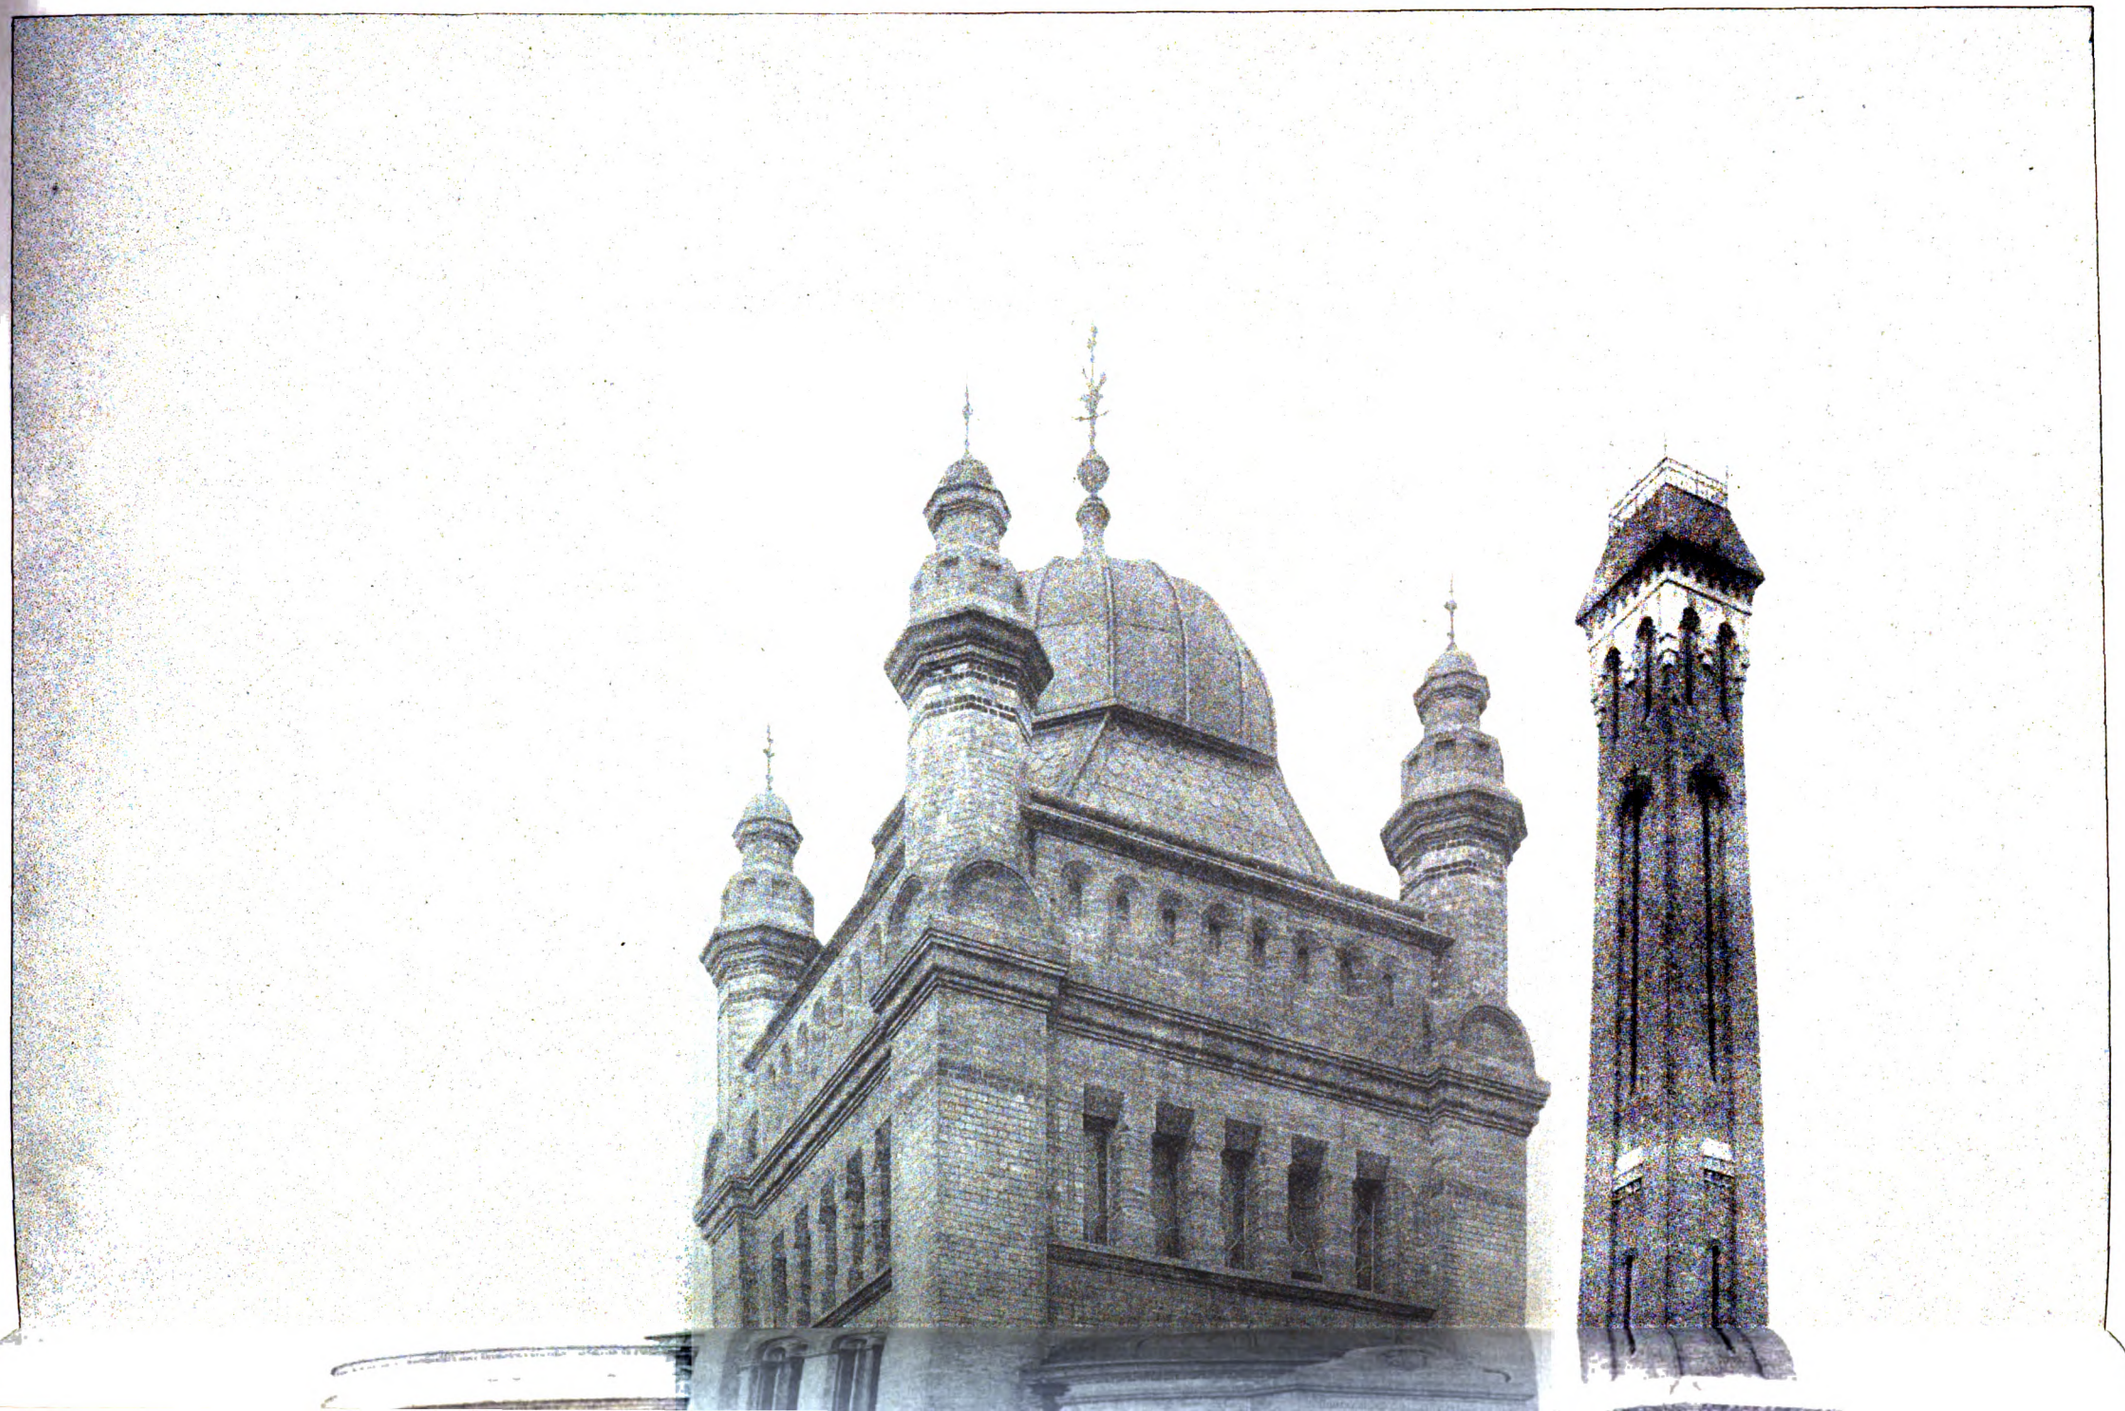
THE appearance of a picture by a Liverpool artist occasionally in the Royal Academy is not sufficient to convince amateurs about the existence of a school in that city. The exhibitions in Liverpool largely consist of paintings which come from studios in London, and they become more attractive than local works. It was therefore a happy thought to suggest that an historical exhibition of works by Liverpool painters should be arranged. For a century pictures have been produced with sufficient peculiarities to entitle them to be considered as forming a school, and we suppose there is little doubt that a collection of the works would give an impetus to local production. As the obtaining of works and their arrangement is an onerous task, it has been decided by the arts committee of the Corporation that the exhibition should be held in the earlier part of 1907 instead of in the present year. The Liverpool Academy of Arts will be invited to co-operate in the arrangements, which will be undertaken without delay.

ILLUSTRATIONS.

THE HOMAGE TO THE INFANT CHARLES V.

M. ALBERT DE VRIENDT was, like CHARLES V., a native of Ghent, and it was therefore a pleasure to him to depict scenes in the life of the great monarch who was once guilty of a pun by declaring that he could put all Paris in his *gant*. We have already published a plate after the painter's small but exquisite painting of the decorating of CHARLES V. with the insignia of the Order of the Golden Fleece, a work which received general admiration when it appeared in the Paris Salon. Although it is not generally known, the Emperor was likewise a Knight of the Garter, and came to Windsor in order to be installed. He lodged in Blackfriars, the palace at Bridewell having been assigned to his suite. On that occasion it was agreed that CHARLES was to marry the Princess MARY when she reached the age of twelve years. And not long afterwards he demanded her delivery to him. Subsequently a treaty of marriage was entered into between her and the great rival of CHARLES, FRANCIS I. That was broken off, and after negotiations with others she became the wife of the son of CHARLES V. The Emperor was no friend to the Netherlands, nor, indeed, to any country in Europe that desired freedom. He has been made, however, the subject of many paintings, and if ALBERT DE VRIENDT had lived longer, he would have been inspired by other incidents in the Emperor's life.

MASONIC INSTITUTION FOR BOYS, BUSHEY, HERTS.—TOP OF TOWER—ENTRANCE HALL.



STREATHAM COMMON PUMPING STATION.

THIS was erected from the design and under the superintendence of Mr. J. W. RESTLER, M.I.C.E., formerly engineer to the Southwark and Vauxhall Water Company, and now the deputy chief engineer of the Metropolitan Water Board. The contractors were Messrs. HOLLOWAY BROS. Ham Hill stone dressings were largely used and Burham bricks for facings, with Suffolk bricks for arches. All white glazed bricks were employed in the pumping chambers, and a good deal of terra-cotta work both inside and outside by Messrs. DOULTON. The circular engine-house is unique, and the boring was one of the deepest in the kingdom for this kind of waterworks. It went down to a depth of 1,271 feet into the older rocks, but the lower green sand was missing.

EVOLUTION OF LONDON COUNTY SCHOOLS.*

(Concluded from last week.)

WE submit a statement showing for the last seven years the number of new schools for which tenders were accepted, together with the accommodation, the total amount of the tenders and the total average cost a place :—

Year ended December 31.	Number of new Schools for which Tenders were Accepted.	Accommodation of Schools.	Total Amount of Tenders.	Average Cost per Place of Main Building Complete and Ready for Occupation (excluding Offices, Works on Site, Furniture.	Average Total Cost per Place (excluding Furniture, Supervision, &c.).
			£ s. d.	£ s. d.	£ s. d.
1899	11	9,113	256,580 5 6	17 16 11	24 7 2
1900	10	9,032	257,477 0 0	20 3 4	27 7 6
1901	6	5,188	121,828 0 0	20 1 0	28 17 1
1902	8	6,970	164,653 0 0	17 6 3	23 12 5
1903	18	16,521	367,829 10 0	15 11 3	22 3 6
1904	6	5,932	125,184 0 0	16 4 7	21 19 11
1905	3	2,820	61,300 0 0	16 9 11	22 4 5

We also append particulars relating to the cost of nine typical schools, the tenders for which were amongst the last accepted by the late authority, and in comparing the cost per place in the foregoing and in the following table with the cost per place in the Croydon and the Willesden schools, it it is very important to notice that the average accommodation in the London schools is much lower than that in schools under the Croydon and the Willesden authorities :—

County Electoral Area and Name of School.	Accommodation.	Date of Acceptance of Tender by late Authority.	Amount of Tender.	Area of Site.	Cost per Place (Main School Buildings only).	Total Cost per Place (including Centres, but excluding Furniture, &c.).

The average number of children accommodated in each of these schools is 1,027, the average cost a place of main school buildings only is 15*l.* 9*s.* 2*d.*, and the average total cost per place calculated on the total amount of tenders is 21*l.* 18*s.* 5*d.*

It should be noted that in none of the cases referred to in the above statement did the cost exceed the amount of the loan allowed by the Board of Education on the capital cost. This is the more noteworthy in that the loan for the main building was still only 10*l.* per child, with certain special allowances which were added from time to time.

When the question of reducing the cost of buildings to be erected for a certain purpose and of an accepted type is under consideration, there are only two ways in which it can be effected—(i.) by reducing the requirements or being content with a smaller or simpler building, and (ii.) by lowering the standard of the building. With regard to (i.) the required accommodation has to be provided in class-rooms, graduated in size according to the numbers for which the school has to be built. These classrooms have to satisfy the code with regard to the number of superficial feet for each child, and the heights are also stipulated for; proper entrances and exits, cloak-rooms containing a peg for each child, adequate lavatories, stock-rooms, teachers' rooms and offices have to be provided according to a scale laid down in the code, and, as each classroom has to be approached separately, it is evident that corridors or halls have to be provided for the purpose. If the school is planned with proper regard to its use for teaching purposes, the central-hall plan is the best and most economical, by reason of the fact that, if properly arranged, the hall supplies the place of corridors, and, as the head teacher's desk is placed therein, proper supervision of the whole department is secured. The value of the central hall for school work has been so thoroughly appreciated that it has been decided to spend a yearly sum in providing these and other modern adjuncts to the schools built in the earlier years of the late authority and not provided with them.

As regards the provision of rooms for special purposes such as art, science, manual and domestic work, it would appear that an art or drawing classroom is not now considered a necessary adjunct to every elementary school, but that a room for general science is desirable. As regards manual training-rooms, it is a question whether such rooms should be built for forty or twenty boys, or should be in the nature of centres for groups of schools or adjuncts to each school. As regards housewifery centres, we cannot consider an ordinary domestic house suitable therefor, and certainly their construction is never such as to fulfil the requirements of the Building Acts for a public building, which they undoubtedly become as soon as they are used for teaching purposes.

With regard to (ii.) when the alternative tenders, which are about to be obtained for three new schools sanctioned by the Council, are received, there will be an opportunity of ascertaining what the savings under the various heads of the revised specification will amount to. The principal suggestion is for building the brickwork in lime mortar instead of cement. Whatever the saving may show under this head, the late authority and the Council has had experience of the cost and inconvenience involved in re-pointing buildings, inevitable after a certain time when built with lime mortar; the cost in the case of a school of the ordinary size and type is about 350*l.*, with the nuisance from the dust caused by the raking out of the joints and the erection of scaffolding and the presence of workmen on the premises during school hours, and the consequent risk of accidents. Again, piers carrying girders and heavy weights must be built of a larger size if not in cement; so that, taking all these matters into consideration, we cannot consider the saving on the initial cost desirable, especially considering that the after expenses would fall on the rates of the year.

For a proper comparison to be made of the cost "per place," the cost should be based, not on total cost, including the site, but on the main buildings complete and ready for occupation. The site difficulty affects the total cost so much that the whole calculation is vitiated by having to deal with such sites as Plum Lane (Woolwich), Invicta Road (Greenwich), New End (Hampstead), and others, whereas level rectangular sites like Townmead Road (Fulham) and similar ones present no unusual or costly difficulties. Further, taking the maximum size of a department as for, say, 300 children, and building originally for, perhaps, 200, the hall is built of the requisite size for the full number to be accommodated in the completed school. Generally the cloak-rooms, teachers' rooms, lavatories, &c., are also built complete, and this provision for future requirements, while it adds to the initial cost, is really a considerable saving to the Council, as when the additional classrooms are erected the further cost is about 7*l.* 10*s.* per place.

The true test of the cost of a building is its cost per foot cube on the main building, and we venture to assert that no buildings of a public character have been built in the manner in which schools have been erected at a smaller comparative cost. The architectural features of an expensive nature have been reduced to a minimum, and effect obtained by carefully studied proportions and grouping. By way of

* From the Report of the Education Committee.

illustration, three types of schools built within the last three years are given below :—

Electoral Area and Name of School.	Storey.	Accommodation.	Cost per foot cube (main buildings complete and ready for occupation).
			d.
WANDSWORTH. Broadwater Road .	3 storeys	920	7.90
FULHAM. New King's Road .	Ditto	1,148	8.31
DULWICH. Denmark Hill . .	2 storeys (graded departments), 1 storey (infants)	996	7.83
WANDSWORTH. Wandle, The . .	Ditto	1,140	8.85
Southfields . .	1 storey buildings . .	1,126	6.70
FULHAM. Townmead Road .	Ditto	1,124	7.14

We feel confident that, upon a comparison being made between school buildings and buildings erected by the Council for other purposes, the result will be favourable to the schools.

With regard to the planning of the schools and their fitness for teaching purposes, it may be stated that the architect to the Board of Education has published, with permission, plans of some of the modern schools of the Council as types of what such buildings should be. In this connection we think it would be of interest to the Council to have before it when considering this report a sheet of diagrams (which will be laid upon the table) showing various types of schools of which we present the subjoined explanations :—

A and B represent elevation and plan of the Trundley's Road school (Deptford), a building designed with an effort to reduce cost by erecting a school without any architectural features—simply of plain stock bricks, slate roofs and without architectural embellishments of any kind; at the same time obtaining the standard of building and the completeness of plan by which a satisfactory school building, apart from its external appearance, is secured.

C and D represent the elevation and plan of a type of school in which the architectural adornment was carried beyond the general standard of the late authority, the walls being faced with red brick and terra-cotta being introduced to a considerable extent.

E and F is a type of school similar in plan to D, and designed in a similar manner, the walls being faced with stock bricks with red arches and dressings to the windows, terra-cotta being introduced sparingly and the roofs covered with red tiles. The cost of a school of this design as compared with A works out at about an additional 5 per cent. on account of the architectural features, and is a type which was reverted to by the late authority in preference to the bare and barrack-like appearance of A.

G is a plan of a school which was worked out to embrace the minimum of the requirements of the Board of Education for a school of that number. It has been a type adopted with more or less unimportant modifications at Stillness Road (Lewisham), Southfields (Wandsworth), Deansfield Road (Woolwich), Timbercroft Road (Woolwich) and other sites where the area was sufficiently large to admit of the erection of one-storey buildings. This is a plan which the architect to the Board of Education has illustrated as the type of an ideal school, and it will be observed that corridors giving access to the classrooms are eliminated altogether, the central hall answering the purpose, giving complete control and supervision over every classroom. It is also a type which is mentioned as costing 6.70*d.* per foot cube, being in our opinion about the cheapest type of school which can be erected.

Conclusions.

There are so many special features to be taken into consideration in regard to the area, the shape and adaptability of each site and the situation of the school thereon, the accommodation required for each department, and the need for future enlargement, that it is not possible to estimate closely the cost which will be incurred in respect of any school proposed to be erected until the plans have been prepared and the quantities taken out. There is no doubt that in many cases the elevation of the school and the architectural features in connection therewith have not been designed with so strict a regard to economy as to the pleasing and dignified appearance which has enabled a school to adorn the neighbourhood in which it has been placed. In this connection the Oliver Goldsmith school, Peckham Road, may be cited as a case where the late authority indulged more freely in ornament, because the Camberwell Metropolitan Borough Council appealed to the Board to put up a building in harmony with the importance of the thoroughfare.

As regards the sanitary fittings and arrangements in connection therewith, there appears to be a general impression that these could be of a considerably less costly description, approximating more closely to one of the standards in use in the erection of dwellings for the working classes. We venture to point out that this impression is hardly borne out by facts, and that such a standard would scarcely suffice in view of the rough usage to which the school fittings are liable to be subjected. Further, the comparison hardly applies, inasmuch as in the case of the dwellings one closet only is required to each, and the number of closets in the lodging-houses is small as compared with the liberal supply in the schools (provided in blocks and required by the code of the Board of Education). When it is remembered that the total number of separate closets amounts to about 6,000 or 7,000, the importance of having a substantial and durable type of fitting, pan, &c., in the first instance provided out of loan will be readily appreciated, especially when it is recollected that the cost of all subsequent repairs—thus reduced to a minimum—comes out of the rates of the year. The use of iron drains will be abandoned except where the drains pass through made-up ground or under buildings.

As regards wood-block flooring, we propose to effect a saving under this head by substituting in the classrooms flooring on fillets on the concrete, thus limiting the use of wood-block flooring to the halls and corridors only. It is also proposed to reduce somewhat the cost of the glazed bricks by providing these dado high only in the corridors with plastered walls above.

The playsheds will without material disadvantage be simplified in construction and reduced in cost by the use of iron columns.

The standard pattern of sashes and fittings, together with substitution of cords, pulleys and quadrant stays for the present metal window gearing, will be provided for.

We do not advise that the specification should be altered in regard to the requirements for "picked" stocks, the saving in cost being so trivial. This remark applies also to the cisterns in view of the material sanitary advantages gained, as compared with the use of ordinary cisterns in lead or galvanised iron, to say nothing of the saving in labour in cleaning.

The instruction to obtain from warming engineers competitive schemes for providing systems of warming by low-pressure hot-water apparatus is already being followed in the case of the new schools in course of erection on the sites in Senrab Street (Stepney) and Sellincourt Road (Wandsworth). It will then be possible to obtain a comparison in cost with the present systems, and should a saving result, the usual provision now included for warming can be reduced. We propose to look carefully into this question and to submit a further report thereon at a later date.

We have instructed the architect (education) in all future cases to lay before us a report showing the estimated cost of all portions of the proposed buildings above the floors actually occupied for ordinary teaching purposes. We also propose to consider carefully in each case whether expenditure can be reduced by the omission of rooms for art classes, and ordinary drawing classrooms in the roof. By the omission of this storey there will be a saving of as much as possibly 800*l.* or 900*l.* in the cost of a school, while by making reductions in the cost of carving and general architectural embellishments in all suitable cases, by excluding as far as practicable from the specifications the use of special patented articles, and by making the other reductions already alluded to, we hope to effect a further saving. It must, however be borne in mind that while the provision of a roof playground adds very materially to the cost of the school, it is only arranged in those cases where the site is small and the cost of additional land is prohibitive, and to that extent the extra cost of building is the result of a saving in the expenditure on the site.

We have also decided to throw the tenders open to public competition more frequently; though there are manifest advantages in confining the competition to a large selected list of contractors who are acquainted with the special requirements of this class of work.

We think that the experience gained on many points while engaged in this investigation will result in a decrease in the future cost of erection of public elementary schools

Digitized by Google

without detriment to the necessarily high standard of quality and efficiency which the Council should maintain. We have had submitted to us plans of a typical school for 1,176 children, consisting of three one-storey buildings to be erected on a perfectly level and large site to be selected, requiring no retaining walls or terracing nor extra deep foundations, the boundaries being of oak fencing instead of a brick wall, and the specification providing for the reductions already agreed to by the Council and the further modifications suggested in this report. The cost of a school of this design is estimated as follows :—

Main school buildings complete 13,664*l.*, equivalent to 11*l.* 12*s.* 4*d.* a place.

Main school buildings, including enclosing and draining site, &c., 17,834*l.*

Total cost, including possible extras, lithography, furniture, supervision charges, &c., 19,659*l.*, equivalent to 16*l.* 14*s.* 4*d.* a place.

The cost per foot cube is 6½*d.*

We desire, in conclusion, strongly to represent to the Council that it is a very extravagant proceeding to plan schools for subsequent enlargement in growing neighbourhoods, instead of building the complete school at once, where it is known that the full accommodation will be required in a short time, but we have up to the present been unable in these cases to obtain the sanction of the Board of Education to build slightly in advance of actual immediate requirements.

THE QUANTITY SURVEYORS' ASSOCIATION.

THE annual general meeting of this Association was held on Wednesday, May 30, at the Holborn Restaurant, the president (Mr. Walter Lawrance, F.S.I.) in the chair.

The minutes of the previous meeting were duly read and confirmed, and the result of the election for members of Council for the ensuing year declared, showing the following elected as London members :—Messrs. A. J. Gate, F.S.I., A. G. Cross, F.S.I., W. R. Hood, F.S.I., H. England, R. L. Curtis, jun., H. W. Crickmay, W. W. Barber and S. Chatfeild Clarke, F.S.I.; as provincial members, Messrs. H. Curtis-Card, F.S.I., R. J. Tollit, Arnold Harris, F.S.I., and W. Hoffman Wood.

The President, reviewing the work done by the Council during the past year, congratulated the Association upon the steady increase of membership, the total number on the roll being 155 members and four students, and also upon its eminently satisfactory financial position. Out of 15 candidates who entered for the examinations, which by the courtesy of the Governors were held this year at King's College, the following passed the direct final examination :—Messrs. G. Sylvester Taylor, E. G. Huggins, W. G. Walder, L. C. Veale, A. Stratton and F. M. Gilbert; while in the preliminary examination qualifying for admission as students the following satisfied the examiners :—Messrs. D. A. Roberts, E. T. Parr and Donald Hewitt. An examination was held simultaneously in Pretoria, the results of which had not yet been received. A rather important departure had been made in the professional examination this year by the elimination of papers on abstracting and billing, an additional day being devoted to the subject of "taking off" After alluding to the useful work done by the committee on professional practice, which had dealt with a considerable number of questions raised by members, and to the formation of the Belfast Quantity Surveyors' Society, of which body the original members are also members of this Association, the President stated that in order to redeem the promise made to the members a year ago the Council had recently issued a scale of fees which, however, is intended to apply to works undertaken for public bodies only. This scale of fees has been sent to upwards of 1,800 public authorities in England and Wales, and from the numerous replies and letters on the subject the Council has received, it is hoped that it will be generally adopted, and so to a great extent that undesirable practice of a public body inviting men to tender for the supply of their professional services will cease, although the Council admits that its failure to secure the co-operation of the Surveyors' Institution towards mitigating this evil is a matter for regret. The President next referred to the "Standardisation of Quantities," saying that this question had been under consideration by the Council practically since the formation of the Association, and had been fully discussed after a paper on the subject had been read by Mr. A. G. Cross. Subsequently a paper by the late Mr. John Leaning was read at the Surveyors' Institution, and letters on the same subject had appeared in the professional papers. The Council recognises that, except with the co-operation of the other bodies interested, it is impossible to move in the matter, and has therefore approached some of the leading institutions or societies to whom this question should appeal with a view to the holding a conference on the subject. Pending the receipt of definite replies the matter must remain in abeyance. An expression of his own personal regret and the regret of the Council generally at the resignation of Mr. F. B. Hollis, the late honorary secretary and treasurer, and an expression of his thanks to the members and to the Council for their courtesy during the two years in which he has occupied the chair, brought the President's speech to a conclusion.

Mr. H. T. A. Chidgey, in moving the adoption of the Council's report and balance sheet, congratulated the Council upon its year of office and the work accomplished. He associated himself with the President in his expression of regret at Mr. F. B. Hollis's resignation, and referred to the great service Mr. Hollis had rendered to the Association from its conception. Although very glad that the Council had issued a scale of fees intended to be used by public bodies, the Council was in his opinion very wise in not publishing one which would apply to private work.

Mr. W. R. Hood, F.S.I., who seconded the motion, hoped that the Council's report would be criticised by the members present, as the Council would then feel that live interest is being given to the Association.

Mr. C. W. Ball (Southsea) expressed the fear that the Council's action in issuing the scale of fees broadcast among public bodies would prove to be inimical to the interests of some of the members. His work lay almost exclusively among public bodies, and the fees he received were very considerably in excess of those laid down in the scale.

The President, in reply, stated that if Mr. Ball practised in London he would very soon learn that the majority of London authorities pay ridiculously inadequate fees to their quantity surveyors, and instanced a recent experience of his in which he was asked to quote for preparing the quantities for some building for a London Borough Council. The building was to cost 3,000*l.*, the quantity surveyor was expected to correct the specification, and his charge was to include the supply of fifty copies of the bills. The lowest tenderer (happily not a member of this Association) was appointed to do the work at an inclusive fee of 28*l.*

Mr. R. J. Tollit, as a provincial member of Council, wished to assure Mr. Ball that the interests of the provincial members were not neglected by the Council. He personally heartily agreed with Mr. Ball in his statement that the scale of fees which had been issued was a very low one, and that, as the outcome of its publication, some of the provincial members would suffer, and for this reason he had opposed its issue. From some of the statements made by members of Council while the matter was under discussion, and also from the President's remarks that afternoon, he had arrived at the conclusion that London quantity surveyors accepted very small fees indeed.

Mr. T. Woodbridge Biggs, who supported the motion for the adoption of the report, expressed his regret that he had reached the meeting too late to hear all the President's speech. He stated, as his opinion, that if the newly-issued scale of fees was thoroughly established as a recognised scale in London (which will be a very difficult matter to achieve), and the provincial surveyors can support it and get similar fees for themselves, the provincial members would be in an infinitely better position than the London members, as the cost of preparing the work (always done at high pressure in London) is lower in the provinces.

The motion was then carried unanimously.

A vote of thanks to the auditors, Messrs. E. D. Nixon and H. J. West, F.S.I., was then passed on the motion of Mr. W. R. Hood, F.S.I., seconded by Mr. C. A. Kennett, P.A.S.I.

Mr. England moved a vote of thanks to the scrutineers, which was seconded by Mr. E. A. Wylie and carried unanimously, to which Mr. C. A. Kennett suitably replied.

Mr. A. J. Gate, F.S.I. (vice-president), in proposing a hearty vote of thanks to the President, referred to the arduous duties Mr. Lawrance had performed on behalf of the Association during the last two years, and to the difficulties and the opposition with which the Association had to contend at the outset of its career. But for the tact and skill the President had displayed the Association would not have been carried through some of its earlier troubles.

Digitized by Google

Mr. A. G. Cross, F.S.I. (hon. sec.), in seconding the vote of thanks, remarked that future generations of quantity surveyors would recognise what a debt of gratitude they owed to Mr. Lawrance, the first president of the Association, the existence of which Association was, in his opinion, essential (he felt almost justified in saying) to the continued existence of the quantity surveyor.

The President, in replying, thanked all those with whom he had been associated during the time he had had the honour of being President, and hoped that the members would adhere to the scale of fees the Association had issued, whatever self-sacrifice that course might entail.

The meeting then terminated.

A Council meeting was subsequently held at which, we learn, Mr. A. J. Gate, F.S.I., was elected president, and Mr. H. Curtis-Card, F.S.I., and Mr. W. R. Hood, F.S.I., vice-presidents, for the ensuing year. Mr. H. T. A. Chidgey was elected to the vacant seat on the Council caused by the resignation of Mr. A. G. Cross, F.S.I., who was elected hon. secretary.

AN EGYPTIAN CAMP.

IT is announced in the *Times* that at Tell el Yehudiyeh Professor Flinders Petrie has excavated an enormous earthwork camp. This camp was constructed before 1500 B.C. by a nomadic people, who were entirely ignorant of construction in stone, brick or even wood, and who trusted entirely to archery for their defence. They had no pottery in common use, and therefore used vessels of leather and of wood. As many graves of the Hyksos age were found, the earlier inside the camp, the later in a cemetery outside, and as the whole region has produced more scarabs of the Hyksos than of all the other ages of Egypt, it is obvious that the nomads who formed this camp were of this mysterious race.

The camp is a great earthen enclosure, quadrilateral, with rounded corners, much like many earth camps in other countries. It is about 1,500 feet across, with a bank about 200 feet thick at the base. This bank was faced outside with a slope of white stucco 70 feet or 80 feet long, at an angle of 35 to 45 deg. But the makers knew nothing of a gateway; the use of brick or wood did not enter into their scheme of defence, and their way of entering the camp was to make a sloping road about 200 feet long, rising up over the great bank of the camp. Flanking walls were thrown out on each side of the sloping entrance to enable archers to rake the road sideways at close quarters. We have here evidently a people in the well-known stage of culture of Central Asian nomads; great archers like the Scythians, Persians, Parthians or Turcomans, but depending entirely on earthwork for defence. After two or three generations in Egypt the system of fighting was entirely remodelled. The advantage of the walled forts of the Egyptians was recognised, and an immense stone wall over 40 feet high, 6 feet thick and a mile in length was built around the earthwork, and earth filled in between that and the sloping face. But yet the old sloping entrance road was kept, and gateways in the wall were not accepted. Every point that we learn agrees exactly with the account of Manetho, when he states that the Hyksos were barbarians who within a hundred years organised a firm government and built a great walled camp. It is probable that this camp now before us is indeed the celebrated city of Avaris, but the details of the identification cannot be entered on here.

AN AMERICAN HOTEL ARCHITECT.

A CONVERSATION with Mr. Henry Janeway Hardenbergh is related by Mr. Sadakichi Hartmann in the *Architectural Record* of New York for this month, from which we take the following:—

We at once settled down to serious business, to an interview, one of those old-fashioned, matter-of-fact interviews that have really taken place and are in no way masked with inadequate ornamentation.

"I believe you studied with one of the old New York architects, Detlef Lienau by name?" was my first turn of the key.

"Yes, he was a remarkable man for his time," and Mr. Hardenbergh's face was lit up for a moment as with pleasant recollection. "Of course, building—I entered Lienau's office in '63—had not yet reached such dimensions in New York as it did in the following decades. But he did good, solid work, notably in the French Renaissance. I do not remember at this moment all he did. One of the best specimens is that old residential dwelling, Tenth Street and Fifth Avenue."

"You never studied abroad?"

"No, I never got to Europe until after quite a number of years of active practice."

"Then your case seems to prove that a man can become an architect without studying abroad?"

"Emphatically, yes," he exclaimed with peculiar emphasis, that did not solely betray conviction, but also pride in what he himself had accomplished. "It only depends on how one studies. For that matter, one could live at the seashore and become a good architect. Of course, there were drawbacks; books and photographs were scarce at that time. The facilities for reproductions were still slight. I remember how delighted I was when I got my first collection of Parisian buildings; I thought it a rare treasure."

"But are you not of the opinion that there are too many publications nowadays?"

"Decidedly so. The young men rely too much on their assistance. They go from one book to the other, and get a little bit here and a little bit there, but do not understand how to put them together."

"I suppose you served a real German apprenticeship at Lienau's?"

"Yes, it was a true apprenticeship. Conditions were different. He had never more than six men in his office. He could really devote some time to them. Now many offices have forty to fifty men on their pay-roll."

"I know of one firm which several years ago had as many as ninety-three draughtsmen in their employ. This, I suppose, makes personal instruction impossible in these days?" I interpolated.

"Absolutely! I have not more than ten minutes a day to give to the younger men; but they learn from the older draughtsmen," he said, after some reflection. "Yet without arrogance, only with due respect to my way of doing things, I can say that I have done my work with a smaller clerical force than most offices. If you have too large a force, you have to depend too much on other men. You lose touch with your own work. The individuality of one's style is apt to suffer thereby."

"You are particularly interested in municipal art?"

"Yes, I was one of the founders of the Municipal Art Society."

"And if I am not mistaken, you individually have also helped matters along on that line?"

"Yes, I have always regarded mural decoration a part of architecture, and always tried to persuade my clients that there was a necessity for such a thing. At the Waldorf-Astoria we simply gave out the work. I had made up my mind to have Blashfield, and insisted until I got him. At the Manhattan, in order to avoid what might look like favouritism, I managed to arrange a competition with a thousand dollars in prizes. Five artists competed."

"How did the painters adapt themselves to the work?"

"Of course, it was a new experiment with them. They all 'paint' a trifle too much. They do not seem to be able to adapt themselves to their environment, to any particular style. There are hardly any of them who understand ornament. Simmons seems to get nearer to the real thing than any of them. And even he is still too much of an easel-painter. Look, for instance, at this little panel," and he pointed to a canvas by Shean over the mantelpiece, representing *The Architect and his Client* in Mediæval costume and surroundings. "It is very nice, well painted, but hardly mural in feeling."

"You seem to have made a specialty of hotels?" I asked, remembering that we owe to this architect the popular structures of the Waldorf-Astoria, the Manhattan, the Dakota and others.

"Yes, it seems to have been my fatality that things have come that way. I have built a large number of them. But I have also done a good deal in apartment houses, and lately in office buildings. To show you how eclectic an architect really has to be:—One of my first commissions was a Gothic chapel for Rutger's College in New Brunswick, my native town. Soon after came a row of Ohio limestone dwellings. About the same time I constructed a Turkish bath in the private house of a gentleman. It was done all in the Pompeian style. I had the entrée to the Neo-Grec through Lienau. Lienau was a pupil of Labrouste, the architect of the Ste Geneviève library in Paris, and the

Digitized by Google

hospital at Lausanne, who effected a successful combination of the modern French and Neo-Grec. You will notice in all the works of the French architect a certain simplicity and severity of detail."

Labrouste was one of the first who succeeded in the employment of modern building materials thoroughly in accordance with beautiful form and original ideas. Through Lienau his skill and cultivated taste has descended upon Hardenbergh, who thereby was prepared to avoid the reefs on which so many of our modern architects have suffered shipwreck. My remarks gave Mr. Hardenbergh an opportunity to express his views on the modern French.

"I have always been charged, though unjustly, of being opposed to the modern French. This objection applies only to later work in the style. They can't go much further. It is all for sensational effect and will end in sheer brutality. Their ornaments," and he made a descriptive gesture, "are crude and clumsy. There would be no objection if they would stick to the fine examples of the past, but this way——"

"Do you think the New York architects set the taste for the whole country?"

"I think so. When Richardson had built his Trinity Church you saw bad Richardsons cropping up all over the country. For instance, in Chicago it was simply awful. Of course, we all do incongruous things in our time. They lately tore down a building of mine, of which I felt very proud at the time it was built; but I was really delighted when it was gone."

"Do you think we will arrive at more uniformity of style?"

"Possibly," he remarked, rather drily. "Conditions and needs will bring it about. But elements of new formations must necessarily be based on reminiscences of those already existing."

"And at present these reminiscences seem to be all modern French," I insinuated.

"Not entirely; the Classic movement is very strong. Nearly everything that some of our leading architects build of late has the characteristic columns and the tympanum on top. I myself am very fond of the German Renaissance. Not when it was loud, overloaded with ornaments, but modified. I also have a liking for the Dutch Renaissance," and he showed me a sketch of the New York Club. In its elegant simplicity it reminded me slightly of the building of the Fine Arts Society, which I consider one of Hardenbergh's masterpieces.

"Yes, that was really a work of love," he explained. "If it only could have been placed differently. The apartment house next to it spoils much of the effect. The model for it was a François I. in the Cour de la Reine, Paris. I only saw it two years ago, long after the New York building was finished. I had been in Paris before, but had missed it. And when I at last made it my object to see it, I was highly delighted."

"How is it with more utilitarian buildings? Do not the difficulties of the internal arrangement take so much thought and time that there is comparatively little left for the consideration of the art element?"

"Not in the least," he said most decisively. "You see, the laying out of the plans of lighting, heating, &c., one has after all to leave largely to the engineers. No man can do that all by himself."

"You try to make the interior correspond as much as possible with the outside; it seems to me that the latter is often merely a shell."

"Yes, that is a fault that I find with many buildings. But I always try to bring everything into a certain harmony. Of course, in a hotel all tastes have to be satisfied, and one must know pretty well how the space is going to be utilised before one can realise the artistic vision of the outward appearance of a building. The architect has to deal with three factors, all of equal importance—first, the artistic element; second, construction; and third, interior decoration. It is just as in music, a certain *Leitmotif* should run through everything. Otherwise it would be merely a collection of miscellaneous details, as you have correctly said, a husk, a shell. The trouble is, that we are always in such a hurry in this country. At times this may prove a stimulant. One simply has to go, work and do it. But if it comes to details of ornamentation or interior decoration it is deplorable. The outside of a building should always indicate what is inside. Look, for instance, at those big windows over there," and he pointed at the Waldorf-Astoria as an object lesson. "You feel that there is a big assembly hall behind them, and so it is with everything. The windows of the various parlours are still large in comparison with those of the ordinary rooms, but much smaller than those of the ball-room."

This emphasised a trite architectural truth, that the outside forms must be characteristic of the aim and object of the interiors, which they hide from view.

"How do you think our architecture compares with the European? Do you think we have as much claim to originality?"

"I am certain of it. And that is said without any conceit or partiality. In England they are not handicapped by space, as we are here, and they have quite a number of beautiful buildings to their credit; but they are not more frequent than on this side. L'Art Nouveau in France was a failure. The rest is entirely under the influence of the modern French. In Italy they live largely on Classic traditions."

"Have you been at Cologne? There they seem to have produced a great variety of forms."

"Yes, but that is Belgian influence. The Dutch Renaissance is very adequate."

"It always seemed to me that the new Court House in Brussels is a very fine specimen of modern architecture."

"Very impressive. The combination of Assyrian and Classic styles shows very much ingenuity, but one can hardly call it good architecture. No, I think we are fully awake over here. And in the specialty of residential houses, of office buildings and hotels, I think we have accomplished what nobody else has done. We have adapted ourselves to new conditions, both æsthetically and in accordance with style."

"Have you any special method in following out your theories?"

"My method is really a very simple one. There, for instance, is a sketch of the new Plaza Hotel," and he showed me a sketch of that giant caravansary. There seems to be a striking tendency in this latest of his work to abandon the picturesqueness and irregularity of his former style, and to arrive at a simpler and at the same time more pleasing effect. I had involuntarily to smile, however, at what seemed to me interminable rows of windows. He guessed my thought. "None of them is unnecessary. Now, what would be the use of introducing columns, colonnades, as they do? The Greek didn't build buildings of this kind. Edifices of this order have been unknown to past generations. They have no prototypes. All one can do is to take some good model, that served some kind of purpose as a hotel, and enlarge upon it, and then embellish it as well as one can, as, for instance, in this case, with the early French Renaissance."

BUILDINGS IN GARDEN CITIES.

IN the *Journal of the Sanitary Institute* for June is an address by Mr. H. D. Searles-Wood, which is a comment on Dr. B. W. Richardson's description of a city of health.

Taking the question of height of buildings, says Mr. Searles-Wood, I was struck the other day looking at some photographs of Winnipeg, one of the latest developed cities in Canada, to see that they were building houses of twelve and fifteen storeys, and when I was told later that land in the centre of the city was sold at the highest price per foot ever given for land, it seemed all the more strange. Apparently there is no physical reason, like the island site of New York, to account for the larger buildings. Winnipeg is situated on a plain that affords boundless means of expansion.

The modern experience of manufacturers, however, is in favour of even one-storey factories when the price of the land is not prohibitive, and I know of some factories which cover an acre of space all under one roof. The advantage of this, from a manufacturer's point of view, is ease of supervision. The question of adequate means of escape in case of fire and the proper ventilation and heating of such big cubic contents raise novel points, but should not be difficult of solution. The system of construction is a series of ridge and furrow roofs, carried on iron supports.

The question of limit of area to buildings of this class is being rapidly brought to the front in the sheds which are required for storing and attending to the motor-buses that are being erected in the outskirts of large towns, the Building Act limit of 250,000 cubic feet being much too small.

The method of raising all buildings on arches above the

Digitized by Google

ground has been practised for hospital buildings, but has not been used for private dwellings owing to the cost; it has much to recommend it, only the space underneath the house must be sufficiently high to make it get-at-able and so kept clear of rubbish, and until the people are educated up to the appreciation of absolute freedom of air circulation around their houses the space would be sure to be the store-house of all kinds of rubbish.

The perforated bricks described by Dr. Richardson have been used, but have not taken hold on the public. One of the objections to them is the way they behave in cases of fire, the face of the brick flying off when the brick is heated and water is turned on. With regard to the case of glazed bricks for the internal surface of walls and ceilings, I think experience has shown that a glazed surface such as those present does not make a comfortable room to occupy, and the usual method at present adopted is to confine the glazed work to a dado about 4 feet high, and above that to use plaster and some kind of paint or distemper.

The use of concrete blocks made with air-spaces inside is being advocated and it forms a cheap and useful method of building; one of the best of the 150*l.* cottages built at Letchworth was built of this material. Reinforced concrete, that is, concrete in which steel bars are introduced, in position to take up the strains, is making rapid progress, and some notable buildings have recently been erected in this way, the advantages being that the constructive work is practically homogeneous and the steel is adequately protected in the case of fire. But it must be borne in mind that the element of weight in our solidly-built brick structures is not entirely useless, and if the slighter methods of construction which reinforced concrete allows be employed, the question of wind-pressure has to be taken into account and the building adequately braced to counteract it.

The method of treating the smoke by connecting all the flues with central shafts where the smoke is driven through a gas furnace, the free carbon is destroyed, and the products of combustion discharged colourless into the open air has not yet been tried, but at the recent Smoke Abatement Exhibition a patent was shown which did this in the individual flue; in the 4-inch iron smoke shaft a combustion chamber was inserted, the smoke passed through and the whole of the free carbon destroyed.

The flat roofs advocated have been tried, and not always with success. The usual method is to cover the space with concrete and lay the asphalte on the top, but care must be taken to prevent the expansion of the concrete pushing the walls out; I knew of this being the case in a building erected by the London School Board in the South of London; the flat roof of the building expanded and pushed the walls out of place. Another objection is that if no false ceiling s made to the rooms under, the moisture in the air is apt io condense on the ceiling.

c There is a new method of roofing by means of a material alled ruberoid, which is a preparation of indiarubber laid in two or three thicknesses and covered with gravel; when sk ilfully laid this makes a cheap and durable roofing material, but I have not heard how it behaves in case of fire.

The suggestion of placing the kitchen at the top of the house has been tried, but has not met with public approval, and I think that there are obvious drawbacks.

The hospital with the wards made to be easily taken down and disinfected has yet to be realised, but there is much to be said in favour of a simpler style of building for the treatment of disease.

I hope I have not tired you by dwelling so long on Dr. Richardson's address, which, although often referred to, is, I fancy, but very little read nowadays.

At the recent conference on garden cities, Mr. Lever advocated the standardisation of cottage buildings in order to cheapen the cost of building. There is no doubt that a saving can be effected by making the various parts of a house, such as the doors, windows, staircases, &c., in uniform series, and the general dimensions of rooms are more or less fixed; but I think it is to be hoped that such a system may not result in the dreary monotony with which we are unfortunately so familiar in some of our London suburbs.

The exhibition of cheap cottages at Letchworth last year has, I am afraid, given rather a wrong impression; the garden city there is one thing and the cheap cottage exhibition was another, and in many ways the exhibition showed what to avoid rather than what was the latest idea on the subject. As this exhibition was the subject of a paper by Mr. Aldwinckle and Dr. Sykes, I do not propose to touch on it to-night, only just to make these remarks in passing. In a circular widely distributed, giving designs and particulars of cheap country cottages, the walls of which are of timber framing either covered with weather-boarding or corrugated iron, the following note is interesting:—

"Building By-laws.—With certain exceptions, it is our experience that, provided these timber framed dwellings are beyond certain specified distances from other structures, permission is not withheld. In many cases an undertaking to remove the buildings within ten years if called upon to do so has induced the Council to pass the plans. As can be understood, this in most instances eventually means that the buildings are allowed to stand for an indefinite period."

I have always understood that the objection to buildings of this class was not so much their liability to fire as that this method of construction was not suitable for human occupation; on account of the walls and roof being such good conductors the buildings were too hot in summer and too cold in winter, and that they are very liable to become verminous; but it is evident that a good many of these buildings are erected and occupied, and the public authorities, such as the London County Council, in their lunatic asylum at Horton, have made use of this method of construction; the building has been occupied for several years, and it has been found to be quite satisfactory. It is curious to note that in such hot places as Suez and Western Australia corrugated iron is used for the roof and walls; in fact, there is hardly anything else used in Western Australia on account of the scarcity of water; every drop of rain has to be saved, and therefore the most non-absorbent material used for roofs.

The address was illustrated by fifty-four lantern slides.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

A SPECIAL general meeting of the Royal Institute of the Architects of Ireland was held last week at the Institute Rooms, 20 Lincoln Place, Dublin. The president, Mr. W. M. Mitchell, R.H.A., occupied the chair. There were also present:—Messrs. C. H. Ashworth, James H. Webb, H. Allberry, R. Stirling, G. F. Beckett, C. H. Mitchell, Frederick Hayes, George L. O'Connor, James Louis Donnelly, R. M. Butler, W. Kaye Parry, F. Shaw, Frederick Batchelor, Sir Thomas Drew, Frederick G. Hicks, Edwin Bradbury and C. A. Owen, acting hon. sec. Mr. J. M. Mitchell and F. H. Tallan were admitted as members, and Messrs. C. H. Ashworth, Frederick Batchelor, Vincent Craig, Robert Cochrane, F. G. Hicks, A. Hill, W. H. Hill, R. Caulfeild Orpen, C. A. Owen, George P. Sheridan and W. J. Fennell as Fellows. The question of increasing the subscription was considered at some length. The meeting decided, on the proposal of Sir Thomas Drew, seconded by Mr. C. A. Owen, to officially adopt the amended conditions of building contract, as recommended by the Council, after having had the matter under consideration for a long period, and submitting same to counsel. Mr. Ashworth called attention to some objectionable features in the Bill lately introduced into the House of Commons by Mr. Bryce, and the matter was referred to the Council to take action thereon.

THE GUILDHALL LIBRARY.

IN his annual report on the Corporation records, the town clerk states that the calendaring now in progress is likely to prove of more than ordinary interest to the student of London's municipal history, covering as it does the reign of Richard II. when the Courts of Aldermen and Common Council underwent constitutional changes of a drastic order and the City was torn by party faction under the leadership of Nicholas Brembre and John de Northampton. The citizens were divided in their allegiance to the king, who was apt to interfere at times in municipal elections; they were still more divided as to the fishmongers and other victuallers being allowed the upper hand in civic matters. Brembre was by trade a grocer of a livery company, and was one of the king's strongest supporters. Northampton was a draper, and supported the Duke of Lancaster and his party. Both suffered imprisonment and were condemned to death, although only Brembre was executed. The tracing of the fortunes of these two distinguished aldermen of the City and their respective parties—the victualling and clothing trades—in their attempt to supplant each other forms an interesting feature of the calendar. The condi-

Digitized by Google

tion of the records was satisfactory. The total number of readers and visitors at the Guildhall Library was 383,932—a daily average of 1,417. The additions to the library amounted to 926 manuscripts, 1,958 printed books, 330 pamphlets, and fourteen maps and prints. The records of the parishes of St. Alphage, London Wall, and St. Botolph, Aldersgate, and of Bishopsgate Ward had been deposited in the library. The Corporation had expressed its willingness to accept from the Dickens Fellowship a memorial collection of books by or relating to Charles Dickens which was now being acquired or got together. The expenses of the library and museum last year were 6,506*l.* The art gallery was visited last year by 131,287. There was no art loan exhibition in 1905. Miniatures of King Edward VII. and the late Prince Consort were presented by Sir Alfred Reynolds and Sir Homewood Crawford respectively. The gallery had received bequests of two water-colour drawings by Paul Sandby, R.A., and an oil-painting, "A Winter Scene in Amsterdam," by H. Koekkoek.

TESSERÆ.

Ancient Rome.

THE actual circuit of the walls of Rome has been very variously stated. Some of the authorities on the subject have been misunderstood, but others are manifestly in error. The best measurements have been made by the simple process of walking round them. The Servian enceinte, as far as it can be traced, has thus been found to extend to about 8 miles, that of Aurelian to 12¼. This agrees very nearly with the statement of Pliny, that the mænia of Rome had a circuit of 13 m. p. The word mænia has been taken for the walls, and as the walls of Pliny's time were the so-called Servian, it has been thought that for xiii. we should read viii. Mænia, however, properly implies not walls, but continuous edifices, and was used no doubt by the author to indicate the extent of the regions of Augustus, comprehending the actual city of his day. This conclusion is important as it furnishes us with the best data we possess for determining the population of Rome. There are, indeed, a variety of proofs that the suburbs of the city were never either extensive or populous, derived from the paucity of remains beyond the walls, from the practice of lining the roads for miles with sepulchral monuments, from the absence of bridges across the Tiber either above or below the walls, and from the frequent mention of country villages, lanes and retired woods at but a short distance from the gates. We may conclude, then, that the mass of the population was strictly confined to the limits comprised within the walls of Aurelian. Although, however, those walls are above 12 miles in circuit, about the same as the outer boulevards of Paris, it must be observed that they do not enclose a regular figure, and the area they embrace is far less than it would be if the circumference, as at Paris or ancient Athens, approached a circle or ellipse. In the time of Augustus a large proportion of the area was very thinly inhabited, and even in later times indications are not wanting that great spaces within the city were still occupied by gardens and pleasure-grounds, while the extent of the public buildings seems to have constantly increased. The emperors appear to have experienced no difficulty in clearing the ground for their enormous constructions. On the whole, Rome in the Augustan age cannot have stood on more ground than the city of the present day, nor in the time of Aurelian did it occupy a greater space than Naples, and the Italian cities present in many respects the fittest objects to compare with it. When we add that, while repeated fires were thinning the density of habitation, new regulations were introduced for reducing the height of houses; that Trajan fixed the limit at 60 feet, while in London they rise very generally to 70 or 80, and in modern Rome and Naples still higher—we shall be content perhaps with a very moderate estimate of the population of the ancient city. Judging from the extent of the area and the character and density of the buildings, we shall hardly believe that it ever approached to the number of one million.

River Spirits in Art.

The worship of river spirits was the offspring of affection and gratitude, and it is giving a very unfair and false picture of the human mind to ascribe the superstitions to the working of fear alone. These would have represented the river gods as seated on ruins, brandishing rooted-up trees with angry looks, pouring out their sweeping torrents. But no such thing. The lively imagination of the Greeks felt and expressed with an energy unknown to all other nations every emotion of the human soul. They figured the Naiads as beautiful nymphs, patterns of gentleness and of elegance. These they represented as partially attached to the children of men, and their interference in human affairs is always in acts of kind assistance and protection. They resemble in this respect the rural deities of the northern nations, the fairies, but without their caprices and resentments. And if we attend to the descriptions and representations of their river-gods, beings armed with power, we find an attribute which slavish fear never fails to couple with cruelty and vengeance, we shall find the same expression of affectionate trust and confidence in their kind dispositions. They are generally called by the respectable but endearing name of father. "Da Tyberi pater," says Virgil. Bruce says that the Nile at its source is called the *abay* or "father." We observe this word or its radix blended with many names of rivers of the east, and think it probable that when our traveller got this name from the inhabitants of the neighbourhood, they applied to the stream what is meant to express the tutelar or presiding spirit. The river-gods are always represented as venerable old men to indicate their being coeval with the world. But it is always a *cruda viridisque senectus*, and they are never represented as oppressed with age and decrepitude. Their beards are long and flowing, their looks placid, their attitude easy, reclined on a bank, covered, as they are crowned, with never-fading sedges and bulrushes and leaning on their urns, from which they pour out their plentiful and fertilising streams. Bruce's description of the sources of the Nile, and of the respect paid to the sacred waters, has not a frowning feature. Pliny says (lib. viii. 8) that at the source of the Clitumnus there is an ancient temple highly respected. The presence and the power of the divinity were expressed by the fates which stood in the vestibule. Around this temple were several little chapels, each of which covered a sacred fountain, for the Clitumnus was the father of several little rivers which united their streams with him. At some distance below the temple was a bridge which divided the sacred waters from those which were open to common use. No one was to presume to set his foot in the streams above the bridge, and to step over any of them was an indignity which rendered a person infamous. They were only to be visited in a consecrated boat. Below the bridge people were permitted to bathe, and the place was incessantly occupied by the neighbouring villagers.

Correspondence

H.R.H. Princess Christian's Appeal to the Nation on Behalf of the National Committee for the Establishment of Sanatoria for Workers Suffering from Tuberculosis.

SIR,—In the autumn of last year an appeal was made on behalf of the national committee for the establishment of sanatoria for workers suffering from tuberculosis, with a result so satisfactory that the committee have been able to purchase 250 acres of land at Benenden, in Kent, and are about to commence building operations for thirty patients as a start. The foundation-stone will be laid in July next. As further funds are received additional beds will be provided, and the committee earnestly appeal for donations with that object.

It is common knowledge that in its earlier stages consumption is curable, and the national committee have constructed this scheme on eminently practical lines, the principal point of which is that the institution as it is completed becomes entirely self-supporting, without endowment from local rates, voluntary contributions or other forms of charitable subscription.

One concrete example among many will suffice to put the scheme before the public. In this first or model sanatorium provision is made for 200 beds, and the Postal Federation have guaranteed to support twenty-five beds—over 32,000 of its members having undertaken to subscribe 2*s.* per annum for that purpose. Other bodies of workers are making similar provision for smaller numbers of beds.

Dr. Latham stated at the annual meeting of the Hospital Saturday Fund that in London alone 16,000 persons die every year from tuberculosis whose valuable lives might have been saved. This has reference to the disease in its earlier and curable stage, but he computes that no less than

Digitized by Google

80,000 of our metropolitan population are stricken with it in one form or another.

Such a statement made with authority needs no comment to make its impression. If the work of the national committee is to be carried through, and its righteous and humanising influence and example felt through the length and breadth of our land, our earnest appeal must have a ready and generous response.

The committee feel that the scheme of founding self-supporting sanatoria for workers suffering from tuberculosis is the right solution of the difficulty in prosecuting this campaign.

Donations should be sent to the secretary, special appeal fund, Mr. E. Douglas White, 19 South Molton Street, Bond Street, London, W.

HELENA, President, on behalf of the Committee.

Hot-Water and Heating Services.

SIR,—I am instructed by my Council to communicate with you and respectfully draw your attention to the action of the plumbing trade (both masters and operatives) in interfering with the execution of contracts placed in the hands of heating and domestic engineers by architects and other clients, and to the attempts of the plumbers to secure a monopoly of the work of domestic hot-water supply.

The plumbers' claims, which have been made in various places throughout the country, are that all such work in any metal is plumbers' work only, and that it must not be undertaken by heating and domestic engineers. These claims have been successfully resisted, although in some cases the plumbers struck work and caused serious loss and annoyance to all concerned.

This class of work has always been largely carried out by heating and domestic engineers, and the experience of some firms (members of this Association) covers a period of over eighty years. The claims of the plumbers are of quite recent date, and cannot be admitted, as, if acceded to, the monopoly created would be a hardship and injustice not only to the master engineers, but also to the workmen engaged in this special branch of engineering, who by training and experience are thoroughly qualified to do the work in the most efficient and satisfactory manner.

The annexed resolution (Appendix No. 1), which was adopted at a joint conference between representatives of both master engineers and master plumbers, expresses the general position taken up and maintained by the members of this Association.

I am further to advise that, with the object of preventing trouble and giving correct information as to facts, my Council submitted representations to the Royal Institute of British Architects, and an extract from a letter conveying the decision of this body is also annexed (Appendix No. 2). This, you will observe, is strictly neutral and impartial, and gives no support to the plumbers' claims for a monopoly.

As repeated assertions have been made by the plumbers that the Manchester Society of Architects agree that the work in question is plumbers' work only, I further annex (Appendix No. 3) copy of a letter received from this Society which makes it clear that their position is the same as that of the R.I.B.A.

My Council desire me to ask your kind and careful consideration of this matter and the favour of your co-operation.—Yours respectfully,

H. B. WATT,
Secretary of the National Association of Master Heating and Domestic Engineers.

June 6, 1906.

APPENDIX No. 1.

Joint Resolution of Master Engineers and Master Plumbers.

"At a meeting held May 22, 1902, it was mutually resolved by the representatives of the National Association of Master Plumbers of Great Britain and Ireland and the Institution of Heating and Ventilating Engineers that in future it be observed that all leadwork be considered plumbers' work, but that a neutral line be taken as regards all iron, brass, copper or other metalwork which may be executed by engineers or plumbers."

Proposed by Mr. D. M. Nesbit, London, on behalf of the Institution of Heating and Ventilating Engineers, seconded by Mr. J. H. Taylot, Huddersfield, on behalf of the National Association of Master Plumbers, and unanimously agreed to.

APPENDIX No. 2.

Extract from Letter from the Royal Institute of British Architects to the National Association of Master Heating and Domestic Engineers.

"February 27, 1906.

"I am directed by the Council to inform you that the committee apointed to receive deputations from the National Association of Master Plumbers of Great Britain and Ireland, the National Association of Master Heating and Domestic Engineers, and the United Operative Plumbers' Association, with regard to the right of the different trades to deal with hot-water work for heating and hot-water supply, has presented its report with which the Council is in entire agreement.

"I am to inform you that the Royal Institute of British Architects is concerned only with the improvement and efficiency of craftsmanship, and does not concern itself with trade questions. It therefore cannot see its way to lay down any rule or to advise its members as to which trade should have the right or preference in the execution of hot-water work. "(Signed) W. J. LOCKE, Secretary."

APPENDIX No. 3.

Copy of Letter from the Manchester Society of Architects to the National Association of Master Heating and Domestic Engineers.

"March 16, 1906.

"With reference to the circular issued by the Master and Operative Plumbers' Associations, dated March 25, 1903, which emanated from this Society, my Council regrets to hear that it has not been construed in the spirit it intended.

"I am instructed by my Council to inform you that it is in complete accord with the letter, copy of which I enclose, issued from the Royal Institute of British Architects, dated February 27, 1906 [see above], and to inform you that it desires the same to be accepted as its view of the matter.

"(Signed) PAUL OGDEN, Honorary Secretary."

GENERAL.

Mr. Frank Dicksee, R.A., Mr. Leslie Thomson and Mr. Frank Burridge have been selected to assist the Liverpool Arts committee in the selection and hanging of works for the autumn exhibition of pictures promoted by the Liverpool Corporation.

The Royal Glasgow Institute of the Fine Arts have just had a more successful exhibition than they have had for many years. In 1904 the total sales were under 7,000*l.*; that sum has now been exceeded. The first and second winners in the Art Union drawing used their prizes of 200*l.* and 100*l.* respectively to purchase several pictures each.

Sir John Rolleston, of Leicester, the umpire in the arbitration between the Manchester Corporation and the Earl of Wilton in respect of 70 acres of land adjoining Heaton Park, Prestwich, required by the Corporation for reservoir purposes, has issued his award. The amount awarded by the arbitrator is 23,805*l.* The original claim was 45,000*l.*

Large Decorative Panels, executed by Mr. J. Kerr-Lawson for the drawing-room at Stoke Rochford, Lincolnshire, and representing towns and cities of Italy, are on exhibition at the Alpine Club, Mill Street, Conduit Street, W.

The Nottingham Corporation have agreed to lend pictures and other works of art to the local schools.

M. Jean Aubert, the French painter, has died in Paris. The deceased artist entered l'Ecole des Beaux-Arts in 1841 as a pupil of Delaroche and Martinet. He afterwards studied in Italy for five years, and devoted himself to engraving until 1853, when he took up lithography in addition to painting.

The Aberdeen Town Council have granted the honorarium of 200*l.* to Mr. Samuel Milne, gas engineer, for his services as architect of the buildings erected at the Ferryhill electricity works, the cost of which had amounted to 32,221*l.*

Messrs. Hubbard & Moore, architects and surveyors, of 85 Gresham Street, London, E.C, announce their removal to 112 Fenchurch Street, E.C.

The Architect.

THE WEEK.

IT is to be hoped that the election of Mr. ALFRED EAST, A.R.A., as president, will have a beneficial effect on the fortunes of the Society of British Artists. The Society has been hospitable towards young artists, and many men who afterwards became successful were made known through its exhibitions. The new President is one of them. It is true the Society for a long time afforded opportunities for the exercise of sarcasm on the part of critics. But, taken as a whole, the history of the body is creditable. Mr. ALFRED EAST has derived subjects from so many countries he may be considered as a cosmopolite, and we may therefore expect that during his presidency the Society will not appear to be monopolised by a few men. It is the first time an Associate of the Royal Academy has held office, for although CLARKSON STANFIELD and DAVID ROBERTS were presidents, it was prior to their election into the Academy. The old feud between the two bodies is not likely to be again revived.

A CURIOUS case was heard last week in the Brighton County Court, in which a local publisher claimed 8*l.* 8*s.* from one architect and 5*l.* 5*s.* from another, ostensibly for the price of a book entitled "London at the Opening of the Twentieth Century: Contemporary Biographies." From the evidence which was given it appeared that a canvasser called at the office of each of the defendants and applied for particulars of their career. The consideration for the money was said to be not an advertisement but the book itself. Nothing was, however, mentioned about the time when the book was to be delivered. One of the defendants stated that he informed the agent if the book was not delivered in a year he would not have it. The other defendant said that he told the agent he was hardly important enough to be inscribed in such a work. The Judge decided against the plaintiff in one case, because delivery two and a half years after the contract was not delivery within a reasonable time. But in the other case the decision was in favour of the plaintiff. His Honour remarked that the case showed the danger of dealing with touting persons, who generally made much larger promises than they were able to fulfil, and he hoped the warning would be taken to heart. Architects who have attained a position in their profession can bring themselves and their works in a less expensive way before the public.

EDINBURGH was from an early age exposed to attack, and in the time of ROBERT II. the principal inhabitants were allowed to set up dwellings within the castle. The outworks may have formed the defence which was known as the King's Wall. In the time of JAMES II. further defences were constructed. But probably the most important was that known as the "Flodden Wall," which was erected in haste after the battle and when it was anticipated that the English troops would assault the city. Sir DAVID WILSON says "the farmers of the Lothians lent their labourers and horses to the national work; and the citizens rivalled one another in their zeal for the fortification of the capital against the dreaded foe, 'our auld inymis of Ingland.' In an incredibly short time the extended city was enclosed with defensive walls, with ports, battlements and towers, superficial indeed even as compared with the older city wall, yet effective as a protection against the military engineering of the age." A part of the Flodden Wall which remains in the grounds of Heriot's Hospital is now receiving a good deal of attention in Edinburgh. The Governors are about to erect an art school, and they wish to build on the wall. They claim joint ownership in it, as it was rebuilt in 1888 at the joint expense of the Trust and the Corporation. The latter claim the sole ownership, but they will allow the Governors to use it on consideration that the Trust shall keep the wall in good condition, and that the Corporation can use a part of it if necessary. A further instance of caution is that no conveyance of the wall is to be given.

A SANITARY authority can order works to be done in connection with houses, and they can open and examine the ground in order to see if drains are repaired, restored, or the defects otherwise remedied. But apparently there is no authority to examine the works while in progress. This has been exemplified in a case which came last week before the Lambeth Police Court. An order was served by the Walworth Council to have drainage works executed in connection with the Prince Regent buildings. A sanitary inspector visited the place. There he met an ex-sanitary inspector, who had apparently superintended the work on behalf of the owner, and who ordered the official to leave. The magistrate expressed a doubt whether a sanitary inspector was authorised to watch the progress of the works. The solicitor to the Council maintained that unless he did so the work might be covered in, and it could not be examined unless it was uncovered, which would mean expense to the Council. The magistrate came to the conclusion that the inspector was not duly employed in the execution of his duties in visiting premises where drainage was in progress under a notice. The summons was therefore dismissed, but without costs. According to the Public Health (London) Act of 1891 a sanitary inspector can enter premises (1) for the purpose of examining as to the existence thereon of a nuisance liable to be dealt with summarily under the Act; (2) where a nuisance has been ascertained to exist, or a nuisance order has been made, until the nuisance is abated, the required works completed, or the closing order cancelled, as the case may be; and (3) where a nuisance order has not been complied with or has been infringed, for the purpose of executing the order. Apparently the efficient carrying out of the work must rest with the owner of the premises.

THE announcement that the Indian Government has undertaken the responsibility for the preservation of ancient monuments throughout the country will give satisfaction to architects and archæologists, who have witnessed the neglect of structures which one day must be prized. Archæological surveys were permitted under some of the governments, but no systematic efforts were made to secure the safety of the monuments. There are numerous problems connected with the architecture which have not been solved. And although of late innumerable photographs and measured drawings have been made, they cannot have the effect of the works themselves. There are also questions of anthropology connected with the buildings which hereafter will possess increased importance. As FERGUSSON, who did so much to create an interest in Indian architecture, says:—"For certain qualities—not perhaps of the highest kind, yet very important in architectural art—the Indian buildings stand alone. They consequently fill up a great gap in our knowledge of this subject, which without them would remain a void."

FORTUNATELY for trade all parts of the United States are not neglected equally with Oregon, Washington and Idaho, for, according to the British Consul at Portland, not one cask of cement was received from the United Kingdom during the past year. The British manufacturer appears to be, he says, indifferent to that market. The Japanese seem more wide-awake, for it is expected that a large amount of cement will be received from them. There was such a scarcity of cement in the consul's district that prices advanced at one time to 13*s.* a cask. There is an extraordinary demand for concrete and the supplies were not sufficient to meet it. It was therefore under consideration to start local cement works. The report was written prior to the destruction of San Francisco, which has aggravated the dearth of the material.

SHOP FRONTS.

IN an article on the architectural designs now to be seen in the Royal Academy which appeared in this Journal, when referring to those relating to the Regent Street improvement, it was said :—

The designs for the Piccadilly Hotel, which were prepared for the Office of Woods, and the different views of the Quadrant, which were also inspired by the same authority, are enough to make John Nash disturbed when he thinks of the opportunity he lost. He was controlled by cheapness and flashiness. But since the days of the Regency London has increased in wealth, and investors in building can be compelled to accept an expenditure which at one time would be impossible. It would, however, be interesting to have the report of a committee of Regent Street shopkeepers on the designs. They would not be unlikely to maintain that although the new buildings would serve for insurance offices, they are not adapted for the requirements of trade. It will no longer be possible, if the designs are adopted, to have it appear that the shop front is everything, and that it mattered little whether, constructionally or financially, the upper part of the premises were supported by a signboard and a large plate of glass. Mr. Norman Shaw would substitute an arched construction in the ground floors of all the premises in the Quadrant. The Office of Woods can insist on the arrangement. If obeyed it might not be prejudicial to the shopkeepers' interests, and if so we should then expect, as we have said, to witness a change which would be revolutionary.

The petition from the lessees and occupiers of Regent Street to the Commissioners of Woods and Forests can be considered as equivalent to the report which we anticipated. In it they recognise the design as an artistic triumph which would be adapted for such a street as Lombard Street, but if carried out would have a disastrous effect upon Regent Street as a shopping thoroughfare. The style would be too expensive for the ordinary lessee. The heavy columns would occupy a great part of the window space, and as the continuity of the window line would be broken, it would be almost useless for one occupier to have a succession of shops. The windows set back would be entirely hidden from people walking up and down the pavement. It is also believed that the architecture of the Quadrant, if carried out as proposed, would prevent customers from reaching the northern part of Regent Street.

The opinion expressed by the lessees and occupiers of Regent Street corresponds with that which has been urged by shopkeepers not only in London, but elsewhere, whenever the architectural improvement of the shop front has been proposed. Indeed, the opinion is so general it is not uncommon for those who erect buildings containing shops to leave the shop front to be inserted by the lessee or to wait until it can be arranged to suit his desires. It is needless to say that the general wish is to have only one plate of glass in the window, no matter how large may be the area. Manufacturers can now produce plates of immense size, and the financial risks which attend their use are minimised by the aid of insurance offices. In the old days, when glass could only be produced in small panes, shopkeepers were compelled to have windows which did not suggest that the whole of the upper part of the house was supported by glass. As the restriction was general, we suppose no individual could be said to have suffered because it was impossible for him to have such a display of his goods as he may have desired, and which can be recognised without any difficulty in our time.

It must also be allowed by shopkeepers that in London co-operative stores have secured an enormous business without any provision for the display of their goods in windows. That success may no doubt be due to the circumstance of the customers being prepared to suffer some inconvenience for the sake of economy. It is remarkable, however, that in provincial towns the directors of the co-operative stores seek to have more ample window space than ordinary shopkeepers. Indeed, the desire for large windows is so general among traders, it would be idle for an outsider to maintain that with windows of a different description they would be at least equally successful. Human nature abounds in weaknesses, and shopkeepers especially have to accommodate themselves to whims of many kinds. DICKENS was truthful when he made BLAZE & SPARKLE, the jewellers, say, "If you want to address our people, sir, you must remember that you are not dealing with the general public; you must hit our people in their weakest place, and their weakest place is such a place." The public, whether general or select, have a weakness for gazing at shop windows, and it is, we suppose, reasonable to turn it to profitable account. It may seem absurd to believe that rational beings will purchase goods which they do not require as a result of gazing. But the aim of the shopkeeper is to allure them in order that they shall not seek some rival's establishment. Hence it is that window dressing is regarded as an art, which is paid for at a higher rate than ordinary assistance in the shop. On that account also every available inch of space is used to display goods, and if columns happen to be within the enclosure they are wreathed with drapery in order to prevent them becoming a mere obstacle to the view.

There is another reason which is no less important. Every shopkeeper is eager to prevent his windows from being confounded with those of his neighbours. This may be due to a desire to express individuality, but the principal object we believe to be the fear of imitation. Uniform shops of which the use is compulsory are consequently never satisfactory to those who occupy them. In the old days before shopkeeping had attained its present development efforts were made to avoid confounding one shop with another by means of signs from which they took their designations. "The streets," as the "Spectator" said, "were filled with Blue Boars, Black Swans and Red Lions, not to mention Flying Pigs and Hogs in Armour, with other creatures more extraordinary than any in the deserts of Africa." In foreign towns there was a still greater variety. But similar aids to identification would not now be tolerated, and the shopkeeper depends mainly on the character he is able to impart to his shop window. Both public and private authorities always favour uniformity because it gives less trouble than variety. We can therefore see that when suburban estates are laid out as streets for business purposes the shop fronts are of one type. There may be compensation for the objections of the tenants. But it is very doubtful whether, as in such cases there is less necessity for competition, the shops are as profitable as those in which there was no dictation about form.

In all such cases it is well to profit by the experience of foreigners. Now in Europe there is no better example of uniformity of design and of the subservience of shops to the general architectural design than is afforded by the Rue de Rivoli. The line of shops forms an immense arcade. In order to create the rue many of the old streets of Paris were sacrificed. But what kind of shops do we find there? Several seem to depend on the sale of cheap photographs. Others sell trinkets which are supposed to have come from the East. There are a few watchmakers, stationers and booksellers. Mainly the trade is in *objets de Paris* of an inferior kind. No one acquainted with Paris would go there to purchase an article of value. When we consider all the circumstances of an adverse kind which are connected with Regent Street we might say that with similar architectural treatment it would degenerate into a London Rue de Rivoli. A second example is not far distant. The Palais Royale is another vast range of shops of admirable but uniform design, and which throughout all its parts displays the hand of the official architect. But there are few of the tenants who do not complain of the decline in trade. Parisians and visitors to Paris could find enough of uniformity elsewhere, and the restricted dimensions of the shops of

Digitized by Google

the Palais Royale confine the occupiers to only a limited range of articles which are not always in request.

The streets of Paris afford countless variety in the "boutiques." Indeed the appearance of the city would become painful from the perpetual use of white stone and the similarity in treatment, imposed partly by the preference for one style and partly by official regulations, if it were not that some imagination is permitted in the ground floor and mezzanine, the latter being a common accompaniment of the shop. The Parisian lessee does not, however, confide his interests to a trader in shop-fronts. He wishes the property he is to occupy and utilise for profit to become the most attractive part of the building, and he has no difficulty in finding architects who are quite satisfied to put all their ability into a design for a work so circumscribed.

Brussels has been described as Paris on a reduced scale. In that city which is so open to foreign influences we find that strangers as well as natives give a preference to those parts of the city which cannot be considered as displaying the latest improvements. The steep, irregular, and we might say unsatisfactory Montaigne de la Cour, continues to be the principal street of the town as regards shops. Brussels has had to be enlarged from time to time, and fine streets have been created with shops which have a right to be regarded as high-class, but they are mainly used by inhabitants of neighbouring districts. Fashion has its own resorts, which are due to custom rather than to beauty of buildings.

We might refer to other cities as evidence that commercial success does not always coexist with meritorious architecture. This, no doubt, is a perplexing and an annoying circumstance. But it is one which concerns other people besides architects. For that reason we believe that serious consideration should be given to the petition of the lessees and occupiers. It would, no doubt, be a gratifying exercise of power for all who are connected with the Woods and Forests Department to transform Regent Street, and by doing so to demonstrate to the world that one quarter of the Metropolis has a somewhat grandiose character. But who can answer for the public, and guarantee that the new Regent Street will be as attractive to them as the old? It should be remembered that already rival streets are gaining favour. Oxford Street and Bond Street, with others which serve as arteries, are yearly becoming of increased importance. Regent Street, in fact, could afford to have more subsidiary interest. If that could arise from an alteration in the architecture it would be gratifying. But as those most competent to judge on the subject are doubtful, further consideration is demanded.

THE LAOCOON.

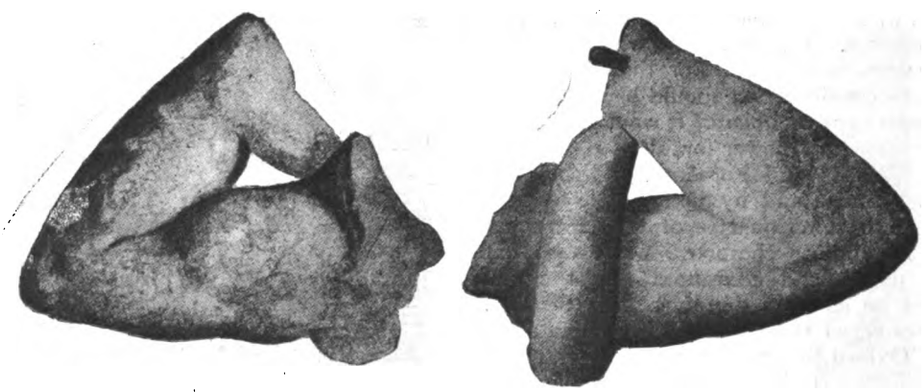
IN 1506, when JULIUS II. was Pope, FELICE DE FREDIS discovered in his vineyard near the Sette Sale at Rome the group of the *Laocoon*. It is easy to imagine the amazement of all who loved art at such a revelation of a class of work of which there were few representatives. On June 1, 1506, the Roman poets held a festival in celebration of the event. DE FREDIS received the substantial reward of a share of the custom dues which had to be paid at the gate of St. John Lateran, and the successor of JULIUS changed the reward by making over to the family the appointment which was then known as *officium scriptoriæ apostolicæ*.

The spot in which it was found is by no means certain. According to PLINY the group was in the palace of TITUS. But later writers seem to think it was most likely the baths of TITUS contained it. RICHARDSON says there were fragments of a similar group found in the house of TITUS, which would be parts of the group described by PLINY. In that case the group which is now in the Belvidere of the Vatican would be only a copy. But RICHARDSON considers it inconceivable that there could have been another work of equal merit. When the work was removed to the Vatican it was, however, defective, for the right arm and shoulder of LAOCOON, the right hand, part of the head and of the feet of the elder son, and the right arm of the younger boy were lost. CLEMENT VII., who was the third in succession to JULIUS II., was dissatisfied with the appearance of the group as well as with the figure known as the *Apollo Belvidere*, which required a forearm and hand. The POPE consulted MICHEL ANGELO, and he recommended that Fra GIOVANNI ANGELO MONTORSOLI, of the Order of the Servites, should be employed as restorer. He was an able sculptor who had carried out several monuments and fountains in various parts of Italy. But whether he was competent to deal with important examples of ancient art may be doubted.

There were so many pieces of sculpture in ancient Rome, we can well understand that a writer like PLINY would hesitate about giving a description in detail of such a group as the *Laocoon*. Probably he would not have referred to it if it were not that the work supported his theory that whenever there was co-operation among artists there was sure to be loss of individuality. He wrote:—"The *Laocoon*, which is in the house of TITUS, is held to be superior to all other works of the

painter and the sculptor. In it the able Rhodian artists AGESANDER, POLYDORUS and ATHENODORUS, worked together in carrying out a concerted plan, which was to form father, sons and the wonderful coils of the serpents out of a single block of marble." The belief that so intricate a group could be carved out of one piece of stone excited the wonder of PLINY. He was, however, under a delusion. For the elder son a different block was used, and the joint can be discerned on close examination. Indeed, some experts say no less than five blocks were needed. It was also doubtful how the three artists could have an equal share in producing the group. WINCKELMANN came to the conclusion that AGESANDER probably was the sculptor of the priest, and POLYDORUS and ATHENODORUS of the two sons. In that way there would be a correspondence between the family of sculptors and the victims they represented.

We can hardly suppose that so remarkable a subject would be neglected by artists until a comparatively late period, for it is believed the *Laocoon* was executed in Rome in the time of TITUS by the Rhodian sculptors. That the subject was earlier treated is evident from various gems and reliefs. A painting of it, but of very



Digitized by Google

inferior character, was found in Pompeii, and this would suggest that the subject had become popular, and that humble artists found little difficulty in discovering an original which they could adapt. Literature furthermore supplied several versions of the legend. LAOCOON was the uncle of ÆNEAS, and hence the subject would have interest for the Roman people. He had committed the unpardonable offence of warning the Trojans about the great wooden horse. In that way he excited the wrath of APOLLO, who sent two monstrous serpents to attack him and his sons. The three were seized when about to sacrifice to NEPTUNE. It has been supposed by LESSING and others that the sculptors adopted the account given by VIRGIL, and of which we give JOHN DRYDEN's translation, but the group is likely to have existed before the poem :—

First about the tender boys they wind,
Then with their sharpened fangs their limbs and bodies grind.
The wretched father, running to their aid
With pious haste but vain, they next invade ;
Twice round his waist their winding volumes rolled,
And twice about his gasping throat they fold.
The priest thus doubly choked, their crests divide,
And towering o'er his head, in triumph ride ;
With both his hands he labours at the knots,
His holy fillets the blue venom blots ;
His roaring fills the flitting air around.

LESSING'S book, we may remark, is intended to demonstrate that although a priest may roar in poetry, the sculptor and painter must be careful to avoid suggesting that he allowed his face to be contorted by his agony. The "clamores simul horrendos ad sidera tollit" becomes in art a subdued groan of anguish. LAOCOON appears to suffer in the group, but he does not in the least degree break the rules of deportment. That being the case it is not easy to explain what the group represents. Is the priest imploring the gods for mercy? DAVID, the painter, who was supposed to know all about ancient art by instinct, said that the movements of the head, of the left arm and of the feet, indicate courage, while the right arm expresses cowardice. He, of course, must have remembered that the right arm was not ancient. Other interpreters suggest that LAOCOON is overcome and has to subside on the altar. In that way his courage would be at an end. According to JOHN FLAXMAN, "the convulsed rise of the youngest from the ground is the most electric circumstance in the whole sentiment." There are others who believe that the boy has just died. The elder son seems to be divided between surprise at the position of his father and a desire to secure his own safety. It is doubtful whether he may not escape the doom of his father and brother. Then, again, the proportions of the boys are not in keeping with their ages. As HOGARTH well remarked, they must have been designed for men, but they are only allowed to be one-half the father's height in order that the pyramidal principle should be respected. The incident which is represented is not, therefore, merely an attack by two powerful serpents ; we are also enabled to judge of the effects produced on three victims who differ in character. If, for instance, LAOCOON has collapsed and is uttering his last sigh, the restoration of the right arm in an almost vertical position suggests a degree of strength which does not agree with the remainder of the body. According to tradition MICHEL ANGELO desired to treat it differently. WINCKELMANN says :—"This arm, around which the serpents are twined, was to have been held in a bent position across the head of the statue. It may have been the intention of MICHEL ANGELO, in this approximation of the arm to the head, to render the idea of suffering in LAOCOON, from which the remainder of the figure is free, stronger by two combined ideas, and through the repeated folds of the serpent to place the greatest pain there, the expression of which the ancient artist has balanced with the propriety and beauty which should be the predominant traits of the figure. But it seems as if the arm, bent over and across the head, would divide the principal attention demanded by the head, as the eye would be attracted at the same time to the convolutions of the serpents about the arm."

A remarkable discovery of a kind which will be doubtful to many people who have had even a slight acquaintance with the trade in antiquities serves to give support to the theory of MICHEL ANGELO. The *Umschau* relates how Herr LUDWIG POLLAK has found among a heap of fragments of statuary the objects which are illustrated, and which he recognised as forming part of a group of the *Laocoon*. Both had been broken and were repaired. If genuine they must have belonged to a group that was on a smaller scale than that in the Belvidere of the Vatican. The world has grown so accustomed to the restoration by the Servite monk, the advantage of the change in the position of the arm is not likely to be quickly recognised. There are fragments of what appears to be a finger or fingers in the hair of the priest in the Vatican group, and that is evidence that the hand was originally on the head. But in its restored state the head becomes free, and its strength, pathos and beauty are more evident. The right arm appears to be a continuance of the line formed by the left arm, and that is also an advantage. MICHEL ANGELO supposed that the right hand of LAOCOON was pressed against his head ; in the fragment it holds the end of the serpent.

FRONT VIEW. REAR VIEW.

In speaking of MICHEL ANGELO in connection with the *Laocoon*, it is remarkable that VASARI, who tells us so much about him, does not mention any project of his for the restoration of the ancient group. VASARI was also the friend of MONTORSOLI. But, although he mentions that the monk obtained the order to complete the figure, he does not describe how it was carried out. In his Life of BACCIO BANDINELLI we are told by VASARI that he not only made a replica of the group for the King of France in a very perfect manner, but that he also restored the arm of the antique *Laocoon*. "For the right arm of that figure having been broken and not being found, BACCIO made one of the proper size in

Digitized by Google

wax, which so closely resembled that of the antique statue in the muscular development, the force and the manner of the work, uniting with the ancient part, moreover, to such nicety, that it served to show how well BACCIO was acquainted with his art." It is therefore not improbable that the extended arm of LAOCOON should be ascribed to BACCIO rather than to the Servite sculptor. Certainly no other arm by sculptor or painter has been made the subject of so many disquisitions or has given rise to such diverse speculations. But as GOETHE says in treating of the *Laocoon*, "a genuine work of art corresponds with a work of nature and remains for ever a task for our understanding which is endless."

RIGIDITY OF CONSTRUCTIVE MATERIALS.

THE relative rigidity of the materials of construction, as shown by their moduli of elasticity, is exhibited, says Mr. James E. Howard in the *Engineering Record*, in the accompanying table of numerical values. The data used in their preparation are from the results of tests made at the Watertown Arsenal, although some of the data might, of course, be had from many other sources.

These ratios of stress to strain are based upon the effect of loads within the elastic limits of the materials. For those cases in which the elastic limits were not well defined, by reason of the early and progressive development of permanent sets, the resilient movements were used instead of strains under direct loads. Tensile stresses were applied to the steel, wrought-iron, cast-iron and bronze, compressive stresses to each of the other materials here represented.

The results of a number of tests on each kind of matelria were examined and representative moduli selected for the present exhibit.

Steel displays the highest modulus of elasticity of any of the materials of construction. It also has a more nearly constant value than any of the others. Its modulus is found to remain in the vicinity of 29,500,000 to 30,000,000 lbs., with great persistency, notwithstanding the chemical composition may extend over the limits of ordinary commercial steels.

It follows that mild steel and hard steels will each extend, compress or deflect substantially the same amounts for the same loads, the elastic limits not being exceeded in any of the grades.

In respect to imparting a higher modulus no method of treatment has been found whereby it may be elevated above its normal value.

Moduli of Elasticity.

Material.	Modulus of Elasticity. Pounds per Square Inch.
Steel	29,500,000 to 30,000,000
Wrought-iron	26,800,000
Cast-iron	14,300,000 to 18,000,000
Bronze	10,000,000 to 14,300,000
Granite	5,000,000 to 9,800,000
Marble	4,000,000 to 15,000,000
Limestone	4,000,000 to 14,700,000
Slate	16,200,000
Bluestone	7,000,000
Sandstone	1,100,000 to 4,000,000
Bricks, hard	10,000,000
Bricks, light hard	4,500,000
Bricks, salmon	500,000
Portland cement	4,000,000
Natural cement	1,100,000
Long leaf pine, butts	2,200,000
Long leaf pine, tops	1,600,000
Short leaf pine	1,500,000
Douglas fir	1,800,000
Spruce	1,500,000
White oak	1,500,000

It is conjectured that a higher modulus might be realised for the time being by exposing the metal to very low temperatures, since the opposite effect results from raising the steel above the range of atmospheric temperatures. At 1,400 degs. Fahr. the modulus appears to have fallen to about 14,000,000 to 16,000,000 lbs. per square inch. The rate of reduction is not thought to be uniform, but increasing as higher temperatures are reached.

The modulus of elasticity may be lowered temporarily by overstraining the metal at ordinary temperatures. From this state there is an early recovery. A return to the normal value has been observed to take place within the limits of a few weeks. The modulus stands as an index of an inherent property of the material, and this characteristic is practically beyond our control.

Wrought-iron has a value next to that of steel. Cast-iron then follows, for which two values are given, indicating the limits within which the modulus may be expected in different grades of cast-iron.

Iron, as such, is the dominant constituent in each of these three cases. The lower and variable value for cast-iron is attributed, in part, to its less dense structure compared with puddled iron or steel.

Although little may be done, and that of a temporary character, to modify the rate of extension or compression of steel, yet the total range or amplitude of the strains admit of decided change. When this range is increased it merely means that the metal has had a higher elastic limit imparted to it.

Bronze, as a comprehensive name, includes various compositions the principal constituents of which are copper, tin and zinc, with which iron and manganese are used in some very strong mixtures. The modulus reaches the value shown occasionally, but more frequently the range is from 11,000,000 lbs. to 13,000,000 lbs.

Among the building stones, slates, dolomites and some of the limestones comprise the more rigid examples. Contrary to the general conception of a granite, this rock has not been found to possess so high a modulus as the stones just mentioned. Statuary marble, the weaker limestones and certain granites display the lower values of their respective classes.

Sandstones generally are quite compressible, and some have furnished the lowest moduli among the list of building stones.

Bricks display a wide range in compressibility, salmon bricks representing the most compressible, hard-burnt bricks the most rigid. With the increase in the modulus of elasticity there is an accompanying gain both in density and in compressive strength. A marked improvement in the strength of piers could, no doubt, be effected by careful selection of the individual bricks, at the same time giving due consideration to the quality of the mortar in which they are laid.

An ordinary value for the modulus of elasticity of Portland cement is 4,000,000 lbs. per square inch. Age does not appear to effect a decided modification in this value in individual cases, although age has a pronounced influence on the development of permanent sets.

The highest modulus which has been observed in a Portland was 5,854,000 lbs. per square inch. This resulted from subjecting the cement to a very high pressure while setting. Natural cements show moduli much below the Portlands. These two kinds of cement not infrequently have the same specific gravity in the unhydrated condition, but after gauging and setting the Portlands have the greater weight per cubic foot and the greater density. The difference in the shapes of the grain suggests a reason for the lesser density and lower modulus of the natural cements in the cake, notwithstanding their specific gravities are often the same as Portlands.

The moduli of elasticity of cement mortars and concretes depends upon the richness of the mixtures, modified by the conditions of loading. Values in the vicinity of 5,000,000 lbs. are occasionally met in rich mixtures, and drop to below 1,000,000 lbs. in the case of very lean ones. The application of a higher stress changes the value of the modulus, as it had previously existed taken over a lower range of stress. This is an important feature in reinforced concrete, since the ratio of the modulus of elasticity of the steel reinforcement to the concrete is not a constant one.

No wide variation in the values of the modulus characterises the several kinds of timber in common use. In long leaf pine the butts show a higher modulus than the tops of the trees. Short leaf pine and the tops of long leaf pine each display about the same value.

Douglas fir is usually slightly more rigid than spruce and some oaks. Spruce and oak frequently have about the same modulus, the more rigid sticks of the latter surpassing those of the former.

The moduli of wood, above referred to, are for stresses applied lengthwise the grain. Decidedly lower values prevail when loaded perpendicular to the grain, and a difference is also found between loads applied in radial and tangential directions, with respect to the position of the stick in the tree. In one instance the modulus in a radial direction was only one-eighth its value taken in a lengthwise direction.

Digitized by Google

Comparing the radial with the tangential moduli, the latter has been found with but one-half the value of the former.

In tension the modulus of wood is substantially the same as in compression.

TESSERÆ.

The Nimbus.

THERE seems to be no doubt that this method of representing excellence or power is derived from classical antiquity. There are instances where the deities as well as personifications of moral virtues, and even the emperors, are distinguished by the head being encircled with the nimbus. It probably originated among the fire-worshippers of the East, and in reality represents fire or flame emblematical of the Divine power and intelligence emanating from the head. In Persia and other eastern countries at the present day the heads of sacred personages are surmounted or surrounded by a mass of flame rising up into the air like a pyramid. In the earliest Christian monuments the nimbus is not found even when the Deity is represented. The sarcophagi and frescoes in the catacombs of Rome represent the Father and the Son either with no nimbus or with the plain nimbus which at a later period was the attribute of saints and angels. Even as late as the twelfth century we sometimes find the divine person represented with the plain nimbus. Its form was not always circular. In some instances it is triangular, rising up in the form of a pyramid, the point being over the head. This form is found in Italy and especially in Greece, and was considered as emblematical of the Trinity. The nimbus as the emblem of power or excellence is not confined to the divine persons or to the saints. The personages of the Old Testament are sometimes distinguished in the same manner. In a monastery in Mount Hymettus in Attica, Adam has a nimbus; in some of the early paintings in churches in France the prophets, some of the Jewish kings, Abel, Melchizedek, Jacob, &c., are represented with the same attribute. The Virgin Mary, it may be observed, has the nimbus often richly ornamented, but never with the cross, which is the exclusive attribute of the Deity. Allegorical figures also, such as the cardinal virtues, the winds, the elements, day and night, &c., are not infrequently accompanied with the nimbus on Christian monuments. In the East the nimbus was used still more widely than in the West; it was there often applied to mark power, whether good or evil.

Carvings of Stalls.

These sculptures range in date from the thirteenth century to the age of the Reformation, and are distinguished by various degrees of excellence. Sometimes they are very rude, but more commonly, like the illuminations on some manuscripts, they possess a considerable share of artistical skill. Found on the Continent as well as in England, the general character of the subjects is so uniform that we might almost suppose that the carvers throughout Europe possessed one regular and acknowledged series of working patterns. Yet there is a great variety in the details of the subjects and in the manner of treating them. It may be observed that the ornamentation consists generally of a subject immediately supporting the bracket and of two side lobes or cusps springing from the latter. These side ornaments consist sometimes of mere foliage attached to the bracket by a stalk; sometimes they are grotesques, or separate subjects having little or no connection with the central piece, while they are often a dependent and important part of the story represented under the bracket. Writers of vivid imaginations have given them no less a variety of interpretations. Some have conceived them to be satirical attacks directed by the monks at one another or at the secular clergy, while others have imagined that these strange and grotesque figures embodied in allegorical form the deepest mysteries of our holy faith. Each of these opinions was equally far from the truth. In all probability neither the designers nor the carvers were monks, although it is evident they were men of a certain degree of education and well acquainted with the popular literature of the day, the different classes of which are here represented in pictorial form. In this point of view they are valuable as artistical monuments, while they illustrate in a most interesting degree the manners and habits of our forefathers.

Early Church Windows.

It is a common error to believe that the most ancient windows are those composed of only a single opening or light, for many without mullions may be found as late as the fifteenth or sixteenth centuries. The small dimensions of windows has also been regarded as a proof of antiquity, without considering the respective purposes of such apertures or the relative dimensions of the buildings to which they originally belonged. In the small village church of Early Norman architecture the windows are remarkably small, being in some instances only round holes seldom exceeding 9 or 10 inches in diameter, being splayed off internally to disperse the light. Examples may be found in some few churches still remaining in Norfolk. These little circular windows were superseded by small semicircular-headed narrow windows, or rather loopholes which seldom exceeded 8 or 10 inches wide by 3½ or 4 feet in height. Examples are to be found at Witlingham, Ingworth and Gillingham, in Norfolk. Such was the gloominess of the ancient churches thus lighted that most of them were altered by the insertion of larger-sized windows (while the small ones were still left). Subsequently during the fourteenth, fifteenth and sixteenth centuries these new windows gave place to larger openings divided by mullions. On examination of the plans of these early windows there is reason to believe that they had not originally any glass, as there is no rebate or groove for its insertion. Though the use of glass for windows was known in this country as early as the eighth century, it does not follow that the openings in small churches were glazed before the reign of William Rufus. At the time when the narrow windows (not exceeding 10 inches wide) were used in small churches windows of the same date, more than 3 feet wide, without mullions were inserted in cathedrals and large churches and monastic buildings. As a further proof that the smallness of the window is no positive indication of its antiquity, we find in the sixteenth-century church at Harlow, in Essex, windows which are not much larger than the specimens to be found in work of the tenth and eleventh centuries.

Timber Churches.

There is abundant evidence to prove that in the early ages of Christianity many ecclesiastical establishments in this country were constructed entirely of wood. Bede relates that in 627 Edwin the king, on his conversion from paganism, was solemnly baptized and initiated into the mysteries of the Christian religion in a wooden church on the spot where now stands the cathedral of York. The first church at Lindisfarne, in Holy Island, was constructed in 652 of sawn oak and thatched. William of Malmesbury mentions a church of wood at Dutlinge in Somersetshire; and Ingulphus relates that the abbey of Croyland, with all the extensive outbuildings, was formed of wood and boards, exactly joined and beautifully worked, with the exception of the roof, which was covered with lead. In a charter to Malmesbury Abbey, granted by King Edgar, occurs a clause relating to certain reforms necessary to the welfare of the establishment. It is there expressed "that having often attentively considered what return he should make to God for the extraordinary prosperity he enjoyed, he came to this resolution: that he would restore the sacred monasteries which, by being composed of rotten shingles and worm-eaten boards, Divine service was neglected in them and they were almost deserted, and had issued gifts from his treasury for the repairing of the ruined edifices." In early records connected with Glastonbury we find that a church was erected there of pieces of wood wattled together after the fashion of hurdles. The curious illustrations of Cædmon's "Metrical Paraphrase," as well as other Anglo-Saxon manuscripts, exhibit many examples of palaces and churches evidently formed of wood. In the Cotton MS. an example occurs of a building in which Harold is represented as sitting receiving the Magi. This is evidently of wood wattled together as before mentioned. Probably the only existing remnant of these primitive structures is to be seen at Greenstead in Essex. We have it recorded that in this place was enshrined the body of Edmund the Martyr, a king whose life and death have formed themes for songs of the old Saxon poets, for the miracle-workers of that and subsequent periods and traditions in that neighbourhood, which time for ages after the last timber has crumbled to dust will not obliterate.

Tradesmen's Signs of London.

The rapid strides which have taken place in the form of renovations to accord with the tastes of the present race of the citizens of London have conspired to erase almost all traces of the curious signs which formerly occupied so prominent a place in their streets. These signs may fairly be regarded as a species of heraldry or symbolism, and as such

Digitized by Google

are deserving the attention of the antiquary, not only in exhibiting peculiar features in the appearance of the city, but as illustrating the manners and customs of our ancestors. Although, as a rule, these distinguishing marks have been abolished, we have still types of the custom preserved. The introduction of devices and signs against the houses in London was probably resorted to as the only means of identification, as it is well known the introduction of numbering houses was not adopted till the middle of the eighteenth century, from which period we may date the gradual disappearance of signs. These distinguishing marks were not only used by tradespeople and places of resort, but by private families; at the same time the practice was not universal, as many were content to describe their houses by the proximity to their neighbours or to objects of note, as "over against the Condyte," "neer to the Maypole," "next Paull's Cross," &c. William Faithorne, the engraver, gives his address in 1691 "at the sign of the Ship, next door to the Drake, opposite to the Palgrave Head tavern without Temple Bar;" and in an advertisement in 1701 of a public exhibition "at the White Head, near Pall Mall, facing the Haymarket, within two doors of the glass lamps." Amongst the many objections which were raised against signs and called for their removal, was that the owners did not always keep them in a proper state of repair, but allowed them to be blown down on the heads of the people. In 1718 the Court of Common Council appointed a committee to consider the subject of the removal of these nuisances, which were ordered henceforth to be fixed to the front of the houses, flat against the wall. The spirit of improvement did not stop here; the water-spouts which had served to distribute their contents over pedestrians were removed, the streets were for the first time inscribed at the corners with their names, brass plates were introduced on the doors of the gentry, and the numbering of houses completed this portion of the great work of amendment.

Burgundian and Tudor.

So far back as the reign of King Edward IV. a mode of building, of a new character of domestic architecture as applied to palatial structures, was introduced in England. In the middle of the fifteenth century (for there are no satisfactory proofs of an earlier date), under the auspices of Philip the Good, Duke of Burgundy (1419-67), a peculiar invention of civil architecture appears to have originated, and was certainly much practised within his dominions; it may fairly be considered as a distinct mode, and denominated the "Burgundian." In that prince's palace at Dijon its features and discriminations were first exhibited, and these were carried to a higher degree of excellence in the Hall of Justice at Rouen, and likewise in similar edifices at Bruges, Brussels, Ghent, &c. The "Maison de la Pucelle" at Rouen is an admirable specimen of the Burgundian domestic architecture. Our English architects soon adopted in part the Burgundian style, aided probably by the increasing intercourse between Flanders and England. When any memorable change in the construction or ornament of any considerable castle or mansion house took place, the novel mode of building was adopted by others; such a transition from rude and massive strength to light and picturesque decoration may be traced with scarce less certainty than in sacred architecture; and although so few instances remain, they are equally to be referred to their own era. The Burgundian may be therefore considered, says Dallaway, as the true prototype of our Tudor style, and as being merely confined to the two two first reigns of that dynasty. A principal innovation in the early Tudor style was the introduction of gate houses, bay windows, and quadrangular areas of which castles constructed for defence could not admit. As to their materials, freestone or brick, they seem to have depended entirely upon the greater facility with which they might be acquired, and they were not unfrequently mixed. Trevisi and Holbein introduced both terra-cotta or moulded brickwork for rich ornaments and medallions, or bas-relievos fixed against the walls, plasterwork laid over the brick wall, and sometimes painted as at Nonsuch, and square bricks of two colours highly glazed and placed in diagonal lines, as at Layer Marney. The chimneys were clustered, and composed of columns twisted or wrought in patterns, with heads or capitals embossed with the cognisance of the founder, as at Thornbury Castle and Woolterton manor-house. Gateways were considered as a great feature in all these edifices, and constructed with most expensive ornament; that at Whitehall, designed by Holbein, was composed of square glazed bricks of different colours, over which were appended four large circular medallions of busts, afterwards preserved at Hatfield Peverel. It contained several apartments, but the most remarkable was the little study, called the New Library, in which Holbein was accustomed to employ himself in his art, and the courtiers to sit for their portraits. It was probably in this chamber that the well-known offence took place, of his resentment of an affront offered to him by a nobleman, and which is related by all the biographers of this great artist. The gateways at Hampton Court and Woolterton afford similar specimens.

Milan Cathedral.

In the Milan Duomo there is much of that ecclesiastical grandeur which in St. Peter's is wanting. There are, however, no gold soffites, no mosaics, nor various coloured marbles: one material only presents itself, and the entire effect rests in the design alone. Critically speaking, however, the cathedral of Milan abounds in the offence of incongruity, and it is this which must render it inferior as a model to several churches in England, Germany and France, although the latter may yield to it in scale, and although they cannot vie with it in costliness of decoration or material. The value of a gigantic exterior should not depend upon that microscopic examination of detail without which Milan Cathedral cannot be estimated, and by which we rather learn to prize the curiosity than to eulogise the true excellence of the work. The west front, with all its exquisite workmanship and marble wealth, is no more worthy of imitation than the naked brickwork of the unfinished cathedral at Florence. It is as offensive a combination as the language of the territory. In the one case we have Italianised Gothic, in the other Frenchified Italian—both abominable. The interior of the Milan church is also disfigured by several pieces of altar and monumental furniture either of a debased or wholly unfitting style of architecture, nor can we admit that the arches of the great nave have sufficient spring and richness. In fact, the vaulting generally is too simple, considering the superabundant richness of the exterior and parts of the interior. From the lantern, which is elegance exemplified, we look down upon a forest of pinnacles, each of which exhibits as much decoration as would give ample richness to the spire of a parish church. The flying buttresses are also individually beautiful and afford a most fascinating perspective. The lateral elevations and altar ends of the exterior are equally estimable both in respect to their general effect and exquisite details. Canopies of loftiest state and tracery fanciful as the poetry of "Midsummer Night's Dream," are here pervading. The interior, with its faults above quoted, is still distinguished by predominant excellence. The multiplied perspective of the nave and high embowered roof terminating in the angle of infinity bewilder cool judgment in their influence upon the soul. In the generally subdued body of light we are reminded of that mist of uncertainty which veils the future. In the bright effulgence of partial day we see the gleam of revealed truth.

Oriental Churches.

A Byzantine church might most fitly be defined as a gabled Greek cross, with central dome, inscribed in a square or quasi-square. This square has on the west an addition, not usually under the same roof, and sometimes a mere lean-to, and is on the east, externally for the most part, and almost always internally, triapsidal. The interior arrangement involves a fourfold division, into bema or sanctuary, choir, nave, narthex. The sanctuary is strongly marked off from the choir, the nave from the narthex. The choir and nave are less distinctly, and often not at all, separated. The narthex forms the western addition above named. The doors from one part of the church to another are more numerous and important than among the Westerns. The doors (1) between the bema and the choir—answering to our altar-rails—are called the "holy doors," a term often used among ourselves for the doors of the chancel-screen. The doors (2) between the choir and the nave are the "royal" or the "silver doors." Those (3) between the nave and the narthex are the "angelic doors"; and those (4) between the narthex and the porch, or the exterior, are the "beautiful gates."

Mr. W. Carruthers Laidlaw, 4 York Buildings, Edinburgh, has been successful in the competition for designs for an infectious diseases hospital for East Fife. Mr. Morham, city architect of Edinburgh, adjudicated on the twenty-five sets of plans submitted.

NOTES AND COMMENTS.

ON Monday next the evening studio of the Architectural Association will come to an end. An address on the occasion will be delivered by Professor PITE. It was, we suppose, difficult to keep two schools going—the day school and the evening being to some extent rivals—and the older experiment must be superseded by the younger, for which it served as a pioneer. The change is another step in the transformation of the Association, and which eventually will deprive it of its original character as the most successful of all the mutual improvement societies. Under Mr. WILLIAM G. B. LEWIS the evening studio has been successful; and with a man who is an enthusiast for architecture, and gladly bestows the aid which his experience gives him on students, it could hardly be otherwise. It might be imagined that with so peculiar a plan of training, rivalry between students so differentiated as those of the day and evening classes would be advantageous; but the Council are no doubt the best judges of the means to success.

THE sanguine philanthropists who are assured there would be no loss if the rural and other authorities erected houses for the working classes are likely to be disappointed when the report of the select committee now considering the subject appears. One of the officials of the Local Government Board said on Monday that hitherto there has been generally a loss. As a rule it was found that a cottage costs 200*l.*, and rent to provide interest at the rate of 2¾ per cent. on that sum, with an allowance for paying off the debt, was not obtainable. Local rates had to be increased, and the population in consequence emigrated from small towns and villages. One case was cited where the rates imposed in a Suffolk village in 1867-8 were 2*s.* 7¼*d.* in the pound, the population being 208 and the number of inhabited houses 39; whereas in 1901 the rates were 7*s.* 8*d.* in the pound, there were 36 inhabited houses, 6 uninhabited and the population was 106. Alderman THOMPSON, of Richmond, who is a leading authority on the subject, presented a return showing that of 578 cottages the cost of building averaged from 40*l.* to 70*l.* a room, and charging 2*s.* 6*d.* per week—which was the rule—for each 100*l.* expended, the rents were greater than a workman could pay. He considered that if standardising were adopted for the different parts of the cottages the cost would be largely reduced. Another obstacle to cheap construction was, in his opinion, the number of builders who contrive to get elected on the building committees of various towns.

THE summer meeting of the Royal Society of Antiquaries of Ireland will be held in Killarney during next week, commencing on Monday. That is a region in which it will be difficult to pursue serious studies, for all the points of interest are to be visited. Parts of Thursday and Friday will be devoted to other picturesque regions, viz. Tralee, Ardfert, Aghadoe and other places. The papers to be read relate to subjects which are more or less local. But unless the weather is unpropitious they are not likely to be discussed at great length.

IT is doubtful whether any modern group has been so severely criticised as the *Dance* by CARPEAUX. If compared with its companions which stand in front of the Opera House in Paris it may be considered as animated, for if it does not express the poetry of motion, at least it suggests the unrestrained delight of bacchantes. When it was first revealed there was an outcry against so much abandonment having a permanent position in so public a place... As the authorities declined to remove the group a staining fluid was poured on it, which to many appeared as a sign of the downfall of the Empire. Rain has been allowed to inflict many other stains upon the work of CARPEAUX and as the surface has also suffered from the atmosphere, there is a proposal to remove it to the Louvre or the Luxembourg, and to set up a copy instead. The majority of people in Paris are aware that two blocks of marble were employed for the group, for the junction is evident to all eyes. It now appears there are several pieces, and if removal is attempted it will be impossible to avoid injury to the work. There is a belief prevailing that the Opera House serves as a memorial of Imperial rule. Ardent Republicans are accordingly admirers of it. If proper provision had been made to carry off the rain falling on the building, the *Dance* would now stand in need of no extraordinary protection, but while the authorities are deliberating it would be well to enclose the group with class.

THE "Class Illustrations" published by Mr. BATSFORD will increase the utility of Messrs. FLETCHER'S "History of Architecture on the Comparative Method." The information in the pages of that work has been condensed, and a lecturer can enlarge upon the statements with advantage to students. With the aid of the separate illustrations it would not be difficult to instruct a large class. The 300 plates are divided into four sections, viz. Classic and Early Christian, Romanesque and Gothic, Renaissance and Modern, and Non-Historical Architecture. The plates are printed on one side only, but they comprise over 2,000 subjects. Diagrams measuring 40 inches by 27 inches are also obtainable; and the two classes meet a want as substitutes for hand-drawn diagrams, which are expensive and difficult to produce.

ILLUSTRATIONS.

60, 62 AND 64 BROMPTON ROAD, S.W.

THIS building has lately been erected in the Brompton Road, S.W., consisting of shop with basement and mezzanine floor and four floors above for flats or offices. The front towards Brompton Road is faced with Messrs. DOULTON'S Carrara terra-cotta and red pressed bricks. The roof is covered with green Westmorland slates. The shop and mezzanine fronts are of mahogany.

Messrs. J. ALLEN & SONS, of Kilburn, were the general contractors, and Messrs. R. MORELAND & SONS, LTD., supplied the steelwork.

Mr. R. A. BRIGGS, F.R.I.B.A., was the architect, from whose designs and under whose superintendence the work was carried out.

PHŒNIX INSURANCE COMPANY'S NEW OFFICES, LEEDS: VIEW OF FRONT, SOUTH PARADE—INTERIOR OF OFFICES.

THE DOLPHIN, WALSALL.

THIS house has been erected for Messrs. WM. BUTLER & Co., brewers, of Wolverhampton, the builder being W. WISTANCE, of Walsall, and the terra-cotta being supplied by Messrs. GIBBS & CANNING, of Tamworth, from designs by Messrs. J. H. HICKTON, F.R.I.B.A., and H. E. FARMER, F.R.I.B.A., architects.

THE ELEPHANT AND CASTLE, WOLVERHAMPTON

THIS is a rebuilding for the Manchester Brewery Co. The faïence was supplied by Messrs. GIBBS & CANNING, the electrical work by W. H. PRICE & Co., of Walsall; and Messrs. SPEAKE & Son, of Wolverhampton, completed the work from designs by Messrs. J. H. HICKTON, F.R.I.B.A., and H. E. FARMER, F.R.I.B.A., architects.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Sir John Taylor, K.C.B., vice-president, in the chair.

The Annual Elections.

The results of the elections, as reported by the scrutineers, were declared as follows :—

THE COUNCIL.

President.—Thomas Edward Collcutt.

Vice-Presidents. — James Sivewright Gibson, Edwin Thomas Hall, Henry Thomas Hare, Leonard Stokes.

Hon. Secretary.—Alexander Graham, F.S.A.

Members of Council. — Reginald Blomfield, A.R.A., M.A.Oxon, F.S.A., John James Burnet, A.R.S.A. (Glasgow), William Douglas Caröe, M.A.Cantab., F.S.A., Alfred William Stephens Cross, M.A.Cantab., Edward Guy Dawber, William Flockhart, Ernest George (past vice-president), John Alfred Gotch, F.S.A., (Kettering), Edward Augustus Gruning (past vice-president), Edwin Landseer Lutyens, Charles Edward Mallows, Edward William Mountford, Ernest Newton, William Alfred Pite, Andrew Noble Prentice, George Halford Fellowes Prynne, John Slater, B.A.Lond. (past vice-president), Paul Waterhouse, M.A.Oxon.

Associate Members of Council.—Henry Arthur Crouch, William Adam Forsyth, Sidney Kyffin Greenslade, Henry Vaughan Lanchester.

Representatives of Allied Societies.—Henry Dare Bryan (Bristol Society of Architects), Harry Sutton Chorley, M.A.Oxon. (Leeds and Yorkshire Architectural Society), Edmund Kirby (Liverpool Architectural Society), William Mansfield Mitchell, R.H.A. (Royal Institute of the Architects of Ireland), James Milne Monro (Glasgow Institute of Architects), Harbottle Reed (Devon and Exeter Architectural Society), Harold Ogle Tarbolton (Edinburgh Architectural Association), Howard Henry Thomson (Leicester and Leicestershire Society of Architects), John Henry Woodhouse (Manchester Society of Architects).

Representative of the Architectural Association (London).—Robert Shekleton Balfour.

STANDING COMMITTEES.

Art.—Fellows : Reginald Blomfield, A.R.A., M.A.Oxon., F.S.A., William Douglas Caröe, M.A.Cantab., F.S.A., Edward Guy Dauber, Ernest George, James Sivewright Gibson, Henry Thomas Hare, Professor William Richard Lethaby, Ernest Newton, Edward Schroder Prior, M.A.Cantab., F.S.A., Paul Waterhouse, M.A.Oxon.—*Associates* : John Anderson, Robert Shekleton Balfour, Arthur Thomas Bolton, William Adam Forsyth, Sidney Kyffin Greenslade, Henry Vaughan Lanchester.

Literature. — Fellows : Reginald Blomfield, A.R.A., M.A.Oxon., F.S.A., Alfred William Stephens Cross, M.A. Cantab., Professor William Richard Lethaby, Edward Schroder Prior, M.A.Cantab., F.S.A., Halsey Ralph Ricardo, Professor Frederick Moore Simpson, Professor Ravenscroft Elsey Smith, Richard Phenè Spiers, F.S.A., Hugh Stannus, A.R.C.A., Paul Waterhouse, M.A.Oxon.—*Associates* : William Adam Forsyth, Frank Lishman, William Henry Ward, M.A.Cantab., Percy Leslie Waterhouse, M.A.Cantab., Arthur Maryon Watson, B.A.London, Percy Scott Worthington, M.A.Oxon.

Practice.—Fellows : William Henry Atkin Berry, Charles Henry Brodie, Max Clarke, George Hubbard, F.S.A., Joseph Douglass Mathews, John Murray, Sydney Perks, Alfred Saxon Snell, Thomas Henry Watson, William Henry White.—*Associates* : Edward Greenop, Edwin Richard Hewitt, Herbert Hardwicke Langston, Thomas Edward Pryce, Augustus William Tanner, Robert Stark Wilkinson.

Science.—Fellows : Thomas William Aldwinckle, Max Clarke, Bernard John Dicksee, Matt Garbutt, Francis Hooper, Charles Stanley Peach, Sydney Perks, Herbert Duncan Searles-Wood, Alfred Saxon Snell, Lewis Solomon.—*Associates* : Robert John Angel, Henry William Burrows, F.G.S., Edwin Richard Hewitt, George Pearson, Augustus William Tanner, Ernest Alexander Young.

The hon. auditors are Messrs. Sydney Perks (*F.*) and William Arthur Webb (*A.*).

The London Traffic Commission Report.

Professor BERESFORD PITE, in opening the adjourned debate to Mr. Paul Waterhouse's paper which was read on May 21 last, said he thought the proposal of the Commission was primarily a matter for architects. It was certainly a question for architects rather than for engineers, and he ventured to suggest that since it was a matter of building, so long as the buildings of London were architectural the solution of the problem primarily concerned the architectural profession. The speaker then briefly dealt with the scheme in the manner in which it was presented in Mr. Waterhouse's paper. He said he would like to make a suggestion with regard to the formation of any new roads in London, and directed attention to the course of the river. The configuration of London was practically the configuration of the river and of its hills—Ludgate Hill and Pentonville Hill, &c. The river took a course shaped like a great S, with St. Paul's as one centre and Westminster as another. The traffic had adopted that curved line, and this should be recognised when discussing new schemes. The proposed new thoroughfares were not altogether satisfactory, and some of the terminations of the routes in the alternative scheme were open to criticism, for they seemed futile in their purpose. The eastern roads in London had a tendency northwards from the Bank, which was probably owing to the existence of the Docks. The great east to west road had the effect of drawing traffic away from the City, and in the same way the north to south thoroughfare did not seem satisfactory, because it rather neglected the tendency to approach the City—the heart of the Metropolis—and yet it did not relieve the north-western access, but only emphasised the difficulty. The south road also avoided the City. Speaking generally, the speaker said the western district was provided with an ample number of good thoroughfares. There were parallel streets to the main roads which relieved the congestion of traffic. To the south of Oxford Street there was not the same facility of movement from east to west, but they had to recognise the position of the Park. It would be obvious, he thought, that any improvement of means of access to London should follow the existing tendencies of the main thoroughfares. They rejoiced to hear a proposal which, if carried through, would demolish some of the existing buildings, but still he would like to suggest that London possessed a very large number of exceedingly beautiful buildings, and if they had a chance of clearing away certain areas and grouping the best buildings there would be no capital in Europe that could compete with the Metropolis. It was necessary to improve the line of access between our important buildings. If new roads could be opened up with that object in view they would be doing something which was more practical and more easily attained than the mere driving of a huge thoroughfare through the heart of the Metropolis. He asked whether it was possible to have an authority in London which would study tradition and support a continuation of architectural principles ; which would watch perpetually and consistently street improvements so as to have the means of obtaining relief when it was most needed and when it could be done economically ? He thought they had that body in the London County Council, though he was prepared to hear that others differed with him in this opinion. He could not help thinking that a body with an architectural staff and possessing statutory powers and a certain control over existing thoroughfares was the authority which ought to safeguard those interests. The improvement of the London County Council was very necessary and important, and he would like to suggest that their improvement in architectural matters was wholly in the hands of the members of the Institute, and if he Institute would take a wise line with regard to public action they would be doing more good than adopting a critical attitude.

Mr. E. W. HUDSON agreed with many of the proposals in Mr. Waterhouse's paper, and suggested the improvement of the Metropolis by the formation of elliptical avenues.

Mr. W. WOODWARD said they must arrive at the conclusion that there was no possibility of getting new thoroughfares in London to-day, but he suggested more advantage might be taken of the existing thoroughfares than was done.

Sir ASTON WEBB, R.A., also supported the vote of thanks.

Mr. H. D. SEARLES-WOOD moved the following resolution :—"That the Council present a memorial to the Government urging that as the Royal Commission on London Traffic reports it to be necessary to open new thoroughfares and communications, it is most desirable, in order to preserve the architecture of London, that the profession of architecture should either be represented on the Board, or that a professional adviser or advisers should be employed by the Board that will be formed to deal with the laying out of the new thoroughfares."

Mr. JOHN SLATER seconded the motion, which was carried unanimously.

DAMASCENING AND THE INLAYING AND BLENDING OF METALS.*

THE ancient and beautiful art of damascening, which is probably due to the East, consists of inlaying one metal with another metal or metals, usually silver or gold, upon iron or steel in the form of wire or strip, into recesses or lines, which are dovetailed or undercut—that is, wider at the base than on the surface—with a specially-constructed tool, the whole surface being finally smoothed and polished. When broad bands of metal have to be laid on, the edges of the band are grooved or incised, saving much labour and economising the precious metal to be inlaid.

Damascus sword blades must not be confused with damascening, which is a distinct art. Their peculiar variegated watered appearance, and the method by which the structure is produced, has been a matter of speculation. Dr. Percy, in his book on the "Metallurgy of Iron and Steel," explains it thus :—

"The damasked portion is due to the difference in colouration, resulting from the action of acids on iron and steel, the surface of the former being left with a metallic tissue, and that of the latter being left coated with a black firmly-adherent carbonaceous residue. By suitably piling together bars of iron and steel, welding them, and drawing them out under the hammer or otherwise, patterns of various kinds may be produced, just as it does in the case of glass, by heating together variously-coloured pieces of glass and drawing them out into rods."

In the thirteenth century Theophilus the Monk, when writing on artistic handicrafts, described the process of damascening; in Persia, China and Japan it was practised before that period with most artistic results. In the British Museum can be seen the remains of the celebrated Etruscan car embellished with fine examples of damascening.

This rich method of surface ornamentation, which can also be very delicate in design, was practised in the East long before it was introduced into Europe from Damascus, the chief city of the Moors. During the sixteenth century, in the time of Cellini, it was freely practised in Italy, being specially employed for the decoration of weapons and armour. The Arab work done by the Moslems in Northern India is some of the most beautiful. In Kashmir, vessels of copper and brass are very effectively inlaid with tin, an art which, like many decorative arts, appears to have originated in Persia. The Arabic-speaking people, the Chinese and the Japanese are fortunate in possessing a system of written characters which are beautiful in themselves and readily lend themselves to damascening work. During the Dark Ages the art appears to have been lost, except for some church gates at Rome, made in 1070 at Constantinople.

I will now show you some lantern-slides illustrative of Indian, Italian, Spanish, Saracenic, Persian and Japanese damascening. The first is a specimen of Italian work, about 1550, made for the royal family of Savoy, and is a mirror of burnished metal, in a stand of steel damascened in gold and silver. The frame is of architectural design, supported on scrolls, which rest on a square box, with scrolled angles and feet. The whole is covered with medallions of classical subjects, arabesque, cartouche, &c., in gold and silver. At the back of the mirror is a religious subject, with "The Saviour and the Angels" in niches; the whole is surmounted by a group of Venuses and Cupids. The next is a Spanish gauntlet, sixteenth century, damascened with military trophies, palm branches and wreaths in gold, and with foliage; the knots are gold and silver. The following slide is a Japanese dish, inlaid in various diapers in silver, and a border of leaves and grapes. In the centre is the medallion head of a man holding his hands to his cheeks, surmounted by a similar border, from which six petals diverge, inlaid with flowers in gold and silver. The next illustration is probably the work of Saracenic craftsmen settled in Venice; the bronze salver is engraved and damascened with gold and silver, and the interstices filled with black lac; in the centre are the enamelled arms of the family of Verona. Now follows a specimen of Indian work; the ewer is damascened on silver and gold, dated 1400 A.D. The metal on which the gold and silver is inlaid is a zinc alloy, blackened by pickling in a solution or applying, in a pasty condition, of chloride of ammonia, common salt, nitre and sulphate of copper. The alloy employed by different craftsmen is found to vary considerably; the following is a typical analysis :—

Lead	1.437
Tin	trace.
Iron	.039
Copper	6.905
Zinc by difference	91.619
	100

The next illustration is another specimen of Indian work, about 1770, and is the base of a water-pipe or hookah, damascened with gold and silver. The final illustration is a Persian shield, damascened with gold and silver, chased with flowers, animals and an inscription.

Niello.

I will now pass on to niello, which is similar to damascening, only inasmuch as the metal to be ornamented has to be engraved, it is filled with a metallic sulphide instead of being beaten in metal. The process consists of incising lines on the metal as in copperplate engraving, and filling them with a compound of sulphur, silver, copper, lead and borax. In this way very effective results are obtained, the finished work having the appearance of a drawing in black on a metal plate. The word "niello" is derived from "niger," and refers to the colour of the enamel. The modern copper or brass doorplate, filled with black enamel, is really niellowork.

Our knowledge of the process and materials employed in niellowork is largely derived from Eraclius, the Roman, a writer of about the eleventh century. The goldsmiths of Florence, in the middle of the fifteenth century, were in the habit of ornamenting their works by means of engravings, after which they filled up the patterns produced with a black enamel, made of silver, lead and sulphur, to make the design more visible by the contrast of enamel and metal.

The monk Theophilus, already referred to, also mentions niellowork. His recipe is silver one part, copper one-third part and lead one-sixth part, all to be fused together with yellow sulphur by melting in a crucible, the composition, after cooling, being powdered and applied to the metal at a low heat, with a flux of parachas gum, which was probably borax. The procedure was as follows:—The design, having been cut with a sharp graving tool on the smooth surface of the metal, which was usually silver, but occasionally gold, a solution of borax, to act as a flux, was brushed over the metal plate and thoroughly worked into its incised lines. The powdered sulphide compound was then shaken on to the plate so as to completely cover all the engraved pattern. The plate was then carefully heated over a charcoal fire and fresh compound added, as the powder fused, upon any defective places. When the powder had become thoroughly liquid so as to fill all the lines, the plate was allowed to cool and the whole surface was scraped to remove the superfluous niello, leaving only what had sunk into and filled up the engraved pattern. Last of all, the niello plate was very highly polished till it presented the appearance of a smooth metal surface enriched with a delicate design in fine grey-black lines. This process was chiefly used for silverwork on account of the vivid contrast between the whiteness of the silver and the darkness of the niello. As the slightest scratch upon the metal received the niello and became a distinct black line, ornament of the most minute and refined description is easily produced.

Niellowork is responsible for having originated plate-engraving. The artist or craftsman, when executing a piece of niellowork, was in the habit of making a sulphur cast of his niello in progress on a matrix of fine clay, and filling in the lines in the sulphur with lamp black, thus enabling him to judge of the effect obtained by his engraving process. At a later period it was discovered that a proof could be taken with damp paper, by filling the engraved lines with ink and wiping it off the surface of the engraved plate, sufficient pressure being applied to make the paper enter the lines containing the ink. This was the beginning of plate-printing, but the value of the discovery was not realised until some considerable time afterwards. It was merely employed as a convenient method by niello engravers of proving their work and saving the double process of making a sulphur cast.

Statuettes, fibulæ and the centre of silver dishes decorated with niellowork, combined with part-gilding, were apparently in considerable favour during the first few centuries of the Christian era. In 1793 some beautiful specimens of niellowork were found near the Esquiline Gate, belonging to a Roman lady. In the time of King Alfred there appear to have been a number of gold orna-

* A paper by Sherard Cowper-Coles, read at a meeting of the Applied Art Section of the Society of Arts.

Digitized by Google

ments decorated with niello.* The art of niellowork is still kept up in Siam, Turkey, Burma and Italy, but is most largely practised in the Caucasus for decorating all classes of metal objects. I will now show you a lantern slide of a silver and gilt niello cup, engraved with figures, roses and festoons, made in Russia in 1792; the snuffers in the foreground are French damascened work about 1700; they are blued steel, inlaid with gold.

Processes.

There are other minor processes employed for inlaying and decorating metals, which I will briefly describe :—

The ether process consists in using a composition of sulphuric ether and nitro muriate of gold, which are mixed together, the ether by degrees becoming impregnated with nearly the whole of the gold, and retaining it for a long time in solution. The ether thus charged is painted on the surface of the ornament with a camel's hair brush. After evaporating the ether by heating to a temperature of 150 degs. F., the gold is finally brightened with a burnisher. The coating thus obtained is very thin, and is only suitable for decorating articles not subjected to wear.

Parcel or close plating consists of onlaying flat pieces of metal on the surface to be decorated, in much the same way as veneering, the metal being attached by means of a low melting-point solder. A modification of this process consists of cutting out the same patterns in two different coloured metals, and interposing the portions removed.

A process occasionally employed for decorating metallic surfaces consists of engraving or etching on a flat surface the desired design, and then running into the sunken portion molten metal. This process is very costly, and is only applicable to flat surfaces.

In the electrical process those parts of the metal which it is intended should not be inlaid are stopped off with a suitable composition for resisting, such as a varnish or beeswax, and gold or silver or other metal or metals are deposited by the usual method of electro-deposition, the plate having been previously etched if the pattern is to be level or flush with the surface decorated, or the pattern or design can be raised by omitting the etching process. The illustration now thrown on the screen is a zinc plate, etched and inlaid with copper by electro-deposition, and the next is a copper plate, with a raised design in zinc electro-deposited.

In the lead process a design or picture is etched by means of acids, either by hand or by photography, on a thin plate of steel or other metal. The etched side of the plate is then brought into contact with molten lead, and when the play of colours produced on the plain side results in the desired effect, the plate is immersed in cold water or oil. In this way, heat having been conducted through the various portions of the plate at rates inversely proportional to their thickness, yields colour due to different thickness of oxide on the plain surface, which represents the etched design on the reverse side. By such a process beautiful colour effects can be obtained, but the result is not permanent. Some specimens of this work will be found on the table.

This brief description of the allied processes would not be complete without a reference to tarsia or wood mosaics, or marqueterie, which is often combined with metallic inlaywork. Tarsiawork is the same as damascening in principle, but applied to wood—that is, wire is hammered into grooves cut in the wood to receive them. In a recent development in tarsiaturan work wood veneer is cut out corresponding to that portion of the pattern that is ultimately to be represented by metallic inlay, and fastened down on to a sheet of metal provided with teeth for holding purposes. The back of the sheet is protected with varnish and the whole is placed into a copper electro-depositing solution. A deposit is thus obtained on the bare metal, which eventually becomes flush with the surface of the surrounding veneer. Buhlwork is also similar in many respects, but is chiefly applied to inlaying of brass and tortoiseshell. The brass is laid on to a wood base in the form of strips, and the tortoiseshell inlaid between.

New Process of Inlaying and Ornamenting Metallic Surfaces.

I will now describe to you a new process, which is based on a discovery made by myself about five years ago, when conducting some experiments on the annealing of iron, viz. that metals in a fine state of division, subjected to a temperature several hundred degrees below their melting-point, in contact with a solid metal, volatilise, or give off the vapour, that is in the form of a powder, when heated, which condenses on the solid metal placed in the powdered metal.

This discovery has recently been turned to account for the inlaying and ornamenting of metallic surfaces, enabling results to be obtained similar to damascening, but with the additional advantage that there is no risk of the metals finally separating, as is often the case in damascening, as will have been observed in some of the illustrations shown to-night.

The new process also enables a variety of effects to be obtained, and a number of metals to be blended together which has hitherto been impossible, and alloys of many colours and tints to be obtained in the one operation of baking. The thickness and depth to which the metals are to be inlaid and onlaid can be controlled at the will of the operator.

The *modus operandi* of the process consists in coating the article with a stopping-off composition, those portions which are to be inlaid being left exposed. The composition is about the consistency of cheese, so that it can readily be cut with a knife; the design is traced with a sharp edged tool, and those portions to be removed are lifted and cleared away. The object thus prepared is placed in an iron box containing the metal which is to be inlaid in a powdered form. If zinc is the metal to be inlaid, zinc dust is the powder that will be employed, which is a product obtained direct from the zinc-smelting furnaces. The iron box holding the powdered metal and the objects to be ornamented is then placed in a suitable baking oven and heated to a temperature many degrees below the melting-point of zinc, 686 degs. Fahr., so that the temperature to which the zinc dust is heated is about 500 degs. Fahr. My assistant, Mr. Gardner, will now take four small copper plates prepared with a scroll design and place them in an iron box, and fill it with zinc powder, and heat the box in a small gas furnace, matters being so arranged that the operation of inlaying will occupy about ten minutes, by which time I shall have concluded this paper. He will then open the box and show you the results obtained. The time and temperature is regulated according to the thickness and depth of the inlaying which is required to be obtained, and varies from a few minutes to several hours. A little experience soon teaches the operator the best time and temperature necessary for obtaining given results with different metals. When the article has been baked for a sufficient time the box, after preferably being allowed to cool, is then opened and the article removed and brushed with a stiff brush, to remove the stopping-off composition which has become loosened during the process of baking; the process of stopping-off and baking can be repeated several times when it is desired to inlay two or more metals. It will, no doubt, have occurred to many of you that the metal box containing the powdered metal will rapidly become thickly encrusted with metal, but this is found not to be the case, the reason being that the metal box is hotter than the powdered metal. A useful type of furnace or baking oven for general work, such as panels, trays, &c., consists of a wrought-iron box 8 feet long and 4 feet broad, 1 foot deep. The box is half filled with zinc dust, and the articles to be baked are placed in the zinc dust and well covered over with it, a lid placed on the top of the box and over this an iron framework, carrying fire-bricks and with a small central flue to draw the heat from the burners up the sides of the box and over the top, to insure even heating. Such a furnace can be constructed at a cost of about 30*l.* complete. Damascening produced by this method is of a more permanent character than the older method. There is no possibility of separation, as the metals are alloyed together and the inlay can be carried to any depth, and it is found that the inlaying metal, in the case of zinc, is very much harder than the brass or copper into which it is inlaid.

A feature of considerable importance is that a variety of colours and alloys can be obtained in the one operation of baking. I will take for an example a copper tray which it is desired to inlay with zinc, and at the same time to convert certain portions of the copper into brass. This can be done by varying the thickness of the stopping-off composition, and by baking at a somewhat higher temperature than would otherwise be employed. The result is that certain portions can be converted into golden-coloured brass, the other portions remaining unalloyed copper. In the example taken, certain portions of the foliage and birds are a combination

* Those who wish for further information regarding niellowork should read a paper delivered before this Society by Mr. Cyril Davenport. (*Journal*, vol. 48, p. 245.)

Digitized by Google

of brass and copper. Another is a hammered copper dish, inlaid with zinc, in which a different effect is obtained, as the hammer marks continue to show in the zinc inlay. Also is a copper table top inlaid with zinc; in this case the zinc inlay is smooth and copper-hammer marked, and a gong inlaid with zinc, surrounded with a line of brass. Another example is a copper dish inlaid and onlaid with zinc, the zinc being raised as much as one-sixteenth of an inch above the surface of the copper. An iron box is inlaid with zinc and enamel. The whole of the surface of an alms-dish was burnt with zinc, and the pattern etched down to the different alloys formed, intermediate between the zinc and brass, so as to obtain a variety of colours. A book-cover is done in a similar manner, with the exception that the outline of the pattern has been chased and the whole of the design etched down to the copper. A copper liqueur tray is inlaid with zinc and brass, the zinc pattern being considerably raised.

Without exception, the samples I have shown you by means of the lantern are two metals giving a decided contrast, such as copper and zinc, as the more subtle contrasts between zinc, tin, aluminium, nickel and cobalt, and similar coloured metals are difficult to photograph, but a number of specimens will be found on the table.

The new process is not confined to flat surfaces, but can be readily applied to raised surfaces. This process is also adaptable to the finest work as well as very bold work.

This new process of burning in and blending metals enables a very beautiful colour effect to be obtained, with great subtlety of colour; the colour effects ranging from silver-white zinc to yellow brass and bronzes of various shades, graduating to red copper and autumnal shades of yellows and golden browns.

A great charm about this new process of inlaying metals, and one that is unique, is that the inlay has not the sharp line of demarcation, as is essential to damascening, but a soft transition from the inlaid metal to the surrounding metal. For instance, in the case of inlaying zinc into copper, it will be observed that the zinc is surrounded by a band or halo of a golden-coloured alloy.

This process of inlaying or damascening is not confined to zinc and copper, but has been successfully applied to such metals as nickel, cobalt, antimony and aluminium. Some specimens of these metals, inlaid one with another, will be found on the table.

In conclusion, I venture to express the hope that this new process of inlaying and blending metals in its more advanced state may be the means of reviving in England the beautiful art of damascening and the inlaying and blending of metals, and bring damascened metalwork within the scope of all lovers of the artistic, and that it may become an industry of villages, to which it readily lends itself. The old method of damascening is essentially an Eastern craft, dependent as it is on skilled, cheap and patient labour. The process which I have described to you to-night is capable of producing inlaid work, both of elaborate and delicate designs, in a few hours, yet each piece produced has its own individuality, and truly records the touches of the artist. I should also like, before closing, to thank those who have helped me in the preparation and production of the various specimens which are exhibited to-night.

SEA EROSION AND COAST PROTECTION.

A CONGRESS was held last week at Eastbourne of the South-Eastern Union of Scientific Societies. Among the papers read was one on "Sea Erosion and Coast Protection," by Mr. Edward A. Martin, F.G.S. The author, says the *Sussex Daily News*, prefaced his remarks by recalling the public attention awakened in the subject during the last few years. The movement, he went on to say, had in view possible assistance from the National Exchequer in the direction of meeting the cost which has fallen on local authorities, and of seeking relief from the necessity of having to pay for what is held by them to be a matter of national interest. In this connection it was, he stated, instructive to note that in the well-known case of the Attorney-General *v.* Tomline it was held that it was the duty of the Crown "to protect the realm from erosion by the sea by maintaining such national barriers as existed against it," and it was also pointed out that the removal of shingle from Spurn Head was prohibited by the Board of Trade.

Almost among those parts of the coast which have suffered inroads of the sea, Mr. Martin placed the coast stretching from near Flamborough Head in Yorkshire to the mouth of the Thames. Next in importance so far as loss by denudation is concerned, he took the line of coast stretching from the North Foreland to Folkestone, consisting of chalk with superimposed beds of Eocene age at Pegwell Bay. With this he coupled the coast between Eastbourne and Brighton, also consisting of chalk cliffs, but with important beds therein of Eocene age, as at Seaford and Newhaven, and with post-glacial beds on the eastern side of Brighton. To the west of Brighton the trend of the chalk hills inland has exposed the tertiaries of West Sussex to the sea, and the existence of the Isle of Wight as an island is, on the face of it, evidence of loss by erosion of the Eocene and Oligocene beds which were at one time continuous across the Solent and Spithead. On the western coasts history recorded less waste by sea erosion, in consequence of the harder nature of the strata exposed.

After considering the progress of erosion as shown in the historical period, Mr. Martin submitted that for evidence of loss of land on the western coast by the incoming of the sea during historical times they must look to subsidence as the cause, except in those places where the line of coast exposed was made up of glacial or alluvial clays and drift; but of sea erosion on the eastern and south-eastern coasts as attributable to subsidence he had been unable to trace any evidence. The rate at which the coast was eroded varied considerably according to the nature of the material of the cliffs; at two spots even in close proximity to one another the rates might vary. In a special table showing estimates of rates of erosion, Mr. Martin included the following figures relating to the Sussex coast:—

"Eastbourne, Splash Point, 'nearly a furlong' from 1717 to 1841; Round House, 3 acres in ten years to 1887; east of Circular Redoubt, 238 feet in forty-nine years.

"Worthing, 70 feet in twelve months; between Selsea Bill and Chichester Harbour, 15 feet to 20 feet in a year; between Littlehampton and Bognor, 4 feet to 5 feet a year."

Leaving aside the consideration of falls of cliff due entirely to want of natural drainage and other aerial agencies, cliff erosion arose from waves breaking over the sea-shore and thus removing fallen detritus, and when raised on the shoulders of the tidal wave pounding the cliffs like a battering ram, portions broken off being in turn utilised as a means of further assault. The flow of shingle along the southern coast was in the direction of the prevailing wind—south-west; and wherever groynes had been erected on this coast the western sides had been the first to be filled with beach, the supply, practically unlimited, being from the west. All efforts at coast protection had been devoted to the invention of the best means of arresting some portion of the supply, in order to create a substantial strand of beach, this being acknowledged to be the best protection which could be afforded to a line of cliffs. But each town which had in turn pushed groynes out into the sea had arrested a part of the supply, and each had in turn starved the coast line for some miles to the east of it until its own groynes had become filled on their windward sides. The same supply had been a fruitful source of expense to various harbour authorities in keeping open a channel to the sea.

Seventy years ago the outfall of Shoreham Harbour, or rather of the river Adur, was at Aldrington, a long spit of beach parallel to the coast having been formed, while the river pursued its way four miles along the coast before entering the sea. A new outfall was subsequently made near Shoreham, and a pier, which was constructed in 1874 on the west of the outfall, stopped the flow of shingle into the river channel until now there is a bank of shingle over a quarter of a mile wide. But Brighton suffered through this appropriation of the shingle, as well as by the protective measures which were taken to preserve the spit of land lying between the "Basin" and the sea at Aldrington, on which, in 1871, the Brighton and Hove Gasworks had been built. In the course of time the requirements of these works were met and the supply flowed on again. Hove has since trapped as much as she needs; Brighton has pushed her esplanade further out into the sea (the Aquarium is built on reclaimed foreshore), and new works, in the shape of walls and groynes, now extend as far as Black Rock, Kemp Town. Here they come to an end, and the sea sweeps round on to the unprotected cliffs, which for a distance of about half a mile consist unfortunately only in part of chalk, the upper three-fourths being of post-glacial rubble, which is acted upon very rapidly by atmospheric agencies. The scour of the waves at high tide loosens the chalk platform on which the rubble-drift rests, and marine and subaerial denudation combine [illegible] upon

the defenceless cliff. Again, at Newhaven the sea-wall and other works on the west side of the harbour entrance have resulted in the accumulation of a great amount of shingle and has prevented the beach so arrested from filling up the harbour channel. Here, again, the river Ouse had in former years been turned to the east by the westward flowing shingle until it made its entrance into the sea at Seaford. Those who know that town now scarcely realise this important fact. Another instance of the kind is found in the west pier of the harbour at Folkestone, which was built in 1856 to prevent the easterly drift of the shingle across the mouth of the harbour, the bar of which was dry at low tide. In seventeen years the beach advanced on the westward side 120 feet for a length of 500 feet. The result of this pier and subsequent extensions has resulted in a wide stretch of level beach, on which pleasure gardens, &c., have been constructed, the whole area having been reclaimed from the sea.

In order to protect coasts from erosion they must imitate nature as far as possible, and discover what are the means which she has employed in those places where sea erosion was comparatively unknown. The chief protection was a sloping shingle beach, and the principle of groyning was to intercept the flow of gravel after having ascertained the direction whence it came. Thirty years ago the favourite form of groyne was of wood and of great height, arresting enormous quantities of gravel, but heaped all on one side. For many years these groynes, as, for instance, those in front of the Brighton Aquarium, exhibited a precipitous face to the east with a drop of as much as 20 feet. This form had now almost entirely been discarded in favour of the low type, formed of concrete, so that as the windward side became filled up the gravel fell over on to the other side and filled that up. The tendency was in these cases for the groynes to become completely hidden in a few years by an equable deposition on both sides. The attempt to attract a beach in front of the sea-wall at Hove by means of groynes set diagonally to the south-east instead of at right angles to the shore was a failure, and the use of sloping groynes is not now recommended unless a terminal portion be added at right angles to the shore. Acting on the principle that the shallowing of a shore tends to cause the tidal current to drop its burden, 20,000 tons of shingle, dredged from the mouth of Shoreham harbour, where it was very undesirable, were emptied from hopper barges into the sea in front of the Hove lawns, and this artificial accumulation arrested much of the westward flowing gravel, besides acting as the nuclei around which shingle has since accumulated. Much of it has in the course of time been washed up on shore, and no fears are now felt as to the safety of the sea wall. This artificial dumping of material might, he thought, be utilised more often in the future.

The all-important question which had of late been raised was as to who should bear the expense of protecting the coast. Local authorities had been at great expense to protect the mile or two of coast with which they were more particularly concerned, and although the outcry was that the cost had fallen very hardly on small municipalities, the chief practical question was the protection of lines of coast but sparsely populated—rural sea frontages, as they might be called, in contradistinction to urban sea frontages. It must be borne in mind that the works which had been reared by urban authorities had done much in the way of increasing the erosion of rural sea frontages; and any expenditure which the State might undertake in this direction should be devoted for the most part to the long stretches of coast away from the towns. The actual cost of protection varied considerably, and of course where, as in the case of Hove in 1884, a wide strip of foreshore, in this case 30 yards, was reclaimed from the sea, the works necessarily might reach a very high figure. At Hove the protective works along a frontage of 720 yards, including groynes, granite-faced sea wall and the artificial dumping already referred to, cost upwards of 60,000*l.*, or 85*l.* per lineal yard. On the other hand it had been estimated that a long strip of frontage of wasting cliffs not requiring a sea wall might by a series of wooden groynes be protected at a cost of 1*l.* 10s. per lineal yard of coast. The subject was one which must come to the front more and more in the future, and the taxpayer would no doubt have a word to say ere the public exchequer was drawn upon to protect land in which he had no direct pecuniary interest.

Mr. Edmund Woodthorpe, M.A., F.R.I.B.A., architect and surveyor, of 1 Circus Place, Finsbury Square, E.C., left property to the value of 10,744*l.*

THE OLD CITY WALL OF EDINBURGH.

THE town clerk of Edinburgh has prepared a report, on the instruction of the treasurer's committee of the Town Council, with reference to the ownership of the wall on the north side of George Heriot's hospital grounds. The question was raised, says the *Scotsman*, by a representation from the governors of Heriot's Trust that they contemplated erecting drawing classrooms on the north side of their ground, and they asked the Town Council to allow them to use the north wall for the support of the proposed buildings, which were described as "mutual." At a later stage the Heriot governors claimed proprietary rights over the wall, and insisting that the Council should admit the validity of their claim to ownership, declined to pay compensation to the Corporation. The committee of the Town Council maintained that the wall belonged to the Corporation, and that the Heriot governors could not build upon it without their consent. The town clerk, in his report, points out that the wall is part of the old Flodden wall which was built for the protection of the city after the battle of Flodden in 1513. That wall and its site belong to the Corporation as part of the property held by them under their royal charters. In many places portions of the original are still standing, and although at this particular part the wall was rebuilt by the Corporation in 1889, it was rebuilt on the same site. Down to the year 1618 the land which now forms Heriot hospital grounds was part of the estate of Inverleith. In the year mentioned, however, the city purchased from Sir George Touris, of Inverleith, for 9,000 merks Scots, "the ten acres of land, part of Hieriggs." In the disposition by Sir George to the Corporation, the lands bought by the city were described as bounded by "the Town Wall of the said Burgh from the turn and west round of the said wall to the Society Port *upon the north*." Shortly after the purchase was concluded the Council gave instructions for the erection of a dyke round the land, and one John Telfer, a contractor, executed this work for the Corporation in 1620. The town clerk points out that "the title of the Corporation to the ten acres of Hieriggs being thus bounded by the old Town Wall no acts of their successors in the title could acquire by prescription ownership of any part of that wall outside the limits of the boundary titles." In 1627 the Town Council sold a portion of their lands at Hieriggs to George Heriot's trustees, who described their purchase as having been "lately acquired by the guid town from Sir George Touris, of Inverleith, knicht, and the thereefter invironit with a wall and incorporat with the rest of the said burgh." The portion so to be sold was fixed at 8½ acres out of the 10 acres acquired by the city. The ground purchased was to be held of the "guid town in free blench for payment of a penny when asked, and a sum of 7,650 merks by way of grassum." Presumably the wall was included in the purchase, and the governors of Heriot's Trust, Mr. Hunter states, may have subsequently from time to time repaired or even renewed it, but that could not affect the ownership of the city wall outside their boundary. Early in the "forties" of the seventeenth century the governors of Heriot's Trust purchased the properties on the south side of the Grassmarket in order to make a passage way from the Grassmarket to their lands. To make that passage of any use they had to obtain permission for an opening in the city wall, and for this they applied to the Town Council, who, on April 24, 1644, authorised the treasurer of Heriots' Hospital "to demolish so much of the town wall lying benorth Heriot's Hospital to make an entry to the hospital grounds according to the design shown to the Council." By that time, Mr. Hunter says in his report, no one disputed that the ownership of the wall was with the Corporation or suggested that it was included in the Heriot feu.

The hospital lands were occupied by Cromwell's troops after the battle of Dunbar in 1650 down to 1658, so that it was not until the latter year that the lands were available for the hospital purposes. In 1888 it was found necessary to rebuild the old city wall. At that time it was thought that the Heriot garden wall stood upon a foundation afforded by the inner part of the city wall; but when the Heriot wall was removed it was found to have been standing on Heriot ground, clear of the city wall by some inches. That, says Mr. Hunter, corroborates the statement that the garden or boundary wall was built entirely on Heriot ground clear of the old city wall. Mr. Hunter relates that when the Town Council described themselves as proprietors of the wall in the petition granted by the Dean of Guild Court for the rebuilding of the wall the Governors of Heriot's Trust acquiesced in the petitioners' statement. They paid to the city 134*l.* 10s. 1*d.*, being half the cost of the rebuilding opera-

Digitized by Google

tions; but, says Mr. Hunter, "it was no doubt worth their while," for they obtained the city's permission to re-erect their own wall—the inner or garden wall—upon the top of the rebuilt city wall. Mr. Hunter suggests, if the Governors have since learned that they can claim ownership of the wall, "they may be expected to offer to repay to the Corporation, with interest, the 134*l.* 10*s.* 1*d.*, being the half cost which the latter paid in 1889, under what the Governors now apparently regard as error."

In concluding his report, the town clerk says:—"If the erection of the wall is to be regarded as a material point, the original erection of the Flodden wall, and its rebuilding by the Corporation in 1889 points to the Corporation as owners; whilst the erection, or renewal, of the garden wall by the Governors inside their ground in 1814, separate from the Flodden wall, and its removal by them in 1888, points to the Governors as being its owners. A reference in an old minute to the rebuilding of a town wall, which is not identified, and which may either have been the predecessor of the wall of 1814, or more probably be situated elsewhere, is not sufficient to discharge the onus upon the Governors when they undertake to show how and when the Corporation transferred to them the property in the city wall and its site."

PROTECTION OF THEATRES.

THE following report of a special committee of the National Fire Protection Association of the United States on the subject of construction and equipment of theatres as protection against the fire hazard has been issued:—

The specifications for steel and asbestos theatre curtain which we include are additional matter, our thought being that steel curtains similar to those required in Chicago should be the standard of this Association, relegating the asbestos curtain to second place as a sub-standard curtain. We intend eventually to submit for adoption by the Association a separate standard for openings in roof over stage to provide for escape of smoke. With these explanations, our specifications are as follows:—

Every such building shall have at least one front on the street, and in such front there shall be suitable means of entrance and exit for the audience.

In addition to the aforesaid entrances and exits on the street, there shall be reserved for service in case of an emergency an open court or space on the side not bordering on the street, where said building is located on a corner lot, and on both sides of said building where there is but one frontage on the street. The width of such open court or courts shall not be less than 7 feet where the seating capacity does not exceed 1,000 people, exceeding 1,000 and not more than 1,800 people 8 feet in width, and exceeding 1,800 people 10 feet in width. Said open court or courts shall begin on a line with or near proscenium wall, and shall extend the length of the auditorium proper, to or near the wall separating the same from the entrance lobby or vestibule.

A separate and distinct corridor shall continue to the street from each open court, through such superstructure as may be built on the street side of the auditorium, with continuous walls of brick or fireproof materials on each side of the entire length of said corridor or corridors, and the ceiling and floors shall be fireproof. Said corridor or corridors shall not be reduced in width to more than 3 feet less than the width of the open court or courts, and there shall be no projection in the same; the outer openings to be provided with doors or gates opening toward the street. During the performance the doors or gates in the corridors shall be kept open by proper fastenings, at other times they may be closed and fastened by movable bolts or latches.

When located on a corner lot that portion of the premises bordering on the side street and not required for the uses of the theatre may, if such portion be of fireproof construction and not more than 25 feet average width, be used for offices, stores or apartments, provided the walls separating this portion from the theatre proper are carried up solidly to and through the roof and that an exit is provided for the theatre on each tier, equal to the combined width of exits opening on opposite sides in each tier, communicating with balconies and staircases leading to the street in the manner provided elsewhere in this section.

No workshop, storage or general property-room shall be allowed above the auditorium or stage, or under the same, or in any of the fly galleries, unless all of such rooms or shops are located in the rear of or at the side of the stage, and in such cases they shall be separated from the stage by a brick wall not less than 12 inches in thickness, and the openings leading into said portions shall have self-closing standard fire doors.

No portion of any building hereafter erected or altered, used or intended to be used for theatrical or other purposes in this section specified, shall be occupied or used as a hotel, boarding or lodging-house, factory, workshop or manufactory, or for storage purposes, except as may be hereafter specially provided for. Said restriction relates not only to that portion of the building which contains the auditorium and the stage, but applies also to the entire structure in conjunction therewith.

Interior walls built of fireproof materials shall separate the auditorium from the entrance vestibule, and from any room or rooms over the same; also from any lobbies, corridors, refreshment or other rooms. And in all such walls the window and door frames and all sash and doors shall be fireproof, the window frames and sash shall be of metal of standard construction, and the sash made stationary and glazed with wired glass not less than ¼-inch in thickness, and each pane or unit measuring not more than 24 by 30 inches. The doors shall be made to close automatically, and be fireproof, of standard pattern and make in every respect.

All staircases for the use of the audience shall be enclosed with walls of brick or of fireproof materials in the storeys through which they pass, and the openings to said staircases from each tier shall be the full width of staircase. No door shall open immediately upon a flight of stairs, but a landing at least the width of the door shall be provided between such stairs and such door. A firewall built of brick, not less than 12 inches in any portion of same, shall separate the auditorium from the stage, and the same shall extend at least 4 feet above the stage roof or the auditorium roof, if the latter be the higher, and shall be coped. Above the proscenium opening there shall be an iron girder of sufficient strength to safely support the load above, and the same shall be covered with fireproof material not less than 4 inches in thickness.

The proscenium opening shall be provided with a fireproof metal curtain or a curtain of asbestos, or other fireproof material approved by the underwriters having jurisdiction, overlapping the brick proscenium wall at each side not less than 12 inches, and sliding vertically at each side within iron grooves or channels to a depth of not less than 12 inches, said grooves or channels to be securely bolted to the brick wall and extend to a height of not less than 3 feet above the top of the curtain when raised to its full limit. Said fireproof curtain shall be raised at the commencement of each performance, lowered between each act and lowered at the close of said performance, and be operated by approved machinery for that purpose. If the proscenium curtain be of asbestos, that material shall be reinforced with wire or wire spun in the asbestos, and at the bottom of the curtain shall be placed a rigid metallic rod or bar of proper weight, securely fastened to the curtain and covered over with like material as the curtain itself, to carry down the curtain by the weight of the said rod or bar when released. The excess weight of the curtain is to be overcome by a check-rope of cotton or hemp, extending to the floor on both sides of the stage, so that the cutting or burning of which will release the curtain and the same will then descend at its normal rate of speed. The proscenium curtain shall be placed at the nearest point at least 3 feet distant from the footlights.

No doorway or opening through the proscenium wall from the auditorium shall be allowed above the level of the first floor, and such first-floor openings shall have self-closing standard fire doors at each side of the wall, and openings, if any, below the stage shall each have a self-closing standard fire door, and all of the said doors shall be hung so as to be opened from either side of the wall at all times.

There shall be provided over the stage metal skylights, of an area or combined area of at least one-eighth of the area of the said stage, fitted with rolling sash and glazed with glass not exceeding ⅛-inch thick, and each pane thereof measuring not less than 300 square inches.

The rolling sash shall be fitted with brass wheels not less than 2½ inches in diameter, and latter shall roll on brass tracks extending the entire length of the sash. The portion of the tracks extending from the edge of the curb of the skylight to the end of the incline may be made of iron. These skylights shall be set on curbs, so that the lowest portion of the tracks upon which they slide shall be not less than 12 inche above the roof. The whole of which sky-

Digitized by Google

light shall be so constructed as to open instantly on the cutting or burning of a hempen cord, which shall be arranged to hold said skylights closed, or some other equally simple approved automatic device for opening them may be provided. Immediately underneath the glass of said skylights there shall be wire netting, but wire glass shall not be used in lieu of this requirement.

The roof over the stage shall be provided with a shaft of galvanised iron or other fireproof material approved by underwriters having jurisdiction, extending from the ceiling line up through and at least 4 feet above the roof, and have a raised cover at the top for the escape of smoke. The least inside diameter, or the least horizontal measurement, if the shaft be of other shape than circular, shall be 48 inches. At the bottom of this shaft, on a plane with the ceiling, shall be a galvanised sheet-iron door in two parts, each part separately hinged and kept closed by fusible links, so that in case of fire the doors will instantly open downwards by their own weight.

All that portion of the stage not comprised in the working of scenery, traps and other mechanical apparatus, for the presentation of a scene, usually equal to the width of the proscenium opening, shall be built of iron or steel beams filled in between with fireproof material, and all girders for the support of said beams shall be of wrought-iron or rolled steel.

The fly-galleries and the tie-galleries entire, including pin-rails, shall be constructed of iron or steel, and the floors of said galleries shall be composed of iron or steel beams, filled in with fireproof materials, and no wood boards or sleepers shall be used as covering over beams, but the said floors shall be entirely fireproof. The painters' bridge shall be constructed of iron or steel.

All stage scenery, curtains and decorations made of combustible material, and all woodwork on or about the stage, shall be painted or saturated with some non-combustible material, or otherwise rendered non-flammable. And the finishing coats of paint applied to all woodwork throughout the entire building shall be of such kind as will resist fire to the satisfaction of the underwriters having jurisdiction.

The roof over the auditorium and the entire main floor of the auditorium and vestibule, also the entire superstructure over the entrance, lobby and corridors, and all galleries and supports for the same in the auditorium, shall be constructed of iron or steel and fireproof materials, not excluding the use of wood floor boards and necessary sleepers to fasten the same to, but such sleepers shall not mean timbers of support, and the space between the sleepers, excepting the portion under the stepping in the galleries, which shall be properly fire-stopped, shall be solidly filled with incombustible material up to the under side of the floor boards.

Actors' dressing-rooms shall not be placed on the stage, under the stage, over the stage, on the fly-galleries, nor under the auditorium, but shall be placed in a separate section provided for that purpose. The walls separating said section containing the actors' dressing-rooms from the stage shall not be less than 12 inches in thickness, and the openings therefrom to stage shall be protected with standard self-closing firedoors. The partitions dividing the dressing-rooms, together with the partitions of every passage-way from the same to the stage, and all other partitions on or about the sides of the stage, or fireproof portion thereof, shall be constructed of fireproof material not less than 4 inches in thickness, approved by the Department of Buildings. All doors in any of said portions shall be standard firedoors.

Standpipes of not less than 4 inches in diameter shall be provided with hose connections as follows:—One on each side of the auditorium in each tier, one on each side of the stage in each tier, one within 10 feet of the door of the property-room, one within 10 feet of the door of the carpenter's shop and scenery storage-room. All of such standpipes and hose connections shall be kept clear of obstructions. Said standpipes shall receive their supply of water from a gravity tank located over stage roof, bottom of tank at least 12 feet above highest point of roof and of not less than 5,000 gallons capacity, and in addition at least one of the following sources:—(*a*) Approved steel pressure tank of not less than 5,000 gallons total capacity, located on stage roof or not lower than gridiron floor; (*b*) automatic fire pump of not less than 500 gallons capacity per minute; (*c*) from city mains where pressure is not less than 25 lbs. per square inch at level of highest hose outlet. Pipes shall be fitted with approved straightway composition gate valves at hose outlets, and the thread of all connections shall be uniform with that in use by local fire department.

A sufficient quantity of approved cotton rubber-lined hose and linen hose not less than 2½ inches in diameter, in 50-feet lengths, but not less than 50 feet in total length, shall be kept attached to each hose connection in the stage portion and auditorium respectively. Hose shall be fitted with washers and equipped with couplings and nozzles, the thread of which shall be uniform with that in use by the local fire department.

A system of automatic sprinklers approved by the underwriters having jurisdiction shall be installed throughout the entire stage section of the theatre located in the rear of the proscenium wall; this to include under roof, under gridiron, under galleries, under the stage, in all dressing-rooms, in all workshops, property and all other rooms and passage-ways.

There shall be an independent water supply to the sprinklers, which may consist of a gravity tank not less than 10,000 gallons capacity, and elevated not less than 25 feet above the highest sprinkler, and, in addition, at least one of the following sources:—(*a*) Automatic fire-pumps of at least 500 gallons capacity; (*b*) approved steel pressure tank of not less than 7,500 gallons capacity, located not lower than the highest line of sprinklers; (*c*) direct supply from city water mains where the pressure is sufficient to maintain not less than 25 lbs. at highest line of sprinklers when same are in operation. In addition to one or more of the above-mentioned supplies, there shall be a Siamese steamer connection placed on the outside of the building at each street front, with suitable iron plate with raised letters securely attached to the wall near steamer connection, reading, "Automatic sprinklers on stage." The location and spacing of sprinkler heads and the schedule of pipe sizes conform to the standard recommended by the National Board of Fire Underwriters.

Gas mains and electric-light wires supplying the building shall have three independent connections as follows:—One for the stage, one for the auditorium, excepting the exit lights therein, and the third for the halls, corridors, lobbies, exit lights, including the exit lights in the auditorium and such other portions of the building used by the audience outside of the auditorium proper. All gas and electric lights in the halls, corridors, lobbies and other portions of the building used by the audience, with the exception of the auditorium proper, but including the exit lights therein, shall be controlled by two separate switches or valves, one to be located in the lobby and the other to be so located as to be operated from the outside of the building. Provision shall be made for shutting off all gas at a point outside of the building. Interior gaslights must be lighted by electricity or other suitable appliances to be approved by the underwriters having jurisdiction.

GENERAL.

The Second Competition for the Hove Library has resulted in the recommendation by Mr. Belcher, A.R.A., of the following designs, viz.:—1st, Messrs. Percy Robinson & W. Alban Jones, 53 Albion Street, Leeds; 2nd, Messrs. A. J. Hardwick & Sydney E. Castle, Kingston-on-Thames; 3rd, Mr. Lionel U. Grace, 30 John Street, Bedford Row, London. The library committee have approved of the recommendations, subject to the tender for the first design not exceeding 9,333*l.*

Mr. Philip E. Pilditch, architect, of Messrs. Pilditch, Chadwick & Co., has been presented by Unionists of the Western or St. Ives Division of Cornwall, at Penzance, with a massive copper shield, worked emblematically of Cornish industries, "in recognition of his gallant and honourable fight at the general election of 1906." The *repoussé* shield was produced at the Newlyn industrial art school.

The Ayr Town Council have agreed to grant an honorarium of 200*l.* to Mr. John Young, burgh surveyor, for work done in connection with the extension of the Corporation tramways to Burns's monument.

The Following Appointments have been made:—To be director of the National Gallery, Sir Charles Holroyd; to be keeper of the National Gallery, British Art (the Tate Gallery), Mr. D. S. MacColl.

M. Denys Puech, the sculptor, has given 40,000 francs towards the erection of a gallery in the Musée of Rodez for the exhibition of works by the artists of the province.

The Education Committee of the York City Council on Monday reported as follows in reference to the restoration of pictures in the Art Gallery:—"The two large pictures supposed to be 'Old Masters' are serviceable as revealing in their disintegration the processes which go to the 'manufacture' of an 'Old Master.' There are other 'Old Masters' which add nothing to the art of the gallery."

The Heritors of Haddington parish, N.B., have agreed to the transference of the ruined portion of the parish church ("Lamp of Lothian") to H.M. Board of Works on specified terms. The ruined portion, which will be transferred to the Board of Works, is the original church of St. Mary, and forms the chancel of the whole building as it now stands. It is a picturesque ruin and contains the grave of Jane Welsh Carlyle, with the burial vault of the Lauderdales. It is expected that the Board of Works will shortly carry out needed repairs on the ruin.

Mr. Darnton Hutton, M.I.C.E., of 14 Cumberland Terrace, Regent's Park, died on May 11, leaving property valued at 96,682*l.* gross and 96,375*l.* net. He gave 100*l.* to the Benevolent Fund of the Institute of Civil Engineers.

Mr. George Low, of 12 Upper Park Road, Haverstock Hill, N.W., and 10 Basinghall Street, E.C., architect and surveyor, left property valued at 16,020*l.*

An Exhibition of paintings of Egyptian temples, including the new discoveries at Deir-el-Bahri and other places on the Nile, by Mr. Frederick F. Ogilvie, has been opened at the Modern Gallery, 61 New Bond Street, W.

M. Charles Hoffbauer has been awarded the Prix National of 400*l.* for his painting *Triomphe d'un Condottière*, now in the Salon.

The Edinburgh Architectural Association on Saturday afternoon paid a visit to Hatton House, Kirknewton. Mr. Harold O. Tarbolton, who acted as leader, stated that the oldest record of the estate of Hatton was dated 1374. On the way to Hatton House the party visited Kirknewton churchyard and viewed the old hog-backed tomb. A visit was also paid to Ratho Church. The party was entertained to tea at Ashley, near Ratho, by Mr. Robert S. L. Hardie, one of the members of the Association.

Professor Henry Morse Stephens, of the University of California, has been instructed to compile an accurate and complete record of the San Francisco earthquake and great fire and of the relief work necessitated thereby. The Mayor of San Francisco has ordered that all the official documents be turned over to Professor Stephens, and has asked the military authorities to co-operate with him. Professor Stephens proposes to divide the history into three sections, devoted respectively to the earthquake, the fire and the relief work. The history will end with the restoration of normal conditions and the beginning of the projected rebuilding of a greater San Francisco.

The Worcestershire County Council on Monday passed a resolution declaring that as main roads were now used by many persons who contributed nothing to local taxation, and as such traffic materially increased the cost of maintaining roads, legislation should be introduced at once to relieve the owners and occupiers of land as such from bearing the entire cost of road repair. It was decided to ask all other County Councils to co-operate in this representation.

The Greenock Dean of Guild Court have passed the plans for the James Watt Memorial inaugurated by Mr. Andrew Carnegie, who contributed the bulk of the money towards the scheme. The building will be erected on the site formerly occupied by the house in which Watt was born, at the corner of William Street and Dalrymple Street. It will be of the old Scots style of architecture, and will be used partly as a museum and partly as a school of engineering.

The Ephesus Room in the British Museum is being redecorated. A rearrangement of the sculptured remains of the Diana Temple is to be made, and certain capitals and other architectural details which properly belong to the Ephesian group will be transferred from the Archaic Room.

Judge Emden declared in the Tunbridge Wells County Court on Tuesday that justice could not be rendered in important cases under such wretched conditions, and if something was not done to remedy the defects of the building he should report the matter to higher quarters.

The Governors of the Glasgow School of Art, authorised by the Scottish Education Department, have granted six maintenance bursaries of 20*l.* each, with free tuition, and seven travelling bursaries of 10*l.* each, and one of 5*l.*, competed for during the session now concluding.

The Offices of the Quantity Surveyors' Association (Incorporated) will be moved to Caxton House, Westminster, S.W., after the 24th inst.

Students of tree forms will find the post-cards issued by the *Country Press*, with descriptions by Mr. F. J. Heath, of great use. Cards with ferns and plants are also prepared.

The Edinburgh Town Council have agreed on the composition of the provisional committee in connection with the proposed Edinburgh Art School. Its composition will be as follows:—Appointed by the Board of Manufactures, 3; by the Royal Scottish Academy, 3—a painter, an architect and a sculptor; by the Heriot-Watt College, 2; by the School Board, 1; by the Edinburgh Town Council, 10, including the Lord Provost, *ex officio*—total, 19.

The Town Hall and Markets Committee of the Salford Town Council on Tuesday considered in private a report on the subject of town hall accommodation prepared by the special sub-committee. This body report that it is desirable to build a new town hall, as it is unwise to extend the present building. They report that a new town hall, similar in size and character to the technical institute, could be built within a cost of 70,000*l.*

The Northern Architectural Association have decided, in order to enable the President and others to attend the annual excursion, to defer the visit to Beverley to Thursday, July 5, leaving Newcastle at 9.30 A.M. It is proposed to dine at the York station hotel in the evening, and thus allow about five hours to be spent in Beverley in visiting the two churches, &c., under the guidance, it is expected, of Mr. John Bilston.

The Report dealing with the museums and galleries of Glasgow Corporation shows that during 1905 two new branch museums were opened to the public, bequests and gifts of exceptional value were received, and intimation was made of the bequest of a personal estate of a large amount, subject only to certain life-rent interests. It is stated that the innovation of Sunday opening on June 11, 1905, was effected with marked smoothness and good order. Family parties form a conspicuous and gratifying feature of the Sunday attendance. Up to the close of the year the numbers entering the institutions on Sunday were:—Kelvingrove, 103,398; Camphill, 15,225; People's Palace, 63,497; Tollcross, 38.749; and Mosesfield, from October to December, 4,487. The grand total of visitors to all the institutions throughout the year numbered almost a million and a half.

The Cardiff City Council on Tuesday resolved to borrow the sum of 20,790*l.* from the Corporation of Sheffield for the provision of a public elementary school, and to affix the common seal to an indenture of mortgage thereon.

In the June report of the Amalgamated Society of Engineers Mr. Barnes, the general secretary, congratulates members on the continuance of good trade.

Mr. R. H. Bicknell, Local Government Board inspector, held an inquiry at the Birmingham Council house on the 11th inst. respecting the application by the Tame and Rea drainage board for sanction to borrow 49,500*l.* for thirty years, for the purpose of constructing four additional bacteria beds at Minworth Greaves. The town clerk stated that similar provision had been previously made. The new beds will cover an area of 6½ acres, making a total acreage of fourteen and a half. Mr. J. D. Watson, the engineer of the Board, pointed out that at the present time they were able to deal with about a quarter of the dry weather flow by means of the beds already in existence. The new ones were to be constructed on the same principle but at a less cost. The imperative necessity for more beds was shown by the fact that they were now dealing on the land with the sewage from 450 persons per acre, which was abnormally high, as it was held that anything above 100 or 150 per acre was excessive.

The Annual Statement of the Royal Exchange Assurance is one of those documents which must give gratification to others besides the fortunate people who belong to the Corporation. Established in 1720, it has long been esteemed as a national institution. The figures relating to all departments inspire confidence. Like other British offices the Royal Exchange Assurance has lost by the San Francisco fire, but the directors do not anticipate that the sum to be paid will exceed 450,000*l.*, which can be done with ease by such a company. All the departments—life, annuity, sinking fund policies, fire, marine accident, trustee and executor—can show satisfactory returns for the year. The assets stand at 5,398,968*l.*

The Architect.

THE WEEK.

THE programme for the forthcoming International Congress of Architects has been published. The proceedings will commence on July 16, when there will be a reception at the Grafton Gallery, an inaugural reception at the Guildhall, and a soirée at the Royal Academy. On Tuesday, Wednesday and Thursday mornings papers will be read at the Grafton Gallery and the Institute meeting-room. On the same days there will be visits to various buildings and also to the works of Messrs. HOLLOWAY and Messrs. DOULTON. The Lord Mayor's conversazione will be held on Tuesday. On Wednesday and Friday evenings papers will be read at the Grafton Gallery and the Institute meeting-room. On Thursday evening there will be a garden party at the Botanic Society's Gardens. The farewell banquet will be held at the Hôtel Cecil on Saturday evening. There will be exhibitions of photographs of buildings by living British architects, a chronological exhibition of British architecture from 1066 to 1860, views in oils and water-colours of British architecture, specimens of British furniture and silverwork, and a selection of Viennese students' drawings. The steward-interpreters will wear colour badges to show the languages with which they are conversant.

AN interesting case with respect to fees has been decided on appeal in Edinburgh. Mr. F. S. COLLEDGE, a civil engineer, claimed 2,853*l.* 15*s.* from the Glasgow and Renfrew District Railway Company, the balance of his fees. According to the agreement entered into between the parties Mr. COLLEDGE was to be paid a sum equal to 4 per cent. on the Parliamentary estimate of the cost of the works of the authorised lines for which plans had been prepared, including the 10 per cent. allowed for contingencies. A Parliamentary estimate has to be made out partly for the information of the committee, who have to consider whether the project is worth approval, and partly to raise the money which has to be lodged in order to prove the project to be a bona-fide one and which is a percentage of the Parliamentary estimate. The amount also includes the value of the land. In the case in question 55,108*l.* was put down for the value of the land out of a total of 183,844*l.* The company paid Mr. COLLEDGE 4,500*l.*, but declined to pay any percentage on the outlay for land and buildings. When the case was first heard the Judge approved of the action of the company. Mr. COLLEDGE appealed. But the Court of Session decided against him, with costs. Their Lordships held that "works" was to be taken as signifying works which were constructed, and did not comprise the outlay for ground on which the works were to be carried out. The case, we hope, will not be taken as a precedent, for it often happens that in building works, as well as in those known as engineering, architects and engineers occupy much time in the arrangements for acquiring ground. A valuer or estate agent is not always employed, and it would not be equitable if work which involves so much responsibility should be always performed gratuitously.

BESIDES the river Liffey, which forms a sort of diameter for Dublin, the city has also outside its boundaries a river known as the Dodder. In summer the bed is often dry, but in winter it presents the spectacle of "spates" on a small scale. To carry the principal road from Kingstown to Dublin across the Dodder must have been considered a work of difficulty, for the bridge was not only called after the engineer, Mr. BALL, but the village which grew up in the neighbourhood became known as Ball's Bridge. Of late years it has increased in importance owing to the exhibitions of the Dublin Society which are held there, and the place has also been selected for the international exhibition of next year. The bridge which served for the traffic sixty or seventy years ago is altogether unfitted for tramways, which now run over it, and for a large number of vehicles. The local District Council and the tramways company therefore came to the conclusion that the bridge should be widened. The company apparently supposed that the abutments would serve and all that would be required could be done for a sum not exceeding 700*l.* They agreed to pay the amount certified by the engineer. When the bill came in it amounted to 8,413*l.* 15*s.* The company refused to pay the sum, alleging that the District Council had practically rebuilt the existing bridge and replaced it by a virtually new structure, constructed according to elaborate and extravagant designs and estimates, which were not in keeping with the design and character of the said existing bridge and not necessary for its proper widening or improvement. The grounds on which the tramway company relied were that the surveyor to the Council had stated that the work could be done at a cost of from 600*l.* to 800*l.*, but under the circumstances they offered to pay 3,000*l.* After further consideration between the parties it was agreed that the plaintiffs should receive 5,500*l.* with costs, or, in other words, to split the difference between them. The case should be taken as a warning to those who are willing to leave the carrying out of works to other parties without having a definite agreement as to the outlay. An excess of confidence in the honour of others often leads to unsatisfactory results.

ALTHOUGH the Médaille d'honneur is the most important of the Salon prizes the Prix du Salon is the most substantial, for it means a sum of 10,000 francs, or 400*l.* It is therefore much sought after by young artists, or rather by painters and sculptors, for an architect rarely has a chance of a majority of votes. This year the contest was between M. CHARLES HOFFBAUER, the painter of the *Triomphe d'un Condottiere*, and M. ALIX MARQUET, the sculptor of the *Fin de Labeur*. The former was successful. On the same occasion the votes for the nine *bourses de voyage*, each of the value of 4,000 francs, or 160*l.*, were taken. The two fortunate architects were M. VENTRE, who was the author of a series of drawings for the restoration of the churches of Chars and Triel, and M. BANS, who designed an Æro Club. The painters who gained *bourses* were MM. DILLY, JACQUIER and CAUCARET. The sculptors were MM. CORNU, LAFFEUR and LHOEST. For lithography and etching M. TOUPEY was the winner.

THE Congress of the Royal Sanitary Institute is to be held in Bristol from July 9 to July 14, under the presidency of Sir EDWARD FRY. Three section meetings of two days each will be held. Engineering and architecture will be presided over by Mr. EDWIN T. HALL. The special conference relating to engineers and surveyors to county and other sanitary authorities will have Mr. H. PERCY BOULNOIS as chairman. Among the subjects which have been arranged for discussion are:—"The Construction of Isolated Homes for the Aged Poor *versus* the Workhouse," to be introduced by Mr. A. SAXON SNELL, F.R.I.B.A.; "The Influence of Dust on Health," to be introduced by Dr. PHILLIP BOOBBYER; "The Rational Extension of Modern Cities," to be introduced by Mr. ARTHUR RICHARDSON, M.P.; and "Rural Road Construction and Maintenance," to be introduced by Mr. R. PHILLIPS, M.I.C.E. There will be visits to local places of interest, garden parties in the grounds of Goldney House, Clifton, and elsewhere, and excursions to Cheddar, Wells, Blagdon, Wye Valley, Chepstow, Tintern, Bath, Weston-super-Mare, Minehead, Lynton, Ilfracombe, &c

JOHN NASH AND REGENT STREET.

IT is the fate of architects to have their works criticised without much consideration for the circumstances under which they were executed. It might be imagined that an architect is entrusted with some magic wand or spell which enables him to summon the services of able assistants and to command the conveyance of the costliest materials from distant regions. In criticising buildings it seems to be forgotten that money is required; and that in the majority of cases, whether the buildings are public or private, money is only niggardly doled out. No modern architect was subjected to that kind of scrutiny like JOHN NASH. We should remember that in 1813, when the Act was obtained for laying out Regent Street, the majority of people in England, and especially the trading class, believed the country was about to be ruined. The long war with France, which comprised the subsidising of that country's continental enemies, had impoverished the Treasury. Taxation was heavy, and the price of food suggested famine in the land. At such a time was it to be expected that the speculators in sites in Regent Street would erect premises with materials that could endure for centuries? Yet the wits of the time criticised NASH as if he wielded the despotic power of a Roman emperor:—

> Augustus at Rome was for building renown'd,
> And of marble he left what of brick he had found;
> But is not our Nash, too, a very great master?
> He finds us all brick and he leaves us all plaster.

At the present time it must be allowed that the attacks on the memory of JOHN NASH are still expressed with equal rancour if with less wit. It is, however, a remarkable fact that the architect was no more in favour of showy but defective building than many other men who are compelled to give their services to clients who are economical to excess. There is a report of his, dated 1811, relating to buildings on Crown property in the district lying north of the New Road, and therefore prior to the time when the works of Regent Street were undertaken. In the course of it he says:—

> It is the interest of those concerned in such buildings that they should be of as little cost as possible, preserving an attractive exterior, which Parker's stucco, coloured bricks and balconies accomplish; and a fashionable arrangement of rooms on the principal floors, embellished by the paperhanger, and a few flimsy marble chimney-pieces are the attractions of the interior. These are sufficient allurements to the public, and insure the sale of the houses, which is the ultimate object of the builders, and to this finery everything out of sight is sacrificed, or is no further an object of attention than that no defects in the constructive and substantial parts shall make their appearance whilst the houses are on sale; and it is to be feared, for want of these essentials which constitute the strength and permanency of houses, a very few years will exhibit cracked walls, swagged floors, bulged fronts, crooked roofs, leaky gutters, inadequate drains and other ills of an originally bad constitution; and it is quite certain, without a renovation equal to rebuilding, that all those houses, long, very long, before the expiration of the leases, will cease to exist, and the reversionary estate the proprietors look for will never be realised, as it is not till the end of the builder's term that the proprietor of the fee will be entitled to the additional ground rents laid out by the builder.

These words are an anticipation of the "jerry-building" of a later time. But it is not to be supposed that an architect who was so well aware of the consequences of defective work would advocate the adoption of similar treatment in a street that was expected to be the most important of the Metropolis. JAMES ELMES tells us that the sites in Regent Street were offered under severe restrictions as to external design and quality of materials. Nor did NASH compel any of the lessees to employ him as their architect, although he easily could have done so. In the agreements he merely reserved to the Commissioners and himself the right of rejecting plans out of keeping with the style of the street. Sir JOHN SOANE, C. R. COCKERELL, REPTON, DECIMUS BURTON, ABRAHAM and the SMIRKES were also enabled to prepare designs for buildings. It is therefore an error to assume that JOHN NASH monopolised everything. He did not, of course, decline to prepare designs, and some of the best buildings can be credited to him. Like all architects who become responsible for extensive works, he was eager to see Regent Street completed. Accordingly he resolved to act as builder as well as architect. Nevertheless, he did not seek to be favoured with better terms than other builders, and it was understood at the time that he lost money in the speculation. If the buildings are showy, but unsubstantial, the true cause is to be found in the financial conditions under which the work was carried out.

Dr. JOHNSON considered the great defect of London to be its excessive largeness. But in his time it was overcrowded. It must have been present to the minds of the authorities that by laying out a new thoroughfare through St. James's Market to Castle Street, where the Quadrant—a square with a public building in the centre—was to be formed, and then along Swallow Street to Oxford Street and northwards to Marylebone Park, many valuable building sites would be created. It should also be remembered that GEORGE III. at one time was favourable to the erection of a palace in the park, and the new street would be an almost straight line from the residence of the king to that of his son in Carlton House. In fact, building had commenced in the neighbourhood of the park before the plans of the new thoroughfare were approved. It is creditable to NASH that in none of his plans did he propose to do more than to erect a crescent with fine buildings outside the park. The only buildings he suggested for the park were a royal palace and a church. Some of the rival official surveyors proposed to treat the whole park as a building estate which should be laid out with roads lined by mansions of a costly kind. If they had succeeded London would now be deprived of one of its most prized open spaces. It must be said that the early building experiments in the neighbourhood of the park were not successful, owing to the difficulty of the people who took leases finding capitalists who were prepared to finance them.

We do not claim for JOHN NASH a place among the great English architects. He was not inspired when treating detached building. The defects of Buckingham Palace are by some charged to EDWARD BLORE, who departed from the designs of NASH. The Pavilion at Brighton could hardly be taken seriously as a work of architecture, or judged by its appearance at the present day. The Prince Regent was pleased with it, and the designer was inspired by no higher aim. He enlarged the Opera House which then existed, and received commissions for many large mansions. He could be considered as a fortunate man, but it must be acknowledged he knew how to take advantage of opportunities. He was a native of Wales, though little is known about his early life. He became a pupil of Sir ROBERT TAYLOR, where he had for his fellows SAMUEL PEPYS COCKERELL, the father of C. R. COCKERELL, and LEACH, who afterwards was Master of the Rolls. He early showed his courage by preparing drawings for which the seniors in the office considered the time was too limited. Afterwards, when he attained success, he was one of the kindest of masters. He bought East Cowes Castle, in the Isle of Wight, as a country house, and he used to allow his pupils and assistants to stay with him. The first of the PUGINS was engaged by him as a draughtsman, and as the refugee was something of an archæologist, NASH left the Gothic department to him. As castellated mansions were in fashion, the arrangement was wise. His architectural work was of a kind which suggested his theatrical aspirations. He erected a theatre for himself in Wales, and he used to perform on the stage

with some of his friends. He had opportunities for acquiring wealth. As one of the architects of the Board of Works he received an annual fee of 500*l.*, with a commission of 3 per cent., which was in 1826 increased to 5 per cent., on the expenditure. When he died in 1835 it was understood that his property was not large. However, it is occasionally stated that he was very wealthy. JOHN NASH was certainly a kindly, honest man, and it may be doubted whether under similar circumstances another architect would have been more successful in carrying out the Regent Street commission at a time when only limited funds were available for building speculations.

JEAN BAPTISTE CARPEAUX.

CARPEAUX, the sculptor, died in 1875, and during the thirty years which have elapsed it has never been difficult to excite a controversy respecting himself and his works. As a man it is easy to allege that he was a toady of the Imperial Court, and a story used to be told about his lying in wait in railway stations for the Emperor in order to obtain a commission for his big relief of the liberation of ABD-EL-KADER. His works were subjected to severe criticism by some, while other critics considered he was the foremost sculptor of the age. At the present time the discussion is being renewed. His group of *Ugolino* has been removed from the gardens of the Tuileries, and his *Dance* before the Opera House is likely to meet a similar fate. If the two works are placed under a roof it is for their preservation. But unkind people assert their withdrawal is owing to their unfitness to appear in public places.

CARPEAUX should be regarded as a sign of his time. The dissatisfaction which is always surging in the French mind because the world was not made to suit them alone extended to art. Young and ardent spirits considered they were acting as hypocrites in representing human beings according to academical rules. No doubt the dissatisfaction existed at an earlier time. The great relief of the departure of the conscripts by RUDE is a startling contrast to the three other groups on the piers of the triumphal arch. It is vivid, while they are essentially sculpturesque according to the old canons. But RUDE hesitated to represent his warriors as Frenchmen living at the close of the eighteenth century. They are not such revolutionaries as CHARLET and RAFFET immortalised. RUDE's work was a compromise, and some of the heads might have been suggested by Greek gods and heroes rather than by ordinary models. CARPEAUX was a pupil of RUDE, and we see the same spirit of compromise in the famous group of *The Dance*, especially if we compare the figures with the companion groups at the Opera House by GUILLAUME, JOUFFROY and PERRAUD. The latter sculptors realised the function of their groups, which was to decorate the piers of the building, and the figures were therefore as expressive of immobility as suited the subjects. But CARPEAUX was one of the artists who would not recognise the ancient office of sculpture, and he endeavoured to represent motion that is almost delirious. The scene may recall the students' halls of Paris, but the Bacchanals belong to a different age.

It is curious that so remarkable an innovator went through the same course of training as the sculptors whose works form such a contrast with his group. CARPEAUX was born at Valenciennes in 1827. His father was a mason, and the son had the physical aspect of a man who lived by hard work as a stonecutter. He was seventeen when he entered the Ecole des Beaux-Arts, and not until ten years had elapsed was he able to win the Prix de Rome. Of course, the subject was classic, *Hector carrying his Son.* Many censors have since 1854 condemned the practice of sending young artists to Rome, because they believe that the training in the Villa Médicis only renders them still more academical. But the true artist will always find in Rome his special nourishment. CARPEAUX considered that when he left Paris his work was of the cast-iron class. It was in Rome he discovered contours and flesh. His application was unceasing, and as soon as he went to the school he began modelling his *Petit Pêcheur à la Coquille*, a boy with a shell to his ear, which has been a favourite subject with poets as well as painters and sculptors. The *Figaro* has been able to gratify the curiosity about CARPEAUX by publishing a series of letters to a young friend which the sculptor wrote from Rome. Although he was surrounded by classic masterpieces it is remarkable that CARPEAUX did not forget his old master, and he begs that a cast of the head of the *Petit Pêcheur* by RUDE, which is now in the Louvre, should be sent to him without delay. As his own work was nearly complete he had no desire to copy it. But he was anxious to be able to compare it with a more real standard than any ancient work. In those days CARPEAUX wished to remain in Rome during his life, instead of for the brief period allowed by the term of his prize. For, as he said, the old capital offered more *motifs* for inspiration than were to be found in France. He was beginning to understand why POUSSIN preferred Rome to Paris.

The modelling of the statue was to an able man like CARPEAUX the easiest part of the undertaking. The other prizemen praised it as a masterpiece, and HÉBERT, who afterwards became director of the school, told him it was sufficiently satisfactory to be placed beside RUDE's figure. But the praise of artists did not overcome the financial obstacles. CARPEAUX naturally wished to see his statue in a more enduring material than clay. For so excellent a production the French Government could not refuse to provide the necessary block of marble. But in that case not more than 2,000 frs. would be paid for the sculptor's work. CARPEAUX had no objection to express his ideas in marble. But he considered bronze was better adapted to the subject, and that would be very expensive. He obtained somehow sufficient support to have an experiment made. But the moulders were careless and they charged him 265 francs for casts of the figures in wax which were not worth two sous. At one time he was desponding and believed his model was defective. Then somebody encouraged him and he resolved to send the model to Paris. He knew he could count on the kindness of the late M. EMILE LEVY, the painter, whose influence would be sufficiently strong to prevail with the founders and to obtain from them a satisfactory copy.

Having passed through all the impediments which beset his first important work, CARPEAUX immediately set about another which was to be of a more ambitious character. This was to create a group that would rival the *Laocoon*, and was to represent DANTE's story of the unfortunate Count UGOLINO and his sons. So many attempts had been made in the old days of high art to represent that terrible story—Sir JOSHUA REYNOLDS's being one of them—it might be imagined that CARPEAUX could easily find a more satisfactory subject. But, as we have said, he was a representative man, and like succeeding realists he was ambitious to grapple with the terrors to which humanity is liable. A famished man contemplating cannibalism was as tragic a motive as serpents devouring a Trojan priest. He worked at it with such fury as to exhaust his strength. When the group was completed SCHNETZ, the painter, who was director of the school, informed him that a group with three figures was contrary to the rules and regulations, and could not be approved. He advised CARPEAUX to break up the group, cast aside the two sons, and to turn the father into a *Saint Jerome.* The supposed adaptability of his work was a compliment to the sculptor. We must not condemn SCHNETZ. He was an official, and was bound by the customs of the Villa Médicis. Afterwards, when the group in clay found its way to Paris, and when the Academicians reported against its purchase and reproduction by the State, SCHNETZ became the champion of the sculptor,

Digitized by Google

whom he declared to be a great artist. And it was by his influence the decision was set aside, and that the *Ugolino* in bronze became an ornament of the Tuileries gardens.

Meanwhile CARPEAUX was compelled to go through a period of anxiety. At one time he had fears that he must die of hunger if he continued faithful to sculpture. He fell into ill-health, and not only his hopes but his ideas appeared to vanish from day to day. He began to lose confidence in himself, and although he abominated idleness he found he was unable to work, and came to think that nature had not made him an artist. But a gleam of success was happily sufficient to dispel all his apprehensions. His *Pêcheur* aroused so much interest in Paris that visitors to Rome deemed it a privilege to be allowed to visit the studio of one of the rising artists of France.

Among the visitors the most influential was the Count de NIEUWERKERKE. He was the successor of Count D'ORSAY, and could be considered as the chief adviser of the Imperial Court in all matters of art. He was struck with the power shown in the *Ugolino*, and he obtained a commission for CARPEAUX to execute a bust of the Princess MATHILDE. Through her influence he was nominated to the Legion of Honour. But all that the *Ugolino* and the bust could gain from the Academicians, who then controlled the Salon, was a second-class medal. He afterwards was employed on the decoration of the Pavillon de Flore, and, inspired by the title, he produced a group in high relief of the goddess and children surrounded by flowers. He received other public commissions, and if the Empire could have lasted he was likely to be the foremost of the official sculptors. The fall of the Government compelled him to find in London a refuge from the Communists. Although he was, if possible, more competent to produce busts than large figures, he was unable to secure English patronage. He ascribed the absence of success to the jealousy of English artists. But it would not have been difficult for him to discover in 1871 that sculpture was not much favoured among us. In 1873 he modelled a bust of the ex-Emperor at Chislehurst. He did not live long after his return to France, for he died in 1875. Time has not been friendly towards him, and the position he is to hold in the history of art has not been determined by his countrymen. But, as one of the first men who tried to impart some of the qualities of painting to figures in bronze and marble, he is entitled to be respectfully remembered.

ARCHÆOLOGY OF THE ANDOVER DISTRICT.

THE members of the Hampshire Field Club and Archæological Society had a very pleasant and interesting meeting in the Andover district last week, says the *Hampshire Advertiser*. The programme was arranged by Mr. C. J. Phillips, hon. local secretary for Andover, and Mr. W. Dale, the hon. general secretary. After assembling at Andover Junction railway station, they went first to Thruxton, passing *en route* the site of the Roman villa discovered in 1823, and further dealt with in 1899 by the Rev. G. Engleheart, F.S.A. The discovery included a five-coloured mosaic pavement, circa A.D. 300, with the inscription "Quintus Natalius Natalinus et Bodeni," and a figure of Bacchus, cup in hand, riding on a panther. This laid for many years after in the field where it was found, and in 1899 was transferred to the British Museum. At Thruxton Church Mr. W. Dale read a short paper, in which he said:—

It is now seventeen years since we, as a club, visited this interesting church. Its architecture I leave in other hands, and merely remind you that Thruxton is not mentioned in Domesday, but was probably included in the great manor of Anne. The entry concerning it is "Gozelin de Cormelies holds Anne of the king, and Saxi held it allodially of King Edward as a manor." The Rev. de Foe Baker, who met us here in 1889, ascribed the rude effigy at the west end of the church to Sir John de Cormaille, a baron who held the manor in Norman times. From the Cormailles were descended the Lisles, and the most interesting monument in the church is a fine fifteenth-century brass to Sir John Lisle, who was Governor of Jersey, and who died in 1407. The brass was made in 1420, and is the earliest representation of complete plate armour; the spurs are particularly worthy of notice. Mr. de Foe Baker informed us that the actual armour was long in existence, and was sold in the village for old iron. I am inclined to think this is a story based in the preservation of the helm and vizor (formerly in the church, but not now to be seen), which may be only undertaker's furniture. From the Lisles of Thruxton was descended the John Lisle who was one of the judges of Charles I., and one of Cromwell's lords, the husband of Alice Lisle, whose story has engaged our attention more than once at Ellingham and Moyle's Court. The recumbent monuments close by are the effigies of another Sir John Lisle and his wife, Mary Courtenay. He lived in the early part of the sixteenth century, and was a herald at the Field of the Cloth of Gold. They are considered to be portraits, and were the work of an Italian artist brought over by Lord Sandes. The material is hard chalk. Another important family which held the manor of Thruxton were the Philpotts. The rector, the Rev. J. Collin, very kindly sent me an extract from the Royalist Composition papers, series II. V. v. 169, giving particulars of a fine imposed upon Henry Philpott of Thruxton—his delinquency being that he was in arms against Parliament. Some of us will probably recollect seeing here in 1889 a wooden effigy of Lady Elizabeth Philpott, who lived at the close of the sixteenth century, and we hope to see it again—monumental effigies of wood are very rare. This is one of three we have in this county—one at Gatcombe and another at Pamber. The face is unfortunately mutilated, but the rest of the effigy is in fair preservation; the wooden block on which the head rests is carved in imitation of lacework.

Passing round the church, which has a Transition Norman tower, but is mainly Decorated and Perpendicular, the fine Lisle brass referred to was inspected with great interest. It is in excellent preservation and well taken care of, which can hardly be said of the recumbent Lisle effigies carved in the native chalk. The right foot of the baron is off and lying on the tomb, and there are numerous other bits close by, indicating that some steps are necessary if destruction is to be averted. The rare wooden effigy is not in the church, but has been removed into a barn at the rear of the rectory garden, where apparently it is left to decay as it will. Mr. Dale said the date of it was about the closing years of Elizabeth or the early years of James I. As he stated at the annual meeting of the club at Winchester, it was time it was taken more care of. When he last saw it it was stacked round with firewood, but that had been removed. Mr. Doran Webb, architect to the Dean and Chapter of Salisbury, took great interest in the figure, and wrote to the Philpott family about it, the reply being they did not want to have anything to do with it. In 1899 it was taken out of the tower of the church and laid upon the lawn, and afterwards carried into the barn.

The Rev. A. G. Davis asked if anything was known of Lady Elizabeth's history, and Mr. Dale replied that the Philpotts were descended from the Lisles, but who Lady Elizabeth was before her marriage he did not know. If the rector refused to have it back in the church it should be placed in a museum.

The Rev. T. Thistle, of Eling, moved that the hon. secretary be instructed to write to the Archdeacon of Winchester, who was responsible, he said, for the preservation of the churches and the furniture therein, calling attention to the fact that this effigy, which used to be in the church, had been removed without a faculty, and was in danger of destruction.

The Rev. R. White, of Titchfield, seconded the proposition, which was agreed to.

Mr. Dale said he was sorry the vicar, who had promised to receive the club, was not present, but his daughter had informed him that he had been called away. They were much obliged to the rev. gentleman for opening the church to them.

The party then proceeded to Appleshaw, halting about a mile from the village and entering a field, where they were met by Mr. Cecil Edwards, lord of the manor, who by the aid of a map described the locality of the remarkable Roman remains discovered there in 1897, and also showed photographs of some of the pewter vessels and other relics that were found and are now in the British Museum.

Mr. Dale said the locality was one exceptionally rich in

Digitized by Google

Roman remains. Traces of Roman occupation had been found at Fyfield, Kimpton, Appleshaw, Clanville, Rambridge, Thruxton, Abbotts Ann, Finkley, Tinker's Hill, Andover Down and other places, all within a comparatively small radius. They passed on entering the parish of Thruxton the site of a Roman villa or building discovered in 1823. No plan of that building exists, for at that time people were not so anxious to obtain information concerning the domestic life of the Romano-British as we are to-day. The systematic exploration of the town of Silchester begun in 1890, and now drawing to a close, was undertaken, not with the object of finding coins, brooches, pottery, &c., which look so pretty in museums, but for the purpose of trying to find out what kind of houses the Romans lived in, and their habits and pursuits. The description left of the foundations discovered at Thruxton seems to point to it being a house of a very simple type. The principal discovery was a fine mosaic pavement with part of an inscription. In the centre was a small round panel with a figure of Bacchus seated on a tiger, and various geometric devices round it. The foundations discovered in 1823 appear to have been destroyed, but the pavement was in 1899, through the exertions of the Rev. Geo. Engleheart, F.S.A., taken up, and is now on the staircase at the end of the King's library in the British Museum. It was found to have suffered very much. Part of the inscription, once visible on the border, had gone, and so had Bacchus, but what was left was of great interest. There is, or used to be, a drawing of this pavement in the Winchester Museum. It was a matter of great regret that the Rev. G. Engleheart had left this neighbourhood. In this district were two great Roman roads, and there was much still to be done, if it could be done by competent people and without the strange feeling of jealousy which is often imported into such things. If they would pardon a personal reference, it was for this reason that he advertised himself as the local secretary for Hampshire of the Society of Antiquaries—not because he was the best authority, but because he was in touch with those that were. Things of interest we often passed over for want of a proper knowledge of the subject, while often things of little worth get magnified into importance. In the year 1897 Mr. Engleheart noticed in that field fragments of roofing, stone flue tiles and bricks, and in digging a trial trench near the edge of the road he made a remarkable discovery. He came across a cement floor with a shallow pit sunk through the floor, and in the pit a set of thirty-two pewter vessels buried intentionally. The vessels were of all shapes and sizes, large flat dishes, drinking cups, bowls and small dishes, all apparently for table use. Many were ornamented with an intricate geometrical pattern, incised by a wedge-shaped punch, and emphasised by being filled in with bituminous material serving for niello. Mr. Cecil Edwards, the lord of the manor, by whose courtesy they were there to-day, had shown drawings of these vessels, which were most fully described in "Archæologia," and also photos of another portion of a villa which was discovered about 50 yards distant, consisting of a small bath-house isolated and self-contained. Although there was not much now to be seen here, he thought it was of great interest to remember that they were standing on the very spot where about 1,600 years ago Roman families lived who were not only civilised but were Christians. The pewter was of the fourth century, so were a large proportion of the coins he had seen in the Andover Museum. There was abundant evidence (in spite of Bacchus in the Thruxton pavement) that not only here, but at Silchester and other parts of Southern Britain, Christianity prevailed. One of the dishes had a fish, a well-known emblem of Christianity, upon it; but more conclusive still was the Chi Rho monogram which appeared on another dish. He had been to the British Museum to see this dish, and was interested to notice that the monogram was not put on in its making but scratched on afterwards, by the owner most probably. How much they would like to know more about these people who lived in these villas and spoke Latin, and were, above all, Christians. How much they would like to know more about the succeeding century, the fifth, when the legions were withdrawn, and when, for a period of a hundred years, we knew nothing of the history of the land we live in.

The Rev. Father Davis suggested that the illustrated paper by Mr. Engleheart, published by the Society of Antiquaries, might be included in the club Proceedings, and Mr. Dale said he would mention the point to Professor Hearnshaw, the editor. Mr. Edwards said he had also come across in the neighbourhood remains of ancient British underground dwellings, but these were hardly traceable now.

The party were highly gratified by Mr. Edwards's courtesy and the interest he had displayed in their visit, and then proceeded on to Appleshaw, where luncheon was partaken of, and then on to Ludgershall, which is just over the Hampshire border. The ruined castle, situate within an earthwork or vallum of prehistoric times, was first visited. This ancient fortification, said Mr. Dale, is an example of a prehistoric site, selected in Mediæval times for a castle. There could, he thought, be very little doubt that these extensive earthworks were of the same character as those at Quarley, Danebury, Sidbury, Old Sarum and other places in that district, and, like them, it was a camp of refuge for the Flint folk and Bronze folk, who, centuries before the time of the Romans, lived in these great stretches of downland. About this place very little was known. He had found some notes upon it by his dear old friend the Rev. R. H. Clutterbuck, and upon them he drew. His information, he says, he takes from Aubrey's notes, corrected and enlarged by Canon Jackson, in 1862. At Domesday the manor was held by Edward, Earl of Salisbury, but seems soon after to have reverted to the Crown; at any rate by the time of Henry II. Ludgershall figures in the struggle between King Stephen and the Empress Maud, and it is probable that it was one of the strong fortresses built at that stormy time. We are all familiar with the scene at Winchester, when Henry de Blois at Wolvesey and Maud at the castle bombarded each other and half the city was in ruins. After Matilda's escape from the castle she fled along the Roman road and halted here in 1141, before going on to Devizes. Grose gives a picture of some of the pieces of the wall, showing round-headed fragments of Norman windows. The seal of Milo, of Gloucester, afterwards Earl of Hereford, was found there, and is engraved in "Archæologia." When Leland came there in 1546, he says the castle was "clene" down, but a lodge had recently been built out of the ruins, and still belonged to the Crown. The castle was part of the large grant made by Richard I. to his brother, John. King John was at Ludgershall in 1212. In 1228, Jollan de Neville, a justice-itinerant of Henry III., was governor. He is supposed to have been the compiler of the well-known Book of Fees called the Testa de Neville. In 1334 the castle was part of the maintenance of Philippa, queen of Edward III. In the reign of Edward VI. it was granted to the first Earl of Bedford, but appears very soon to have been the property of the Bridges family, ancestors of the Duke of Chandos. Sir Richard Bridges, of Ludgershall, who married Jane, daughter of Sir William Spencer, is buried beneath a fine monument in the church. He died in 1558. He was M.P. for Ludgershall in 1557.

Dr. Andrews, of Basingstoke, gave a few historical notes concerning the Empress Matilda, and then the visitors walked round the extensive vallum, and so on towards the main street of the quaint little town, in which the new is fast elbowing out the old, a fact mainly due to the establishment of the military camp about a mile away. The stump of the ancient market cross came in for curious inspection, and much speculation as to the figures that were carved on it but are now almost obliterated. A visit to the church, which has many historic associations and contains a fine monument, which appears to have been rather badly used, of Sir Richard Brydges and Lady Jane, his wife, circa 1558, was then made.

Tea was partaken of at the Crown inn, and at Ludgershall railway station trains were taken for home.

GARGOYLES.

IN his "Notre-Dame de Paris" Victor Hugo likens the building of Mediæval churches to geological formations. Every epochal wave of time adds its alluvium; every race leaves a fresh layer on the monument; every individual brings his store. It would be difficult to say when the gargoyle first made its appearance, says Mr. Charles de Kay in the *Architectural Record*. Perhaps in opposition to the view of Viollet-le-Duc it was coincident with elaborate stone structures, and in a less striking form belonged to the Romanesque before it blossomed in the Gothic. The Germans are wont to say "from the rain right under the spout" as an equivalent of our "from the frying-pan into the fire." Old towns like Goslar, Hildesheim, Rothenburg, still show open rivulets down the middle of the streets during rainy weather; the spouts are

Digitized by Google

still distributing the drainage of picturesque roofs, as of old, beyond the Bürgersteig, the burgher's stepping stone or primitive sidewalk, into the roadway. These survivals explain the origin of the spouts for rainwater rather than the gargoyle. But if we could see the streets of Mediæval towns exactly as they were before the age of Gothic churches, perhaps we should also detect here and there grotesque animals on the spouts carved of wood on such dwellings as ambitious burghers loved to ornament otherwise with carvings and pictures.

Nowhere more clearly than in the gargoyles of Gothic churches does one perceive that a wooden prototype has been repeated in stone. It is plain that a log bored or channelled lengthwise to form a waterspout has been finished in some eccentric shape—a chimæra, a harpy, a nondescript beast—and when required for a structure all in stone has been transferred to that material. Sometimes it is found that metal has been used where that does no harm to the artistic look of the structure.

At the same time, it is worth noting that we have no certain records of gargoyles until after the Crusades, and that fact leads us to the Orient for the fashion in gargoyles that meets us in the thirteenth century. Greek and Roman architecture are not without examples. But it is in the extreme Orient that we find exact parallels, in Ceylon, rainy Burma and Siam, as may be seen by the illustrations of gargoyles recently discovered on old temple sites and published for the first time this year.

There is something that appeals to the sense of fitness in these grotesques in Gothic and Buddhistic architecture when seen in connection with the rest of the sculpture. Taken by themselves, divorced from their subordinate positions, they strike us as a trifle coarse with the grotesquery of their distorted masks and muzzles. But seen in connection with the figures of Divine beings and saints as they stand on their pedestals under their canopies, the whole combining to make a façade such as that of Rouen or Chartres appear like an intricate field of lacework, the gargoyles form a contrast at once pleasing and in harmony with good sense; they are minor parts of a great intricate whole, and should not be thought of separate from the other sculpture.

False views of art often spring from this root of ignorance as to the relation that objects now isolated once bore to their original surroundings. Examples of this in everyday life near to hand are the Chinese and Japanese curios which have been so widely appreciated by our art collectors. Ever since the advent of "chinoiseries" to Europe the finest qualities of Chinese and Japanese art works have been misunderstood, because European interiors do not suit them; this lack of harmony continues to the present day.

But Europe and America have been as grievously at fault in Classic things, more particularly with regard to Greek sculpture, which has been imitated and subjected to surroundings for which the Greek prototypes were never intended. We still mount caryatids where they are not merely anachronisms, but have no function to perform of supporting a superincumbent mass or embellishing an upright member. We hang carved wreaths and apply masks where these have no meaning. We imitate the bad taste of former generations by representing an arch which has lost its keystone, and we place elaborate groups of carved marble in rooms that lack the spaciousness, the open light from the sky, the marble architecture and floral surroundings that belong to them.

The gargoyle had its due place in Gothic churches in connection with the Divine and human figures in sculpture and stained glass on the one hand and the floral and vegetal carvings on the other. These eccentric figures have their own part to play. They contribute to the sometimes heavy humour of Gothic art almost as much as certain faces and figures tucked away in the leafage of capitals within the church or under the seats of the stalls of the choir. Rarely, if ever, is satire expended on them, for they are apt to be too remote for an effectual girding at the pomposity of priests and monks—those perennial taskmasters and purse-bearers whom the architects and sculptors of the church edifices held very often in the deepest disesteem. They belong rather to the realm of the bestiary, the book of fables, and to the domain of minor supernaturalism, a very real land of the imagination, peopled with forms belonging to old, half-forgotten, but not entirely extinct, religions.

As the red-skinned Christians of Mexico were once found to have stuffed the inner part of the high altar at Puebla with their old idols, without the knowledge of their cruel civilisers, so did pagan Europeans slily introduce their discredited gods into the haunts of the new deities, enjoying the fun of getting the better of proud prelates who were ever ready to have them punished or even burned alive for devil worship. They also felt as did the submissive Mexican Indians that perhaps, after all, there might be some power left in the old demoralised gods, some uncanny virtue in their images, which it would be the part of wisdom to conciliate in case the saints were deaf, or otherwise too much engrossed to listen to their prayers. Cautious minds felt that the devil himself was too powerful a seigneur to exasperate.

In various odd forms the primeval worship of birds and beasts and imaginary creatures compounded of human and animal parts adheres to humanity long after strict logic has pronounced them and any belief in their efficacy absurd. That is superstition in its old crude meaning, including belief in warlocks, were-wolves, demoniac hunters, the evil eye.

In the ancient annals of Rouen we seem to touch the very beginning and genesis of the gargoyle in a strange creature called La Gargouille, which devastated the fair land of the Senones long before the term Normandy became the general appellation of the country thereabouts—a demon whose existence was celebrated if not demonstrated by curious rites that betray a pagan origin.

The gargoyle of Rouen was a very astute monster, who showed a partiality for young, soft-fleshed virgins, which one would scarcely expect in a creature so coarse of skin and with so violent a breath. For such a creature, with such a gullet, a Saxon pirate tanned by African suns and pickled by the brine of the Atlantic would seem a more savoury article of diet. One can conceive the gargoyle enjoying a Roman legionary in full panoply of arms, cracking a Roman knight as you would a nut. But tender maids were his pet specialty, and Rouen found it necessary to give him one from time to time in order to protect their husbandmen, flocks and herds. The staple of his human diet, however, was a meal of such men and women convicted of crime as Rouen could best spare, so that it became a practice to devote to the gargoyle prisoners incarcerated for one reason or another, despite the fact that by so doing the people were deprived of one of their chief sources of amusement, the decapitation, the quartering or the incineration of their fellow-man.

It was under Clotaire II., when Christianity was making slow headway against paganism in France, which still held its own among the folk. A holy man from Rome had taken up his abode in a neglected fane of the Druids, had cleansed it of the foul goblins of the old faith, and begun to declaim against the sons of Belial. The time arrived for feeding the gargoyle, and a deputation of the chief men was ready to take a noted criminal to the proper spot and leave him as a sacrifice. St. Romanus perceived the opportunity offered him. "Let me take him to the gargoyle," he exclaimed, "and if I can exorcise the monster with bell and candle, you, on your part, must promise to accept baptism at my hands and build a temple here to the one true God."

The men of Rouen had no great desire to enter the haunts of the gargoyle. They reflected that a Christian missionary was no ordinary dish, and the gargoyle might be mollified if, in addition to the criminal, they offered him a succulent foreigner. With their tongues in their cheeks and a reprehensible flickering of the left eyelid, they closed the contract with St. Romanus and watched him and the fettered criminal disappear among the great beechwoods on the other side of the Seine.

What was their amazement to see Romanus and the criminal return leading the gargoyle in captivity, bound by the stole of the saint, his fiery breath all gone, his long tail dragging piteously behind. Still terrible to look upon, the gargoyle was a danger no longer. Fastening him to a stake in the same square on which, centuries later, the Maid of Orleans was done to death as a witch, the citizens heaped many dry faggots and bundles of straw such as they used for thatch about the monster and saw him reduced to cinders—all but his head and scaly neck, which remained incombustible, owing to the fiery breath that used to issue thence. It was from this part of the dread gargoyle that wood-carvers of later days took the design for the spouts, which are condemned to emit cold water as a perennial jeer and flout against the creature that seared men with his red-hot exhalations. It was thence, according to this veracious chronicle, that the gargoyle took its name.

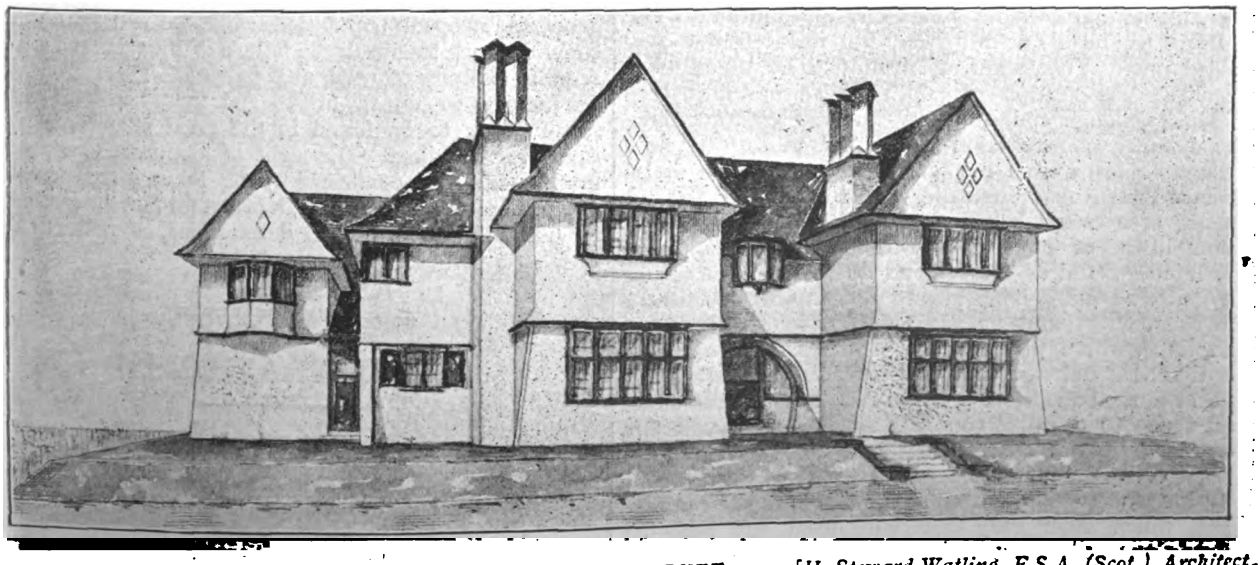
Ever after, in remembrance of Saint Romanus and his prowess, the good citizens of Rouen have been in the habit

Digitized by Google

of building a properly horrible dragon against Ascension Day and parading him through the streets. He is known in the feminine as La Gargouille, notwithstanding the fact that such malefactors are always of the male sex, and they burn him on the public square with ceremony and great merriment, although not allowed to include human beings in the sport. The burning of human beings, it is true, did not die out, but it was done separately and on the most authenticated grounds of heresy or witchcraft.

In this variant on the story of Saint George and the Dragon we have a confused remembrance of the early pagan methods of disposing of criminals among the Gauls. It was their practice to make the burning of criminals a popular spectacle. Giants and dragons large enough to be the cages for several victims were constructed of osier, and these huge effigies were carried about in triumph and finally burned with their human, living contents on a consecrated spot. Some such monster of willow-work and straw, which devoured criminals and was not averse to an occasional virgin as a *bonne bouche*, may well have lain at the bottom of the legend. A saint from Rome put an end to the gargoyle, which we must imagine as an osier image like the famous Tarasque of Tarascon. The criminal saved from certain death by the saint gives the clue. The gargoyle was a spectacular machine devoted to capital punishment and symbolised some ancient god of fire.

As such it takes its place among the goblins on the outer walls of Gothic cathedrals, degraded to base uses, but preserving a reminiscence of the old pagan days. The only parallel among the Greeks and Romans was the lion mask that decorated the roofs of temples or spouted water into the fishpond or bath. But that also can be traced back to superstitious origins, for the lion mask, like the mask of the Medusa and the head of the griffon, represented talismen to protect men from various ills. Pausanias mentions that Akroteros, a daimôn or genius belonging to the cortège of Bacchus, was remembered at Athens by a mask fixed in a wall. So we see that the same process was going on in Classic times, the souvenirs of old rustic religions clinging to the temple walls as decorations rather than idols. Akroteros was doubtless some local form of Pan, the old god degraded to a satyr who haunted the hill-tops, who in course of time was taken up and gathered into the general worship of Bacchus.



Gargoyles are an element in the love of nature shown by the sculptors and architects of Northern Europe during the Middle Ages, but they also reflect the supernatural side of nature worship which ran contrary to the ideas of Rome and Byzantium. In the long run the classicals prevailed, and the architecture which included and protected them, as a great forest includes and protects creatures of every kind, was stigmatised as barbarous and flouted by the word Gothic, and so had to disappear. That its force in the twentieth century is not entirely spent is clear: for religious and secular buildings are still designed on lines that are accepted as Gothic, though the rebellious, forceful spirit of the old builders no longer inspires them.

ITALIAN ANTIQUES.

A REPORT has been prepared by the American consul at Messina upon the regulations of the Italian Customs authorities affecting antiques, which are of special interest to tourists in Italy. All goods coming from Taormina in Sicily for shipment to any foreign port upon arrival at the Italian Custom house in Messina must be sent at the shippers' expense to the museum either at Palermo or Syracuse for examination by experts to discover if the cases contain any antiques. The declaration that they do not contain such articles carries no weight whatever. If an antique is found which comes under the law forbidding its exportation it is seized. If it is of a class that can be exported by payment of an export duty it is released when that requirement is complied with. If, however, this article be found in a package which was entered for exportation upon a declaration stating that no antiques were contained therein the shipper is subject to a fine which may amount to as much as 30*l*. The consul quotes a case in point, in which an artist who had lived at Taormina on his departure packed all his belongings and sent them to Messina for shipment. He declared the contents as household effects. When examined there were found numerous antiques of Italian origin but of little value, and which were not all purchased in Italy. The authorities decided that they could be exported upon payment of the duty, but that he must pay the fine for false declaration. For this reason it would be well for visitors to Taormina to be warned of the existing conditions. The antiquarian who sells a piece of old furniture will naturally not find it to his interest to inform his customer of the regulations, and therefore the consul suggests that the only safe method for the purchaser to pursue would be to stipulate that payment be only made when the bills of lading of the steamer on which his goods are shipped are placed in his hands. Complaints have frequently been made by purchasers who only too late discovered that even after they had paid for their goods they could not export them. The conditions at present are such that a person not conversant with the law may purchase a genuine antique from a dealer only to discover that the exportation of his purchase is actually prohibited, and his only recourse is to make a legal claim against the seller, which is a most expensive proceeding.

HOUSE NEAR NEWMARKET.

THIS house was erected last year on an estate near Newmarket, as a summer residence. It contains a lounge, hall, two reception-rooms, butler's pantry, kitchens and usual offices, ten bed and dressing-rooms, bath-room, and lavatories, a servants' hall and men-servants' room, and two bedrooms are now being added. The architect for the whole of the work is Mr. H. Steward Watling, F.S.A. (Scot.), of Kingsway House, Dovercourt, and Tavern Street, Ipswich; and the contractor is Mr. S. Rolfe, who is also building the stabling, motor-house and cottages.

HOUSE NEAR NEWMARKET. [*H. Steward Watling, F.S.A. (Scot.), Architect.*

NOTES AND COMMENTS.

THE committee who arranged for the testimonial to Mr. PHENÈ SPIERS last year intended to make some arrangement by which drawings of old buildings which were subsequently destroyed or altered should be preserved. Mr. SPIERS has assigned the money remaining as the nucleus for such a fund, and has invited a committee to assist him in organising and arranging this scheme. The authorities of the Victoria and Albert Museum have expressed readiness to make the drawings a part of the library collection, where they will be accessible to students. The committee invite architects to present drawings. The collection will comprise records of important public buildings, and of works by eminent architects down to the end of the nineteenth century; photographs of buildings which no longer exist, or which have been materially altered; and sketch books of deceased architects of repute. The project deserves to be generously supported, for it will be hereafter an advantage to have as many views as possible of buildings deposited in one place. Information respecting the proposal can be obtained from Professor LETHABY and Mr. R. WEIR SCHULTZ.

THERE is so much mystery about the ancient architecture of Mexico that every new discovery acquires peculiar interest. When the buildings in Yucatan were revealed to the Spanish invaders that part of the country was occupied by Maya Indians, and it was concluded they were the descendants of the original builders. On last Christmas Day M. DE PERIGNY found in the midst of the forests of Petan in Guatemala a town or settlement now called Rasun, in which there were more than thirty ruins of large buildings besides mounds which were constructed of earth and stone. They were all, he says, in the Maya style. There was greater simplicity than usual, few ornaments and hieroglyphics. It was impossible at the time to make a close investigation, but two of the buildings which stood apart he calculated as having heights of from 60 to 70 metres. Two days later he found in the district other ruins, including six large pyramids. M. DE PERIGNY has since explored the place again, and if possible he will in the winter publish a description of his discoveries.

THERE must be something peculiar in Irish air which makes union among its people an impossibility. The poet who described the country as "a heap of uncementing sand" was not a geologist, but he understood the character of his countrymen. Why, for example, is it impossible for the architects and builders of Dublin to be able to agree about conditions of contract? The subject has been under debate, but apparently a one-sided one. The following resolution by the Master Builders' Association reveals an Irish peculiarity:—"That although conditions of building contract have been under consideration for many years, we now regret to learn from the public Press that the members of the Royal Institute of Architects of Ireland have, at a recent meeting, adopted without discussion a set of conditions, without any consultation with the Builders' Association as to their views on a matter so vitally important to their interests, contrary to the custom and practice adopted in England and Scotland, where this matter was the subject of many conferences between the architects and builders prior to its mutual adoption. While willing and anxious at all times to carefully consider any proposals whereby equitable terms of contract might be agreed on, we respectfully decline to be forced to accept or sign conditions which are, in our opinion, inequitable and unfair, and which differ very materially from any accepted conditions at present in use in the United Kingdom." Although they are unable to agree with their countrymen, the builders announce that they are prepared to accept the conditions agreed on between the Royal Institute of British Architects and the Association of Master Builders of Great Britain and Ireland. In other words, anything is acceptable so long as it is not native. Perhaps the true cause of the difficulty arises from the scarcity of builder's work, and the blame is cast on the architects.

THE British vice-consul at Tangier appears to be sanguine that Morocco is a promising field for all connected with building material. He points out that British manufacturers will find it well worth their while to study carefully the Morocco market and the native tastes; they might do worse than follow the lead of some of the most successful of their rivals, and send out expert travellers to find out exactly the type of article which is likely to find most favour in this market. Flooring and roofing tiles, cement and gypsum found a profitable market, and were imported to a considerable extent. Hardware formed another large item in the French import trade; large quantities of iron bars and girders, machinery, steel girders, bars and sheets, tools, &c., were received. Belgian merchants seem to have thoroughly grasped the possibilities for profitable trade in this market, and trade under this flag has nearly trebled during the year. Cement, iron girders, cloth, china and glassware are the chief items of Belgian industry which have now made their appearance in this market in considerable quantities. Imports from Spain show a great advance; the most important representative items of Spanish industries on this market are bricks and tiles, cement and gypsum, furniture, wines, fresh fruit and vegetables. As regards cement, the Belgian merchants hold the market with a cheap manufacture. British potters should be able to compete successfully in the brick and tile markets. Trade in furniture has increased from 9,752*l.* in 1904 to 12,887*l.* in 1905, and there is every prospect of further expansion owing to the growing European population; the furniture required is of a cheap and light description. With the favourable result of the Algeciras Conference it is to be hoped that a new era will begin for industry of all kinds; harbours and breakwaters must be built, perhaps at no distant date roads may have to be made. There is sure to be a great demand for tools of all sorts and descriptions, and all the many conveniences required for a modern town will be in demand if, at any rate, the more important of the coast ports are to be modernised. British firms might find it worth their while to send out from time to time expert travellers who can see for themselves the possible openings of the future. The imports which show most progress point to the increasing stimulus in the building trade and rapidly growing European population, while the exports which show declines testify to the failure of the rains and consequent scarcity of corn and pasture. The reason of the increase in cement, bricks and tiles, hardware and furniture, is to be found in the great stimulus experienced in building. The right of foreigners to acquire land having been confirmed by the Powers represented at the Algeciras Conference, it is certain that the demand for building material of all descriptions, as well as for furniture, will increase considerably.

THE CHARING CROSS ROOF.

THE report of Major J. W. Pringle on the circumstances attending the fall of part of the roof of the Charing Cross terminus on December 6, 1905, has at last appeared. It is dated March 25. After describing the construction of the roof and reporting the evidence of witnesses, the following remarks about the cause of the accident are given :—

Owing to the great mass and weight of the falling *débris*, and to the necessity for safeguarding the remainder of the roof, it was not until midday on December 9 that it was found possible to trace the tie rodding of the fallen principal throughout its length. It was then found to be broken at one point only, viz. in the third panel from the west, about 13 inches from the third coupling joint.

The evidence proves beyond a doubt that the snapping of this particular tie-rod was the immediate cause of all that followed. The west wall, without the support of arched buttressing (as in the case of the east wall), yielded eventually to the severe thrust from the loosened bow of the first principal. But the time occupied—twelve minutes—shows that not only did the wall offer great resistance to tearing apart, but that much work had to be accomplished in breaking away from the hold exercised on the crippled principal by the lines of purlins, which were stiffened by intermediate lattice girders, and in overcoming the resistance to distortion of the main rib itself.

Turning now to the broken tie-rod, the eastern end in falling buried itself like a bayonet 2 feet in the ground. This end was unearthed on December 7, but the fractured surface was already rusted and corroded, and told no tale. The western end fell on the timbering of No. 2 platform, and was covered with corrugated sheeting and fallen débris. It was thus fortunately preserved from the effects of damp and dirt. I saw it within a few minutes of the time it was uncovered on December 9. The surface of the fracture was

then as clean and fresh as could be desired. The appearance was typical of a fracture at a badly formed weld. Approximately two-thirds of the line of fracture is at an angle of about 56 degs. with the axis of the bar, whilst the uppermost third is vertical. The surface of the fracture may be divided for the purposes of description in three parts (*vide* sketch). A belt A about an inch in width (along the vertical line of fracture) extends round the upper and northern half of the circumference of the bar; over this area the fracture had the bright crystalline appearance of iron suddenly torn apart. In the centre of the bar can be seen a flaw or pocket B, with a smooth fire-skin surface, surrounded by fragments of dark-coloured ash ; this area is, roughly, circular in shape, with a diameter of 1½ to 2 inches. The third portion C, mainly consisting of a belt 1½ to 2 inches in width round the lower and southern half of the circumference, was generally discoloured and corroded, with a spongy appearance common in ill-formed welds, but here and there small spots and pin-points, especially round the circumference, of clear crystalline appearance, showed signs of freshly fractured metal.

As set forth in the evidence given by Sir John Wolfe Barry, Sir Benjamin Baker and Mr. Kirkaldy, there can be no doubt that the fracture occurred at a weld in the bar ; that the core of the bar B had never united, and had never possessed any value to resist tension ; that the surfaces of the area C had united, probably indifferently, except in the immediate neighbourhood of the circumference ; and that the flaw, which originated in central pocket B, had gradually extended outwards over the area C under the severe tensional stress to which, owing to the want of union in the centre, the bar had been so long subjected. The isolated bright spots and specks over the area C show that immediately before the bar snapped there was good metallic contact at these various points, as well as over the whole area A.

The total area of metal which was doing work in resisting tension at the moment when the bar broke may be roughly estimated at about one-third of the whole area, or from 5 to 6 square inches. The total calculated stress in tension was 81.5 tons, or from 13 to 16 tons per square inch of available metal. Taking into consideration the eccentric position of the bulk of the available area A, it will be admitted that so high a stress would be certain to cause rupture the moment the threadlike points of contact in the area C parted.

The normal stress in tension, due to weight of roof only, on this bar was about 61.5 tons. The additional stress brought to bear by weight of staging, &c., necessary for repair work, was thus 20 tons, or nearly 30 per cent. more. The bar was subjected to this greatly enhanced stress for three weeks continuously before it failed, and prior to the middle of November had for four months been undergoing a stress 15 to 20 per cent. greater than would be due to weight of roof only. It is clear therefore, I think, that the immediate cause of failure was the additional weight necessarily imposed on the principal in connection with the repair work, and it is reasonable to suppose that the failure would not have occurred at the moment it did if the tie-bar had been subjected to stress from weight of roof only. It is equally clear that the weight of staging, &c., merely accelerated the failure, which, judging from the appearance of the fracture, was bound to occur at a comparatively early date. That the flaw was growing is plain from the fact that the bar successfully withstood equally high stress imposed for a long period in the year 1898, when staging of similar weight was used for repainting work.

Sir John Wolfe Barry and Sir Benjamin Baker state in their evidence that it is probable, judging from the procedure taken in the case of the New Street station roof, Birmingham—the prototype of the Charing Cross station roof—that the tie-bars were hydraulically tested before erection with a stress of 9 tons to the square inch (= 144 tons on this particular bar), and that every examination and test of the ironwork was made which the skill and care of engineers at that time could devise. Notwithstanding, the original bad flaw in the weld of this bar remained undetected.

Once the roof had been erected, the possibility of a serious flaw being in existence, and growing in size until it caused a failure has never before been recognised. This is the first known case of a tie-bar in a contained arch breaking under a reasonable stress. It would not, I think, have occurred to any engineer to make any special examination to discover the possible existence of such a flaw. Periodical examinations would be made to determine the extent of general repair work necessary. At such periods the visible weakening or loss of metal due to rust or corrosion could be gauged, the condition of the bolts and fastenings determined, and necessary action could be afterwards taken to clean and repaint ironwork, renew bars that were much decayed and replace fastenings. But, as given in evidence, no practical method exists of detecting an interior flaw in a bar of this size under high tension unless some sort of fissure in the outer surface was apparent. No apparent fissure could, I think, exist under such stress without the bar snapping immediately. The evidence of Mr. Kirkaldy on the difficulty he experienced in his works of discovering and proving the existence of welds at both ends of these tie-bars, shows that the welding on the surface of the bars was very well executed.

I have not neglected to consider the possibility of other causes which might wholly or in part have occasioned the failure of the roof. I propose now to deal with the principal theories which have been suggested.

(*a*) Reduction of strength by rust or corrosion, consequent upon want of maintenance. The tie-rod that broke had originally a diameter of 4½ inches, and a sectional area therefore of 15.9 square inches. Most of the paint which was laid on in 1898 had perished, and the surface of the bar was pitted considerably by rust. But from careful measurements made by Mr. Kirkaldy the mean diameter of the bar after fracture was found to be 4.4 inches (area = 15.2 square inches), so that the actual loss of metal amounted to 4.4 per cent. of the original area. This is an insignificant loss, and cannot be held accountable for the failure.

Digitized by Google

(*b*) Fatigue of material, due to long-continued stress or vibration set up by the motion of trains, &c. There is no evidence to prove this, but rather the reverse. The test pieces cut out of the bar by Mr. Kirkaldy close to the fracture broke under a tensional stress of 20.6 tons per square inch, and showed a contraction of area equal to 40 per cent. The iron had the appearance and character of new metal.

(*c*) Wind pressure. The afternoon of December 5 was calm and still. The fact that a fortnight previous to the failure, when the full weight of the staging was imposed on the principal, there was half a gale of wind blowing, and that failure did not then result, goes to prove that the effect of the wind on a roof of this shape, sheltered by high walls, is very much smaller than has been generally estimated.

(*d*) Disturbance of foundations, due to excavations in connection with the tubes of the Baker Street and Waterloo Railway. These tubes are nearest to the west wall of Charing Cross Station in Northumberland Avenue at the junction of Whitehall Place. The eastern tube is about 125 feet horizontally from the station wall. The extrados of this tube (11 feet 8½ inches in diameter) is 56 feet below the ground level, and 10 feet below the upper surface of the London clay. Any disturbance due to the excavation for these tubes would in the first place have affected the station viaduct, which carries the walls of the station. It would at once have shown itself in visible cracks in the arching of the viaduct. No such cracks have appeared since 1900, when the tubes at this point were constructed. No subsidence either has been experienced in the walls of the Avenue Theatre, which lies directly between the station and the tubes. There is therefore nothing to support this theory.

(*e*) Absence of buttressing to the west wall of the station. The design of the roof, as has been stated in the description, was that of a contained arch. So long therefore as there was no failure in any integral part of the design vertical pressure alone was brought to bear on the walls supporting the roof. That they were strong enough to stand this vertical pressure is, I think, proved by the fact that they carried the roof for so many years. Sir John Wolfe Barry states in his evidence that the buttressing to the east wall was decided upon after the roof had been erected, as a safeguard to the possible effect of wind pressure from south-westerly gales upon the western wall, which was at that time much more exposed than in the present day. From the point of design, at the time the roof was constructed, it cannot be said that buttressing was necessary, nor in fact would such buttressing have prevented this particular tie-bar from failing in the way it did.

I come to the conclusion, therefore, that the fall of the roof was brought about by the breaking of the tie-rod in the third panel from the west of the main principal nearest to the wind-screen. The fracture occurred at a weld, by reason of a flaw in the welding. This flaw, commencing in the heart of the bar, had gradually extended outwards. The additional weight of the temporary staging was the immediate cause of failure, but as the total stress in tension at the time of failure on the whole sectional area of the bar did not exceed 5.13 tons per square inch, I find that, for the necessary purposes of repair, such a stress was not in any way unreasonable, and could not be anticipated to cause danger of failure. Lastly, I do not consider that any reasonable precautions were neglected by the engineer or his staff in charge of the roof, or that it was possible by any practicable method to have discovered the flaw in the tie-bar.

The particular lessons to be learnt from this sad accident are as follows:—

1. That in old iron roofs of similar design, more especially where welded bars of any size have been used, there is danger to be guarded against of concealed flaws, which may grow in size under continued tensional stress, although in itself that stress may not be exceptional.

2. That unless additional security be afforded by the duplication or strengthening of the main tensional members there is possible risk of failure.

3. That where such risk of failure exists, it is necessary to consider whether the walls supporting the roof are in themselves sufficiently strong to resist the thrust which such failure will bring on them, and if not to strengthen them.

Mr. E. P. Gibbs, Kingsbridge, has been elected district surveyor of South Herefordshire. There were seventy other applicants.

LIVERPOOL CATHEDRAL.

THE annual meeting of the Liverpool Cathedral general committee was held last week. The report congratulated the subscribers upon the completion of the first portion of the work. The foundations of the cathedral choir, lady chapel and chapter-house were finished by the contractors in the month of April. On December 31, 1905, the total amount of subscriptions promised to the cathedral fund amounted to 250,790*l.*; of this 22,717*l.* remained to be paid. The interest earned amounted to 13,611*l.* 16*s.* 5*d.* Of the subscriptions 27,031*l.* was contributed for special objects, leaving available for the construction of the cathedral and of the lady chapel 237,370*l.* There was expended down to December 31 last, in the purchase of the site, legal and general expenses and in the construction of the foundations, 64,033*l.* A further sum of about 12,000*l.*, in addition to the sum expended down to December 31, 1905, was then required to complete the foundations, leaving 161,000*l.* available for the building of the cathedral and lady chapel. It is estimated that the portion of the cathedral now being proceeded with, inclusive of the lady chapel, will cost about 240,000*l.*, so that to complete these there will be required in round figures further donations to the extent of 80,000*l.*, in addition to the 136,000*l.* available on general account and the 25,000*l.* given towards the erection of the lady chapel by the Earle and Langton families. The portion of the building which the committee are now undertaking comprises the choir, the lady chapel and the clergy vestries, and they have accepted the tender of Messrs. Morrison & Sons, of Wavertree, for the erection of this portion, which will be proceeded with at once. This will enable Divine service to be conducted, and place the committee in a position to call upon the Ecclesiastical Commissioners for the property which has been set apart for the endowment of the chapter. Towards the building of the chapter-house the Freemasons of the province are generously contributing 10,000*l.* The committee most gratefully acknowledge the many handsome gifts presented during the past year. Among these they may mention the choir stalls, bishop's throne and choir pavement for the main building; and for the lady chapel the reredos, the organ, the Holy table and ornaments, the flooring of the sanctuary and several windows. Under the will of a Liverpool gentleman a peal of bells has also been provided for, and they venture to make an urgent appeal, not only for the 80,000*l.* required to complete the first portion of the work, but for such further funds as would justify them in undertaking a further portion of the great design on which they have embarked. Subscriptions are not required to be paid in one sum, but may be spread over five or seven years. They have received intimation of some bequests, and they venture to hope for further contributions in this form.

IRISH LABOURERS' COTTAGES.

THE president of the Royal Institute of the Architects of Ireland, Mr. W. M. Mitchell, writes in reference to the Bill for granting further subsidies towards the erection of labourers' cottages. He says:—Some of the provisions contained in this Bill are likely to affect injuriously the interests of Irish architects. The Council of the Royal Institute of the Architects of Ireland have the proposal to issue stereotyped model plans under their consideration, and they have come to the conclusion that unless these plans are placed in the hands of competent architects they will prove of little advantage. It is evident that the attempt to make all these buildings conform to one or two uniform types of plan must fail to produce satisfactory results when the variety in the character of the sites is taken into account. Although the buildings themselves are of simple design, it will need the skill and resourcefulness of a qualified practitioner to obtain the best results as regards aspect, access of sunlight, &c., in each case. For these reasons the Council are of opinion that these model plans should only be treated as guides as regards the accommodation required, dimensions of rooms, cost and such like data, and that they need not be followed with absolute rigidity, but that a reasonable discretion should be allowed, so as to adapt them to any particular site.

Moreover, the Council believes that many of the cottages already built have been designed and superintended by utterly unqualified persons, and are in consequence creditable to no one concerned in their erection. We feel strongly that the employment of such persons by rural district

Digitized by Google

councils for the sake of a paltry saving of fees is most reprehensible, and frequently results in the production of ill-designed and ugly structures, in which little or no consideration is given to the health and comfort of the inmates.

The Council would, therefore, gladly welcome the addition of a clause to the Bill which would enable the Local Government Board to insist on some kind of qualification on the part of those employed to supervise these buildings. If this were done we believe the results would be very satisfactory, and that we should witness a vast improvement in both the comfort and the appearance of future cottages. The mistakes which have been made in the past would be avoided, and an intelligent design and skilled supervision secured.

The extra cost of such a welcome change would be very small indeed, and could be possibly met by reductions in the legal expenses, which seem to me (I speak as a layman) to be very high at present.

FERRO-CONCRETE.*

THE employment of ferro-concrete dates back many years. When at first the theory was advanced to use iron in combination with concrete in order to increase the stability of the latter, a good many engineers were doubtful as to this new method of construction, and assumed a reserved attitude. When, however, the very simple experiments by gradually attained improvements resulted in serviceable construction, opinion no longer diverged, and the employment of ferro-concrete increased in number and magnitude as time progressed, and it asserts now a most prominent place in the construction of buildings. In the near future a further progress may be predicted for this building system. There may of course still prevail apprehensions as to the nature of the new method, but most of the theorists are cured of their incipient prejudices. The actual merits of reinforced concrete constructions can no longer be denied.

Ferro-concrete, by means of its adaptability to all forms and its manifold uses, enjoys the preference to either of the materials which form its constituents. Masonry being too massive for many purposes, and iron structure too clumsy, both can be replaced with great advantage by the employment of reinforced concrete. It was an open question to what changes the metal was subjected while in use, whether the cohesion was sufficient to withstand repeated shocks, whether rust did not injuriously affect the iron and otherwise influence the concrete, and whether fluctuations in the temperature did not exercise a destructive effect on either material. The practical experience gives a most satisfactory answer to all these questions.

Another important question that has been troubling the theorist's mind from the very beginning remains still to be solved, namely, what is the degree of firmness of armoured concrete? The solution of these problems is extremely difficult. Put all theories aside, and a fact comes to our aid which is of greater moment than all demonstrations. We have methods of building by means of which constructions of every description can be and are erected by observing the necessary care in the execution, such buildings not only confirming the system, but exceeding the expectations as to the purposes for which they are built. There are engineers who contend that for the computation of ferro-concrete no formulæ can be determined. This may, to a certain extent, be true, but all the same the latest investigations have brought us nearer to that end, and such formulæ have now really been laid down and proved its usefulness.

For a century iron has partly formed the material for the construction of bridges, and for about sixty years iron girders have been employed for the same purpose. Disappointments and accidents did not allow the mistrust in the iron constructions to die away; but all these doubts did not daunt the engineer to press forward with the iron construction, and it can safely be said that the same has now developed into a great extension. As regards the dimensions of the pieces used then, more or less accurate formulæ were framed by experience, and the inventors did not trouble about anything else, because they had all confidence in these formulæ until such time arrived when, as several accidents happened, distrust against this construction reappeared. In spite of these mishaps, nobody thought of giving in; it only had the effect that the engineers tested the iron construction of the bridges over again, and through their testing and examining operations many mysteries were unravelled. Similar developments have taken place with ferro-concrete. While engineers were doubting and scientists calculating, practical men continued to employ reinforced concrete and to develop its potentialities. It is due to them that from the experience gained new facts were put forward. We have reached the point at which the doubt is being transformed into absolute confidence.

It is a common occurrence that nothing is more dangerous to a new invention than the same being only half known, and nothing can more impair the progress of a new system than ignorance. People either do not know the nature of a system or fail to judge its development.

At the present time things look different with ferro-concrete. The competent engineer is cognisant of its principles and various uses, and further knows how to judge of its advantages and disadvantages without prejudice.

Under the term "Reinforced concrete constructions" all those works must be included which are made of Portland cement, concrete and iron in such a manner that both materials intimately connected with one another can jointly exercise a statical effect against external forces. The theory is based upon the fact that the concrete resists compressive forces, while the iron, on the other hand, bears the tensile stress, thereby considerably increasing the otherwise limited tensile strength of the concrete.

The advantages of the ferro-concrete constructions, as compared with ordinary constructions, and the statical co-operation of the two otherwise so unequal materials are based upon the following fundamental qualities of the same:—

1. The concrete completely protects the enveloped iron against oxidation.

2. The adhesion of the Portland cement to the iron is very considerable and nearly equal to the shearing strength of the concrete.

3. The co-efficients of linear expansion through temperature are nearly equal.

4. When the iron surrounded by Portland cement concrete is subjected to a tensile stress, the expansion of the iron does not injure the concrete, as the latter expands with the iron and owing to its elasticity recovers its former condition without, as above stated, its strength being impaired in the smallest degree.

From the experiences gained by the Monier system, it is known that a safe protection against rust and a sufficient adhesion can only be obtained if the proportion of the mixture of the concrete is not too meagre, and if such an amount of water is added that the so-called plastic state of the concrete is obtained. It must be observed that the reinforced concrete on account of the embedded iron and the comparatively small body of the concrete cannot be rammed so well as is the case with ordinary concrete. I take as the lowest limit for the mixture constituents 1 to 6, especially with regard to the higher compressive strength of a richer concrete, as in all reinforced concrete constructions a high compressive strength of the concrete is imperative. As regards the adhesion of the concrete to the iron, 650 lbs. per square inch, being the result of exhaustive experiments by Professor Bauschinger, is generally accepted. This value, however, can in no way be regarded as normal. Through the latest experiments it has been proved that the adhesion of the embedded iron bar ceases when the strain in the iron exceeds the limit of elasticity. The adhesion of the concrete naturally varies proportionate to the diameter of the iron. The highest figure or values for the adhesion will be obtained from such bars as are not embedded too deep in a concrete body, so that when pulled out the tensile strain does not exceed the elastic limit of the iron.

In the following table the results of my own tests regarding the power of adhesion of the concrete to the iron with different proportions in the mixture and with various percentages of water are shown, expressed in pounds per square inch, namely:—

Percentage of Water Added.	1 : 1	1 : 2	1 : 3	1 : 4
10 per cent.	217	274.5	274.5	375.5
15 per cent.	664.5	708	578	549
20 per cent.	404.5	404.5	361	361
25 per cent.	322	433.5	322	346.5
Percentage of Water Added.	**1 : 5**	**1 : 6**	**1 : 7**	**1 : 8**
10 per cent.	433.5	390	230	173.5
15 per cent.	303.5	274.5	217	144.5
20 per cent.	173.5	173.5	159	101
25 per cent.	115.5	173.5	129.5	101

* A paper by H. Kestner, read at a recent meeting of the Institute of Mechanical Engineers, Johannesburg.

Digitized by Google

The figures give the average result of only two tests, and can therefore not claim to be absolutely accurate. All the concrete bodies cracked when the iron bar was pulled out, so that one is justified in stating that with larger concrete bodies or through the additional reinforcement by stirrups, which would prevent the cracking and breaking, a considerably greater strength or adhesion could be gained.

The adhesion is limited by the shearing strength of the concrete. Although the strength of the former exceed in point of fact the latter, a test can give no other result, because the iron in such a case would be pulled out together with a thin cover of concrete.

It is proved by tests that the coefficients of linear expansion for iron and concrete are nearly equal. In the earlier history of ferro-concrete constructions great stress was laid upon the equality; the knowledge of to-day, however, shows that a small difference in the linear expansion would not matter much. Considering the adhesion and the great elasticity of the concrete, the difference in the linear expansion would be counteracted by small internal strains for the usual differences in the temperature. Through comprehensive fire tests already made it is proved that a disconnection of the iron and the cement mortar, which might become dangerous to the stability of the structure does not take place, not even under a very high temperature or quick changes through water being poured on. The reinforced concrete structures, owing to their being bad heat conductors, are not so much affected by the heat as the ordinary iron or steel structures.

The fourth fundamental quality of concrete is its elasticity when used in connection with iron, which would have been anticipated much earlier. The first experiments for proving that elasticity were only made some years ago by Considerć. It was already known that cracks in the concrete became visible only under the high strains the reinforcement was exposed to. Even the linear expansions of the concrete were measured, and with the assistance of the modulus of elasticity for concrete the highest tensile strains were calculated, which were found to amount from 750 lbs. to 1,000 lbs., and even 1,445 lbs. per square inch, while the ordinary concrete did not show more than from 175 lbs. to 220 lbs. per square inch. The tests made by Considerć were carried out with prisms of a square section of $2\frac{5}{8}$ inches side and $23\frac{3}{4}$ inches in height, these prisms being reinforced by round iron bars on the side where the tensile strain was expected. The loading on the prisms was done in such a manner that one end of the same was fixed and the other end was subjected to a bending movement, which was equal to all cross-sections. The elongations of the sides where the tensile strains set up were measured under the increasing load. The proportion of the mixture was 1 : 3; the reinforcement consisted of three round iron bars of $\frac{1}{16}$-inch diameter. Several prisms were left without reinforcement for the purpose of comparison. With one of the prisms the bending moment was increased to such an extent that on the side of tension elongations of $\frac{1}{10}$-inch to the yard could be determined. Then a moment being 44 to 71 per cent. of the first exercised moment was repeated 139,000 times, the prisms being every time reduced to the unloaded state. These repeated strains showed elongations of $\frac{1}{50}$-inch to $\frac{1}{20}$-inch to the yard. Small concrete bars of a cross section of $\frac{1}{2}$-inch by $\frac{5}{8}$-inch were cut out of these prisms, and were again subjected to bending. This experiment showed the strength of these concrete bars to be surprisingly high and nearly equal to the strength of fresh mortar. Through parallel tests with concrete prisms without reinforcements it was determined that the elongation at the breaking point varied from $\frac{1}{214}$-inch to $\frac{1}{127}$-inch. One must therefore conclude that in a body of reinforced concrete the iron affords to the concrete the capacity of allowing a much greater elongation without breaking than concrete without any reinforcement. Considerć explains these different qualities in the following way:—As is generally known, a metal bar, when subjected to a tensile stress, extends at first symmetrically along its whole length; with increasing tensile strain it contracts at a certain point, where it then undergoes very considerable local elongations. If thus the elongation between the ends measures about 20 per cent. it is in reality about ten to fifteen times greater near the point of breaking. Assuming now that the state known as contraction were to occur also with the cement mortar, then the elongation measured between the ends of the test pieces would only be an average elongation and the mortar would, in fact, be capable of allowing greater linear expansion. In the ferro-concrete constructions the limit of elasticity in the iron is considerably higher than that of the concrete. Under the stress of the tensile forces the iron will still exhibit symmetrical elongations over the whole length when the cement mortar already begins to contract at a certain point. But the adhesion causes the concrete to elongate with the iron and in the test piece throughout, the concrete will undergo the utmost strain it is capable of, and the rupture will in fact occur only with such elongations (measured between the ends), which are considerably greater than in bodies without any reinforcement.

The explanation given by Considerć is very comprehensible, if the contraction in the cement concrete is really in existence. In order to prove this one must observe the elongations of the test pieces over short sections during the tensile applications of the tests, when it will be noticed that the various sections have no uniform elongation over the whole length. In respect of these bending tests for the division of forces of the iron and concrete, calculations were made by Considerć which showed that the concrete possessed no greater tensile strength than was proved with ordinary prisms. This calculation, however, was not correct in all details, and Considerć therefore made fresh tensile tests with reinforced concrete prisms, which can now be considered as conclusive. Mortar prisms of a square cross section of $1\frac{7}{8}$-inch side equally reinforced with four wires of $\frac{1}{16}$-inch diameter were subjected to a direct tension, and Considerć measured during the loading the elongation of the reinforcement as well as of the mortar. The experiment proved that the elongations were in all cases practically the same. By means of the modulus of elasticity of the reinforcement, together with the measured elongation, the part of the tensile force taken up by the iron could be calculated, and the figure resulting from the remainder of the tensile force divided by the contents of the cross-section of the concrete indicated the tension of the mortar, to which was added its elongation.

In summarising the foregoing results one cannot but recognise the fact, so important to the comprehension of the statical co-operation of both materials, that concrete, if connected with iron, is capable of great elongations; from a certain elongation, however, the strain in the concrete will not further increase. The greatest elongation of the concrete is $\frac{1}{14}$-inch to the yard, equal to a tensile strength of 13 tons per square inch of the iron.

Considerć puts the tensile strength of concrete at 140 lbs. per square inch.

The theoretical investigation of ferro-concrete structures has also shown that the position of embedded iron in the concrete cannot be arbitrary, if the really existing tension be in accordance with the results of theoretical investigations. To satisfy these results it is evident the greatest care must be taken and the greatest skill exercised in mixing, filling and ramming the concrete so that the several parts of the structure may satisfy the theoretical conditions.

The choice of iron for reinforced concrete is most important, because the iron has to take up the tensile stress which is so dangerous to the concrete.

The iron is usually chosen from those samples which are easily obtainable, viz. rod malleable iron, such as O iron, T iron, + iron, □ iron.

Considerable economy will be effected by the judicious selection of material—*i.e.* iron or steel. At first engineers were restricted to iron alone, but at the present day steel is added to the selection, and since the tensile strength of steel is much greater than that of iron it is evident that the cross section, when steel is used, can be less than when iron is used. Softened steel is now used by most concrete-builders.

Where the concrete is only in moderate tension, iron may be used in the reinforcement; but in a structure which will have to carry a very heavy load steel should invariably be employed. A French engineer who has conducted experiments in ferro-concrete with great success, and to whom all concrete-builders are indebted for his valuable deductions, lays it down that where steel replaces iron the cross section can be diminished by one-tenth.

The shaping of the iron must be done on the site of the work, both in the cold state and heated state. A field forge will be found convenient for this purpose on account of its portability.

If columns are passing through and supporting different floors, the round irons in the columns are fitted at the ends with coupling boxes to which successive girders or bressummers are attached. If great strength is required, as, for instance, in reservoirs, then the irons must be united by welding.

Digitized by Google

Engineer Coignet, the builder of the Château d'Eau at the World's Fair in Paris, did the welding by high-volted electricity.

Quick-setting cements are rarely used in armoured concrete. Many builders will at first sight think that these are the cements which should offer an advantage, because supporting timbering can be removed at an early date; but quick-setting cement is weak from a liability to crack, and therefore unsuitable. Further, in using quick-setting cement only small quantities of concrete can be prepared. It is therefore evident that slow-setting cement has a double advantage as a binding material. It is stronger, and can be prepared and used in large quantities, which is essential on external works.

The sand to be used in concrete should be composed of both coarse and fine material. It need not necessarily be quartz sand; it may contain lime, but, of whatever kind, the sand must be sharp and well washed and be capable of withstanding a heavy crushing force. Sand or grit which contain loam or organic matter should be excluded, as the textures of the grit and sand differ considerably.

I wish to call special attention to our tailings on the Rand. These tailings or slimes are really not the best material for the making of concrete, mostly on account of the fine quartz dust contained in them. Should tailings be used, this fine dust must be removed, either by sifting or washing. It is natural that this fine quartz meal will ball together in the course of mixing, and the fine particles of these balls, which stick together through the water only, cannot be covered with cement. Therefore I do not consider it advisable to use the tailings unprepared.

No perfect formulæ can be given for settling the proportions of the mixture. Therefore the only way to decide on this point is to conduct experiments, but as experiments entail expense, they can as a general rule only be resorted to where extensive works are being executed.

In order to settle the proportions it is necessary to determine the hollow space between the screened material. To do this fill a measure of known capacity with the material, then add water until level with the surface of the material. The quantity of water so added will consequently equal the hollow spaces.

As an example, the filled space is found to be 0.525 cubic yards and the hollow space 0.475 cubic yards.

The hollow space must now be filled with the binding mortar. The greatest skill and care must be brought to bear on the mixing of this mortar, especially as to the selection of the most suitable proportions (*i.e.* cement to sand).

Consideré has deduced from his experiments on the setting of concrete both in air and under water the following interesting facts:—In the case of concrete under water the particles of the concrete continue to expand for a period of over three years, and this expansion exceeds the expansion of iron. Consequently the iron retards the expansion of the concrete; this retardation causes the appearance of compression marks in the concrete, which are greatest close to the iron, and diminish as the distance from the iron increases. Thus in ferro-concrete setting under water there exist artificial forces, which elongate the iron and compress the concrete. These artificial forces have a beneficial effect so far as the strength of the structure is concerned, for the great danger to the concrete lies in the tensile stress caused by the load.

Concrete setting in air behaves in an entirely different manner, for the particles of the mortar contract. The contracting force will evidently be equal to a tensile force sufficient to maintain the concrete in its original dimensions; but this force continually increases during a period of three years. The force preventing the concrete from contracting increases as the cross-section of the iron increases, because the resulting force obtained from the composition of the resistance to compression of the iron and the force obtained from the tensile stress of the concrete while contracting will more nearly balance each other. And as the load causes a tensile stress in the under-side of the iron, and the contracting force of the concrete causes a compressive force, these two forces tend to neutralise each other. But as the force caused by the contraction of the concrete acts as well on the upper surface of the iron, when the iron is of the full depth of the concrete, as in floor-joists, it brings the iron into a very great state of compression at its upper edge; so that the good this force does the bottom edge of the iron is counteracted by the undue compression it causes in the upper edge.

Now it is evident that if the cross section of the iron be small and the contracting force of the concrete be great enough a fracture may occur, because the compression in the iron caused by the contracting force of the concrete, added to the compressive force caused by the weight, may give a resultant sufficient to neutralise the iron.

Also, if the cross-section of the iron be great the iron will successfully resist the contracting force of the concrete. A tension may therefore be caused in the concrete which will exceed the limit, with the result that a fracture occurs.

The tendency to fracture is removed by using a suitable quantity of binding mortar and attending to proportions of cement to sand. It is therefore necessary to take the proportions of cement and sand to suit the strains which the concrete will have to withstand and the conditions it is expected to fulfil.

For piles, caissons, tubes, blocks, &c., which first have to set in air and then be deposited under water, a continual sprinkling and a protection against the sun and wind after manufacture are to be recommended.

The strength of the different concretes depends on the following conditions and proportions of materials:—Amount of water used, temperature, mixing and ramming. Even by use of suitable materials an inferior concrete will be obtained, if the mixture is not properly treated.

Such concrete will not equal in strength that deduced by theory and will not be equal to its requirements as obtained from calculations. It is therefore a danger to the whole structure.

In many cases faulty concrete is due to ignorance of its preparation and use. It is therefore evident that concrete structures should be executed by skilful and experienced workmen. Also the closest supervision is necessary during the mixing, filling and ramming. The latter is accentuated by the fact that it is not always possible to test many parts of the concrete after it has been fixed in position.

Concrete should be prepared on the site so as to obviate cartage, which is detrimental. This is evident on considering that the specific gravity of the sand is greater than that of the cement, and, as a consequence, through the jarring the cement comes to the top and the sand sinks to the bottom. The proper quantity to be added is defined by chemists as the lowest quantity necessary to bring to setting all the cement in the mixture, as it is just necessary to bring into proximity the particles of cement, sand and other material.

But that the presence of superfluous water cannot prevent concrete from setting is evidenced by the many foundations which have been laid under water.

The ramming should expel all air and water. The mixture should be uniform when finished in position (*i.e.* the crushed stone or brick or whatever is used should be tied together by the same amount of mortar throughout).

The evaporation of water during the working and the absorption by supporting timbers makes it necessary to add more water than the chemical limit.

The well-known rule, ram the concrete until the water appears on the surface, shows that this rule anticipates an excessive quantity of water. There is, however, a limit to the amount of water to be added in mixing the concrete, for beyond a certain point of saturation ramming will be useless. Therefore the water which cannot be driven out of the concrete by ramming evaporates as the concrete sets, consequently leaving the concrete porous, which is most undesirable.

Concretes of two different consistencies are obtained according to the quantity and proportion of water used.

I. Concrete to which only sufficient water has been added to enable its being moulded into a ball by the hand.

II. Concrete to which more water has been added than in the former case and which presents a soft and plastic appearance after ramming.

No rule can be given whereby the quantity of water may be calculated for every possible case, because the degree of moisture in the sand is not always the same.

However, in case I. the percentage may be taken approximately at 4 to 5 per cent. For case II. double the amount will be required at 7 to 10 per cent.

Concrete of the proportion of case II. is to be recommended for reinforced work because it accommodates itself to the iron; it also clings more tenaciously to the iron than concrete moistened as case I.

Thus for armoured concrete soft concrete must be always used; but for ordinary concretework both kinds must be considered. The selection will be determined by the particular case under consideration. It is perhaps well to notice that concrete mixed by machinery is shown by experiments to be superior to that mixed by manual labour.

Want of time prohibits a detailed account of the several building systems. I shall give a brief description of the strength of ferro-concrete.

If a body is acted on by external forces molecular movements result, and consequently each particle of the body is distorted in form. There are in general in concrete three forces, viz. tensile, compressive and shearing forces.

The materials of which reinforced concrete is composed, viz. concrete proper and iron, differ on several points as to their suitability to withstand particular forces. Iron is suited to withstand either a compressive force or a tensile force, or a force which produces a shearing stress. Cement concrete offers a high resistance to crushing, but it is not calculated to resist to any great extent either a shearing or a tensile force. The force required to rupture concrete when acting in tension is equal to one-tenth the force required to crush the same concrete.

Therefore the fundamental rule to keep before the mind is to augment the strength of the concrete by a metallic skeleton in those places where tensile and shearing stresses are to be expected.

It is therefore evident that concrete requires reinforcement only when the tensile and shearing forces produce in the concrete their corresponding stresses in excess of what the concrete can withstand.

Concrete possesses several advantages over both natural and artificial stone, both as regards its more ready adaptability to various shapes and the small cost of making moulds to secure these shapes. In the case of stone it requires the skill of the mason and sculptor to secure favourable results. These are all elements which go to increase the cost of the work. Also it is sometimes impossible to secure competent mechanics. When concrete is used the mould is easily and cheaply made. Also the ratio of skilled to unskilled labour when concrete is used will be much less than the ratio of the same elements in the case of stone or iron.

Further, it must be considered that in consequence of the strong and close interlocking of all parts of a ferro-concrete structure more factors take part in the bearing of the load than generally appears in the calculations and any of the other building systems manifest it.

When examining the iron bridges a slight sagging of the whole structure is noticeable, but this is of very little importance as the sagging is the product of many and infinitely small elastic displacements of the single parts and cross sections; it is thus not necessary that one or more faults in the cross section of a girder, badly rivetted joint, &c., are observed in the sagging, which in most cases is less than the figure obtained by calculation. Therefore a careful examination of the whole structure besides the statical control cannot be dispensed with. The sagging in reinforced concrete structures need not be taken into account, as insufficient dimensions in regard to shearing and adhesion strains do not influence the sagging.

As with all other structures whether built of iron, brick or wood, the engineer should carefully supervise it, also in the case of a reinforced concrete building I regard a technical supervision as imperative. In connection therewith the testing of the building materials to be used comprise the usual iron and cement tests and tests of the strength of the whole concrete cubes have firstly to be proceeded with; secondly, attention has to be paid to the method of working, to the supervision of the composition of mixture of the cement, sand and grit, of the proper treatment of the concrete, the ramming, strong scaffolding and centreing, exact keeping of the dimensions, and generally all such precautions to insure first-class workmanship. Only by these measures can carelessness in the execution of reinforced concrete structures be prevented, which under certain circumstances might lead to serious accidents, thereby discrediting this new building system.

Everyone familiar with this new building system will admit that there exist a great many reinforced concrete constructions which give full satisfaction as to the purposes they are erected for, and still exercise that resistance if the limit of the strain is reached or even exceeded for which the structures are calculated. Considering such splendid qualities as proved with existing structures, it should cause no difficulty to erect structures of other dimensions and with complicated stresses, if the formula which is employed for the calculation of the dimensions of the proved structures was generalised and extended to the new contemplated purpose, and if the new fundamental materials, concrete and iron, were of the same quality and were worked with the same carefulness.

While iron, wood, brick structures, &c., are liable to decay, therefore requiring frequent overhauling, reinforced concrete constructions are gaining in strength in the course of time. Not only do these buildings resist elements, as moisture, temperature, &c., but also the most chemical reactions have no effect on them. The iron embedded in the Portland cement concrete remains perpetually unaltered, and ferro-concrete construction can be considered as practically indestructible by any causes.

Reinforced concrete, undoubtedly, is rapidly coming to the front in other countries, and although the price of cement prevents it being extensively used at the present time in South Africa, yet the day is not far distant when cement will be manufactured within a hundred miles of Johannesburg and placed on the market at half the present price. Then, with cheap material, we may expect to see the combination of metal and concrete introduced into such engineering works as bridges, dams, weirs, &c.

In conclusion, I wish to express the hope of having an opportunity of following this paper up with one in which I desire to only touch questions concerning the mining industry, and prove to you that concrete or reinforced concrete could play an important part in the outlining of shafts, headgears, cyanide tanks, dams, &c.

RESTORATION OF CHURCHES.

A MEETING of the Society for the Protection of Ancient Buildings was held on Wednesday. Unusual interest was added to the proceedings by the reading of a paper by Mr. Thomas Hardy, the novelist, who was, as our readers know, trained as an architect.

In the course of it, Mr. Hardy said that it might be true that our more intelligent architects now knew the better way, and that damage was limited largely to minor buildings and to obscure places. But continue it did, despite the efforts of that Society, nor did it seem ever likely to stop till all tampering with chronicles in stone was forbidden by law, and all operations bearing on their repair permitted only under the eyes of properly qualified inspectors.

The difficulty which they encountered on the threshold in respect of church conservation was the fact that the building was held in two contradictory lights, and was required for two incompatible purposes. To the incumbent the church was a workshop or laboratory; to the antiquary it was a relic. To the parish it was a utility, to the outsider it was a luxury. How could they unite these incompatibles? The author went on to refer to wantonness in bodily pulling down an old church that a more stylish one might be erected, the shifting of old windows and other details irregularly spaced, and to "monumental puss-in-the-corner." *Apropos* of this he said that one would like to know if any note had been kept of the original position of Milton's monument in Cripplegate Church, which, he believed, had been moved more than once, and if the position of his rifled grave was now known. Continuing, Mr. Hardy, after dwelling upon the mistakes of builders and the abuses in the rehanging of bells, asked why the old sets of chimes had been removed from nearly all the country churches. The midnight wayfarer, in passing along the sleeping village or town, was cheered by the outburst of a stumbling tune, which possessed the added charm of being heeded probably by no ear but his own. But one might go half across England and hear no chimes at midnight now.

Another abuse of ecclesiastical fabrics was that arising from the fixing of Christmas decorations. The battalion of young ladies to whom the decking with holly and ivy was usually entrusted seemed to be possessed with the fixed idea that nails might be driven not only into old oak and into the joints of the masonry, but into the freestone itself, if one only hit hard enough. He lately found a fifteenth-century arch to have suffered more damage during the last twenty years from this cause than during the previous 500 of its existence. Restoration was practically objectionable and well-nigh impossible, and, moreover, was fatal to human interest. Some might be of a different opinion; but he thought that the damage done to the sentiment of association by replacement, by the rupture of continuity, was mainly what made the enormous loss the country had sustained from its seventy years of church restoration so tragic and deplorable. The protection of an ancient edifice against renewal in fresh materials was, in fact, even more of a social—he might say humane—duty than an æsthetic one; it was the preservation of memories, history, fellowship, fraternities.

Digitized by Google

By a curious irony, the parts of a church that had suffered the most complete obliteration were those of the closest personal relation. Their duty lay in organising resistance to the enthusiasm for newness of those priests and churchwardens who regarded a church as a sort of villa, to be made convenient and fashionable for the occupiers of the moment.

WALKER ART GALLERY.

THE curator, in his report to the Liverpool Corporation, remarks that as the collection increases in number and importance it becomes more and more difficult to do justice to it, and the need for a large addition to the gallery becomes more pressing. In the rearrangement of the collection some beginnings had been made in the direction of classification; notably the works by Liverpool artists had been brought together with a view to illustrating the scope and style of the local schools. This innovation had met with cordial appreciation on the part of those who take a particular interest in the art history of the city, and already as a result several valuable additions to the collection had been made. It was still far from being adequately representative, and the committee hoped that local collectors may assist in supplying the deficiencies. The additions to the permanent collection during 1905 were not so numerous as in the previous year, but they include several works of great interest and value. In consequence of the much regretted death of Mrs. Rathbone, the pictures bequeathed to the city by the late Alderman Philip H. Rathbone had now been handed over by his executor. Some progress had been made in the important task of investigating the state of the works constituting the permanent collection, with a view to their conservation. A number of frames had been repaired and regilded, many of the pictures had been supplied with descriptive lettering, and for the sculpture, &c., more suitable pedestals had been provided. The negotiations with the trustees of the Royal Institution, in reference to the "Roscoe" collection of works by old masters, had proceeded to an agreement (arrived at early in 1906) to the effect that the Corporation shall apply in its next Omnibus Bill for power to take over the collection from the trustees on such terms, mutually agreed upon, as may justify the Corporation in incurring the expenditure necessary for the conservation and proper display of the pictures. The autumn exhibition was open during ninety-five days and seventy-two evenings from September 18, 1905, to January 6, 1906. The exhibition was widely representative of the best art movements of the day, and was generally allowed to be of more than ordinary interest and attractiveness. The attendance of the public (both as regards single admissions and season tickets) was larger than in 1904, the total being 55,313, and 3,765 season-ticket holders. The number of works shown, according to the catalogue, was 1,989, of which 247 were sold, the catalogue prices of which amounted to 6,173*l*. During the year the total number of persons who passed through the turnstiles to the gallery was 350,769, or a daily average of 1,008. The attendances of students during the year numbered 2,191.

IRON AND STEEL INSTITUTE.

A JOINT meeting of members of the American Institute of Mining Engineers and of the Iron and Steel Institute will be held in London on July 24, 25 and 26. The following papers have been offered for reading:—(1) "Machine Moulding," by P. Bonvillain (Paris); (2) "Tempering and Cutting Tests of High Speed Tool Steels," by Dr. H. C. H. Carpenter (Manchester); (3) "The Nodulising and Desulphurisation of Fine Iron Ores," by A. Ladd Colby (New York); (4) "Belgian Practice in Large Gas Engines," by Professor H. Hubert (Liège); (5) "Electric Steel Smelting," by E. C. Ibbotson (Sheffield); (6) "Different Methods of Blast Furnace Refrigeration and their Power Requirements," by J. E. Johnson, jun. (Longdale, Virginia, U.S.A.); (7) "The Crystallography of Iron," by F. Osmond (Paris); (8) "German Practice in large Gas Engines," by K. Reinhardt (Dortmund); (9) "The Development of the Roe Puddling Process," by James P. Roe (Pottstown, Pa., U.S.A.); (10) "The Constitution of Iron Carbon Alloys," by Albert Sauveur (Cambridge, Mass., U.S.A.); (11) "The Influence of Silicon and Graphite on the Open Hearth Process," by Alex. S. Thomas (Cardiff); (and (12) "British Practice in Large Gas Engines," by Tom Westgarth (Middlesbrough). At the meeting of the American Institute of Mining Engineers several important papers dealing with iron and steel will be submitted, the list including the following:—(1) "Comparison of American and European Rail Specifications," by A. Ladd Colby (New York); (2) "Piping and Segregation in Steel Ingots," by H. M. Howe (New York); (3) "The Effect of Low Temperature on the Recovery of Steel from Overstrain," by E. J. McCaustland (Ithaca); and (4) "Improvements in Rolling Iron and Steel," by James E. York (New York).

ETRUSCAN ART.

IN art the Etruscans were evident imitators of the Greeks, and when it advanced in Greece, and not till then, did it improve in Etruria; sometimes not till after a considerable period, though the Greeks settled in the country who worked for them, and the constant intercourse with Greece gave the Etruscans facilities for becoming acquainted with the progress of their instructors. The vases of the earliest Greek styles were, therefore, the first introduced into Etruria, and the others followed in succession as art advanced in Greece; for the Etruscans had no real art of their own creating, though they had the good taste to appreciate and patronise it. They were skilful workmen and a clever, imitative people; and they even learnt from the Greeks in their employ to reproduce successfully what they admired. They had an early predilection for works in clay, and this led them by degrees to cast various objects in bronze and even statues, but marble figures were rarely attempted by them. But in all branches of art it was evident whence that art was derived; Greek taste always pervaded it, their bas-reliefs, meat utensils and ornaments as well as vases proclaimed to what their excellence was attributable. It is true that in their ornaments some peculiarities appear which differ from anything Greek, and the inscriptions in Etruscan show the mirrors and other bronze works and even statues to be their own; but still though the names of the gods are Etruscan, the mythology is Greek. Certain mannerisms such as the position of the hands of the figures and other peculiarities in the paintings also testify to their being the work of native artists. Whenever there is any real attempt at architecture in the columns or the sculptured fronts the style is Greek. The doorways of the tombs, which are often false and recessed, like those of the tombs about the pyramids of Memphis, are evidently from an Egyptian model, though the Etruscans, misunderstanding the object of the sloping line of Egyptian monuments, have made the inner faces of the jamb itself incline inwards as well as the external edges. This is a mistake committed also by the Greeks. Their round shields, their helmets, greaves and other arms offensive and defensive are also Greek, as are their lyres and arrows, musical instruments, their amusements indoors and out of the house, their feasts and their chariot races, their jewellery and other works of taste.

CORRESPONDENCE.

Association Evening School.

SIR,—May I call your attention to the statement made under "Notes and Comments" in your issue of June 15? It is there stated that the evening studio of the Association is being closed. This is by no means the case. The Council has for some time past had under consideration the advisability of amalgamating the evening studio (formerly conducted by Mr. W. G. B. Lewis) with the evening continuation school. With the two schools under separate heads there was much overlapping, and from a financial as well as an educational point of view the new scheme will be advantageous to all students, as provision will be made not only for students who have passed through the day school, but for those students who are engaged in offices during the daytime, as well as for those who wish to prepare for the R.I.B.A. examinations, or are desirous of taking up separate subjects in design or construction. The new arrangement will provide evening instruction which will supply the wants of all grades of students without disturbing the smooth working of the scheme of continuous study, and it was evident to the Council that the time had arrived when the studio system should be codified into one scheme.—Yours faithfully,

H. TANNER, JUN., Hon. Secretary.

June 20, 1906.

GENERAL.

Mr. H. A. Grueber, F.S.A., has been appointed to be Keeper of the Department of Coins and Medals in the British Museum, in the room of Mr. B. V. Head, who is retiring from the position at the end of the month under the age-limit rule. Mr. Grueber has served in the Department for over forty years, and since 1893 has been the assistant keeper. He is honorary secretary of the Numismatic Society.

Mr. W. D. Church, senior partner of Messrs. Church & Son, architects, of South Place, Finsbury, died recently at Stoke Newington. Mr. Church was well known in Non-conformist circles, and was the architect of several churches in London, and from his designs the extension of the Memorial Hall Buildings in Farringdon Street were erected.

The Edinburgh and District Water Trustees have remitted "to the works committee to consider the terms and conditions of the engineer's appointment, and especially whether a fixed salary should now be paid for the engineer's services, to include all payments by way of commissions on contract work, or for extra advice, or assistance, or otherwise, and to report."

The Peterborough Cathedral restoration committee are about to undertake the repair of the north transept on the advice of their architect, Mr. G. F. Bodley, R.A. The north wall leans a good deal, but Mr. Bodley thinks the settlement took place a considerable time ago and that the masonry has now got its bearing. The cracks and displacements require to be carefully treated. Mr. Bodley says:—"The building must obviously be accepted as an ancient one, and all the old work that it is possible to retain should be retained. But all that adds to the durability of the fabric and to its greater preservation should be certainly carried out as soon as is possible, and any glaring deficiency should be made good."

The Parks and Galleries Committee of the Glasgow Corporation have by a majority declined a request by the Corporation of Toronto for the loan of the Whistler "Carlyle" for exhibition at the Canadian National Exhibition, which is to be held at Toronto at the end of August.

The Aberdeen Town Council have agreed to a scheme for the widening of Union Bridge at a cost of 9,500*l.*

All Persons applying for leave to use the camera in the British Museum are now charged 2*s.* for one negative, while for more than one the fee, to put it in the official phraseology, is a time fee, viz. 2*s.* for the first hour or part thereof, and 1*s.* for each succeeding hour or part thereof in the day.

The United States House of Representatives have decided on the adoption of the lock type for the Panama Canal. The Civil Appropriation Bill appropriates 5,000,000*l.* for the purpose of continuing work on the canal.

The Commons and Footpaths' Preservation Society have during the last two years dealt with 1,217 cases, 324 of which affected commons and open spaces, 816 rights of way, and 77 were in regard to Bills before Parliament dealing with commons and open spaces in which they came to an agreement with the promoters. Of the total number of cases nineteen came before the Law Courts, but only eight resulted in favour of the public and eleven against.

Professor Legros is to be entertained at dinner by former pupils of the Slade School at Princes Restaurant on July 9. Mr. William Strang, A.R.A., is the chairman, and Mr. Harrington Mann is the secretary.

A Meeting of the Council of the Queen Victoria Memorial school for the sons of Scottish soldiers and sailors was held at Edinburgh on Monday. It was reported that 44,117*l.* had been subscribed, and that after conferences with the War Office plans had been adopted and tenders received, so that the necessary steps for proceeding with the erection of the building at Dunblane would now be taken.

The Memorial to commemorate the services rendered to archæology by Dr. A. J. Evans is to take the form of his portrait, painted by Sir W. B. Richmond, R.A., and deposited in the Ashmolean Museum, of which Dr. Evans has been keeper for nearly a quarter of a century. A general committee has been formed, of which Dr. G. A. Macmillan is hon. treasurer and Mr. D. G. Hogarth and Mr. C. F. Bell are the hon. secretaries.

A Society of the Friends of Art in Manchester is to be formed on the same lines as the National Art Collections Fund of London and the Société des Amis du Louvre of Paris.

The Senekal Town Council, South Africa, seek an official for the combined posts of town engineer, sanitary inspector, market assistant and general municipal handy man. The duties include attending to all repairs of whatever sort, to superintend the laying of water-pipes, fix up new taps and do all the municipal engineering work. The salary offered is 12*l.* 10*s.* per month.

The Royal Dublin Fusiliers' memorial fund committee hope to be in a position next week to order the commencement of the work. The memorial will take the form of an arch, which it has been decided shall be modelled upon that of the Arch of Titus. It will consist of Irish material and workmanship, and will be entrusted to Irish contractors. Sir Thomas Drew, R.H.A., has prepared the plans.

The Glasgow Architectural Association held their annual business meeting last week. The membership has increased by twenty-three during the session, and four gentlemen were nominated for election. Office-bearers for the ensuing session were appointed, with the following results:—Mr. Lochhead was re-elected president. As vice-presidents, Mr. James M'Kissack and Mr. Alex. Wingate were re-elected. The honorary secretaries, Mr. Stephen Adam, jun., and Mr. Alan G. M'Naughtan were again appointed. Mr. E. D. Smith was re-elected honorary librarian, and the new Council consists of Messrs. Whitelaw, Blain, Davie, Dewar, Malcolm, Baxter and Wyllie.

The Council of the Society of Arts have awarded the Society's silver medal to the following readers of papers during the session just completed:—Mr. W. F. Mitchell, Dr. William Arthur Aikin, Mr. Leon Gaster, Mr. Walter Garstang, Captain G. S. C. Swinton, Mr. Bernard B. Redwood, Mr. J. B. Millett, Professor Thomas Oliver, Mr. Clayton Beadle, Sir James A. Bourdillon, Dr. George A. Grierson, Colonel Sir Arthur Henry McMahon, the Hon. Rodolphe Lemieux, K.C., the Hon. J. G. Jenkins, Mr. Louis N. Parker, Mr. H. Yates Thompson and Mr. Harry Powell.

A Second Competition, it is understood, will be arranged for the Palace of Peace at The Hague, and which, it is to be hoped, will have a more satisfactory result than the first.

The Competition for the new infirmary at Edmonton is to be restricted to five architects. Mr. Rowland Plumbe will be the assessor. The buildings, when completed, are expected to cost 250,000*l.*

A Drawing by Albert Dürer, which hitherto was unrecognised, has been discovered in one of the collections of the Louvre. The subject is *Christ before Pilate.* It is supposed to have been executed about 1504.

Mr. McKenna, M.P., replying on Tuesday to a question in the House of Commons, stated the sum necessary for the preservation of ancient monuments is voted by Parliament and varies according to the estimated requirements of the year. For 1906-7 the sum inserted in the Estimate for Public Works, &c., Ireland, is 351*l.* The sum applicable to national monuments consists of the income derived from dividends on Consolidated stock held by the Board of Works. For each of the two years to March 31, 1906, the amount of this income was 873*l.* 9*s.* 4*d.* In 1904-5 the expenditure on ancient monuments was 516*l.* 6*s.* 2*d.*, and on national monuments 870*l.* 12*s.*

The Six Communion Cups recently disposed of by the Yarmouth Congregational church, then entered for sale in London and withdrawn, are to return to Yarmouth. From legal documents dated 1733, discovered in the office of a Yarmouth solicitor, it appears that these historical examples of Puritan plate, dating from 1654, are held by trustees as part of the property of the church. The deacons on being apprised of the existence of this deed on Monday decided to repurchase the cups, which had been parted with for about 2,000*l.*

The International Society of Sculptors, Painters and Gravers have decided to devote the next exhibition at the New Gallery, during January, February and March 1907, entirely to the works of members.

The Board of Education of Cincinnati, Ohio, intend to construct a high school building at a cost not exceeding 500,000 dols. The architect will be chosen by competition. First prize will be employment as architect of the building at a compensation of 2 per cent. The Board of Education will furnish its own superintendent. Second, third and fourth prizes will be paid in cash in the sums of 750 dols. 650 dols. and 500 dols.

The Architect.

THE WEEK.

THE report of the select committee on the Housing of the Working Classes Act is likely to be a strange commentary on what the poet has said about "The cottage homes of England! by thousands on her plains, they're smiling o'er the silv'ry brooks and round the hamlet fanes." Mr. RIDER HAGGARD informed the committee on Monday that he knew a village in Somersetshire in which there was not one house fit for a human being to occupy. The medical officer told him there was no use in condemning them, for the only effect would be to render the people homeless. Near Waltham, in Essex, he found that the home for twenty farm labourers was a brick shed about 14 feet square with no windows. On Sundays the men cooked their dinners in the open air. The worst cottages were found to belong to speculators; and, indeed, people of that class know there is higher interest to be got out of wretched cottages than out of those of a better class. They can be purchased more cheaply and repairs may be neglected. It will be difficult for the committee to discover a remedy. Mr. RIDER HAGGARD said he would not mind leaving the matter in the hands of the District Council. But that would mean that repairs and rebuilding would fall on those who do not employ the labourers, whilst those who have their aid would not have to contribute at a higher rate than ordinary people.

THE subject of the Greenwich generating station, and the possibility of its disturbing the apparatus in the Royal Observatory, came up for consideration before the County Council on Tuesday. As usual, there has been much exaggeration about the risks. Up to the present it appears there has been no serious interference with the work at the Observatory. It is also believed that the possibility of danger could be removed. Meanwhile the highways committee have suspended the erection of the new chimneys, and an assurance was given to the Admiralty that the Council would co-operate with the authorities in ascertaining the best means to obviate interference with the work of the Observatory. The outcry has been against the County Council, but the authorities of the Observatory are to blame. The usual procedure which has to be followed when such works as a generating station are contemplated was not neglected. There were advertisements in the papers about the proposal, plans were lodged, and there was the customary inquiry before a Parliamentary committee. There are no Bills which receive closer scrutiny than the London County Council's. But neither the officers of the Observatory nor the Admiralty took precautions against the danger which, if it was a real one, could easily have been foreseen. Then, when the buildings were erected and the machinery in place, the guardians of the Observatory became alarmed. It is not the first time that Government officials have made discoveries about an impending danger which might have been avoided if ordinary care had been taken.

IT is generally believed that $2\frac{1}{2}$ per cent. can be charged by an architect on works originally included in the contract or tender, but which were not carried out. A case in which the principle was involved has been tried in the Norwich County Court. Mr. BLYTH, an architect of Lowestoft, sought to recover 41*l.* 17*s.* 10*d.* in respect of plans for alterations of an hotel. His claim was based on a charge of 5 per cent. on the total amount paid and $2\frac{1}{2}$ per cent. on amounts struck out. The tender originally amounted to 682*l.* 11*s.*, but with extras the contract price was eventually 1,216*l.* 12*s.* 11*d.* After plaintiff's evidence he was about to be cross-examined as to the $2\frac{1}{2}$ per cent. charged on omissions. The Judge said he would not allow such a charge when there was a large increase. The defence was that the plaintiff's superintendence was unnecessary. But the Judge held that as the plaintiff would be responsible for any error, he was therefore bound to superintend the work. Finally, judgment was given for the plaintiff for 39*l.* 16*s.* 7*d.*, though no percentage was allowed on the omissions. As far as we can make out, there was nothing peculiar in the case. Two architects who were witnesses said the charges were fair, and the statement that plaintiff was willing to carry out the work at $2\frac{1}{2}$ per cent. was not confirmed. In such a case an agreement in writing would have obviated litigation; yet in a country town where all the parties are known to each other the expression of doubt may be misinterpreted, and the suggestion of an agreement would lead to the calling in of another architect.

THE French Académie des Inscriptions et Belles-Lettres have been lately successful in deciphering and completing an inscription on a stone which was found in the course of the excavations for the Métropolitain at the Quai aux Fleurs. It belonged to the wall existing when Paris was a Roman settlement. The Academy was not always equally successful. The prized inscription "A.D.L.L.," which MONKBARNS, the antiquary, interpreted as signifying *Agricola Dicavit Libens Lubens*, but which really stood for "Aiken Drum's Lang Ladle," and the no less wonderful discovery of Mr. PICKWICK at Cobham, appear to have had their origin in an old effort of the Academy. A stone was found bearing the following words, forming five lines:—

Icil Eche Mind Esan Es.

There were various interpretations, and all different. Fortunately a beadle came to the aid of the archæologists. He remembered when the stone was in its place, and the words when properly arranged formed a direction, *Ici le chemin des ânes.* In fact, it was intended to guide the builders' labourers who used to go to the quarries at Montmartre for lime or plaster, and who had to descend by rather precipitous and confused routes.

IT would be difficult to discover a country so favourable to the growth of officialdom as Ireland. Occasionally from the excess—for under the new regulations there is no weeding or pruning—there is a tendency to dispute the territory, which is not always advantageous to the people. That seems to be the condition of affairs at the present time with regard to schools. The Resident Commissioner of National Education has been giving evidence before one of the commissions which have succeeded each other time out of mind, and he says that they are not able to build a school in Ireland. Those which exist are a scandal to the Government, for they are allowed to be in an abominable state of filth and degradation. This is easily understood when it is found that a consultative committee which is supposed to possess great powers has only met five times in six years. On the other hand, they are able to give orders in five minutes which take six years to carry out. There is a National Board of Education, an Intermediary Board, a Technical Board, an Agricultural and Technical Department, and they all seem to be at loggerheads. Examinations cost 2*l.* a head, which is probably more than the cost of education for a year, and to prevent cribbing 10*s.* a year per head has to be paid. Each department has its own rules and regulations, which are as unalterable as those of the Medes and the Persians, and to get anything done it is necessary to run the gauntlet of them all. The Resident Commissioner thinks there ought to be only a single authority. But there would be such an outcry by the numerous existing authorities, there is no likelihood of such a desirable end being attained.

SIR LAWRENCE ALMA-TADEMA, R.A.

THE Royal Gold Medal for the promotion of architecture was on Monday conferred upon Sir LAWRENCE ALMA-TADEMA. It was the second occasion when a painter was the recipient, and by a remarkable coincidence both were painters of ancient Greek and Roman life. Both might also be considered as mural painters in the modern sense of the phrase. Lord LEIGHTON painted directly on the walls of a church in the Isle of Wight and in the museum at South Kensington. He also was prepared to take a part in the decoration of St. Paul's. Sir L. ALMA-TADEMA assisted in the mural works at the Antwerp town hall. But that was nearly fifty years ago. The prices paid for his works in England, and which did not exceed their value, were at a rate that would make mural works on a large scale almost beyond the resources of millionaires. It is, therefore, as a painter of easel pictures and as a creator of cabinet paintings, rather than as a decorator, that the artist must be considered. In one sense his nomination would seem to open the door to a great many candidates. For, indeed, it would now be difficult to decide what painter was not eligible for the distinction.

If, however, we remember that one of the conditions for a gold medallist is the production of "a work tending to promote or facilitate the knowledge of architecture," then there is hardly another artist among English painters who is on an equality with him. He has certainly never attempted to recreate an entire building and to make it the subject of one of his pictures. His *Phidias at the Parthenon* was suggestive of a great temple in process of construction, and parts of buildings have been introduced with remarkable skill in the majority of his paintings. But Sir L. ALMA-TADEMA was always more than a painter of costumes, of buildings or of ancient objects. M. CHESNEAU described the artist's work as an accurate illustration of SMITH'S "Dictionary of Antiquities." That book is a credit to English scholarship and to GEORGE SCHARFF and other draughtsmen. But it is almost as widely differentiated from Sir ALMA-TADEMA'S work as from Greek and Roman life. The woodcuts are diagrams, and a great many of the defects of English classical and historical paintings have been owing to the belief that such things could be without difficulty translated into pictures. Anyone who will read the suggestions given by Sir WALTER SCOTT to a painter who had selected "Chevy Chase" for a subject will find that much more than any dictionary of antiquities is desirable for the creation of an historic scene. SCOTT realised that the typical examples which have to be adopted in treatises on armour, costume or other branch of archæology were not likely to prevail at any time. It would be as absurd to suppose that all ladies at the present day walked about the streets in the dresses shown in the fashion plates as to assume that the scenes in Athens or Rome, or in Greek or Roman houses, corresponded with what is found in dictionaries of antiquities. Costume always acquired a character corresponding with individualities. SCOTT pointed out the ancient description of a marauder who had trews of buckskin "wi' a' the hair aboon." But he took care to warn the artist that such a costume, although warranted by evidence, should only be used for one wild figure in the picture of "Chevy Chase."

SCOTT had the power of self-projection, and was able to live, as it were, in any period or country, or among any race he had made the object of his studies. Purists in archæology have declared that his descriptions are misleading. But in compensation we have beings in whose existence we are compelled to believe. The French hold that CORNEILLE'S Romans are far superior to SHAKESPEARE'S. But, as Dr. JOHNSON has said truly, the English dramatist's Romans are men—which is more than can be said of the Frenchman's. Sir L. ALMA-TADEMA has, no doubt, studied SMITH'S "Dictionary." But he has studied much else besides; and he possesses the skill to impart to inanimate objects an importance far beyond that given to them by the keepers of museums or the vast majority of visitors to collections. Sir LAWRENCE is a Dutchman. But in his ways he is a thorough Englishman. He has the faculty of being easily acclimatised, and if he cared he could present a convincing picture of an English scene of, say, the eighteenth century. He could also paint an incident of our time with as much ease and accuracy as he paints the portrait of a living Englishman or English lady. That power is shown in his incidents from ancient history. Costumes, marbles and decorative objects will all repay examination as he depicts them. But what strikes the ordinary spectator is the conviction that the picture as a whole is a close approach to a representation of what at one time must have happened. RUSKIN was, therefore, unwarranted so far as the experience of ordinary people could go, when he said:—"M. TADEMA, after reading his SMITH'S 'Dictionary' through from A to Z, knows nothing of Rome but her shadow, and that cast at sunset." If the study of all the remains of antiquity is not sufficient to enable a clever artist to depict an ancient scene, then the sooner men forget there was a past the better for themselves. All such efforts are, if Mr. RUSKIN'S theory is accepted, only waste of time, and artists had better occupy themselves with painting daisies and coloured stones.

Painting undoubtedly can assist the historian, and it is possible that artists may yet exist who will be able to surpass the Roman scenes of Sir L. ALMA-TADEMA, as he has surpassed those of DAVID and BENJAMIN WEST. But it is doubtful whether any of the future painters will be more devoted to a particular period. There are many admirers of Sir L. ALMA-TADEMA who express regret that he should have abandoned Merovingian scenes for those of Greece and Rome. The recitals of AUGUSTIN THIERRY continue to be attractive, and we seem, as it were, when reading them, to see the beginning of that social formation in which we live. The remnants of barbarism which still existed in those days are at least picturesque, and Sir LAWRENCE found no difficulty in making many pleasant pictures out of them. But he may be said to have forsaken such subjects when he arrived in England. Perhaps he supposed that the early history of the Franks would have little attraction for Anglo-Saxons.

Since 1869 England has had the benefit of seeing every year one or more masterpieces which bring back Greek or Roman life before the eyes of visitors to the Academy or Grafton Gallery. That the standard of excellence could be maintained for nearly forty years is remarkable. In producing such works a painter must have all his thoughts at a very high level. Classic subjects, whether taken from the Forum or the kitchen, are supposed to have something of the ideal about them, and it would be fatal to suggest, like JOHN LEECH in his illustrations to Roman history, that there was often a correspondence between antiquity and our time. GÉRÔME, who likewise could paint admirable Greek and Roman scenes, took care to diversify them with those of a later period. RICHELIEU and NAPOLEON made it more easy for him to paint CÆSAR or gladiators. Sir L. ALMA-TADEMA has been strong enough to bear the strain with only the occasional variation of a portrait of some friend.

In his paintings he has realised the importance of architecture to the Roman grandees at least. We are ignorant about the domestic architecture of Greece; and Pompeii suggests how Romans, in order to escape from the life of the city, put up with as much inconvenience as Englishmen now endure in their so-called holidays. But we must believe that the men who, amidst the pride, pomp and circumstance of glorious war, set a high value on statues were able to realise that a marble or bronze figure lost much of its importance if it had a mean background. We cannot suppose that AGRIPPA gave audience to clients amidst such simple surroundings as

Digitized by Google

suited CINCINNATUS or CAMILLUS. The architecture which Sir L. ALMA-TADEMA employed must have secured favour for English attempts to revive similar forms in buildings.

Simple humourists parade their cleverness by remarks on the marble which is so effectively introduced into the majority of his paintings. They do not realise that no other material is so well adapted for a background, apart altogether from the necessity of using marble as evidence of Roman luxury. Supposing the marble seats with their great curves were supplanted by tapestry, would the figures gain in importance? It might even be concluded that for the display of Greek and Roman costumes, and the delicate contrast which is a necessity, no more suitable material could be found than marble. In one of his tragic pictures, where the murder of one emperor is immediately followed by the discovery of another, massive drapery has to be introduced, and in quantity and colour it exceeds the marble. There is no doubt it adds to the effect of such a scene. But if compared with one of the idylls or compositions in which young girls and children are introduced, we recognise at once how well the artist understands the relative merits of different materials in order to add importance to his living figures.

In his reply on Monday Sir L. ALMA-TADEMA spoke modestly about his own acquaintance with architecture. His own studio would by itself be enough to suggest that he does not seek models by confining himself to SMITH'S "Dictionary of Antiquities." What is true of building with him is no less applicable to much else which appears in his paintings. Sir L. ALMA-TADEMA is not only a painter of a very high class, but he is an archæologist for whom the dry bones of the science are animated, and if not an architect he is an enthusiast for architecture of the noblest class.

AN ACADEMY RECORD.*

IT has been a misfortune for English art that the Royal Academy has never succeeded in creating or attracting loyalty to itself as an institution. When an exhibition was opened a few years before its establishment Dr. JOHNSON wrote a preface to the catalogue in which he said, "The purpose of this exhibition is not to enrich the artist, but to advance the art; the eminent are not flattered with preference, nor the obscure insulted with contempt; whoever hopes to deserve public favour is here invited to display his merit." These words, although somewhat obscured by rhetoric, indicate that exhibitions were intended for the benefit of artists in general as well as for the public good. But in the Royal Academy a different spirit prevailed from the first. The patronage of the king was secured; and it was announced that royal munificence would be displayed as if the Academy were a national institution. But it was soon manifested that what was sought was the benefit of the members. REYNOLDS, who stood in no need of any outside support, and who was a very honest man, hesitated for a long time before he agreed to be connected with the project. One of the results has been that outsiders have imitated the selfishness of the members, and endeavour as far as possible to utilise the Academy for their individual advantage. Anyone moving among exhibitors at the Academy must be aware that Mr. ALGERNON GRAVES'S "Dictionary of Contributors," which is the history of English art since 1769, does not excite the interest which so important a record deserves. Artists have not been taught by what they have heard of Academicians during that period to entertain much respect for them. They know of members whose works are now valued at less sums than were paid for the canvas or the marble. The demand has been for single volumes in which an artist's own contributions are registered, and the publishers have been compelled to accept the conditions of the market. Any volume of the series can now be purchased, and we suppose complete sets will not be found even among the books of Academicians.

The latest volume, which is the sixth of the series, has especial interest. As long as the Academy lasts it will always be associated with the name of Sir JOSHUA REYNOLDS. He is considered to have been the founder, but he was above the littleness of the wirepullers who to a large extent made him a dupe. And the defects from which the Academy has been unable to clear itself after nearly one hundred and forty years' existence should not be ascribed to him. In 1769, when the first exhibition was held, REYNOLDS was in his forty-sixth year. He was not only possessed of great power, but his ability had been recognised. The portraits he was able to show were of a character which would rebuke any efforts to introduce "the loaf and cheese that could provoke hunger, the cat and canary bird, and the dead mackerel on a deal board." Between 1769 and 1790 he never missed a year, and his annual average could be taken at twelve. Considering the quality of the work the number was high. Indeed, he seemed sometimes to have dispossessed another painter, for his portrait of Mrs. PARKER, in the exhibition of 1773, took the place of a portrait by LIOTARD. REYNOLDS believed his success was due to his endeavour to always do his best. Great or vulgar, good subjects or bad, all had nature, and the endeavour to represent them brought improvement. He was constantly experimenting, and if he said he had no settled system with respect to colouring, his unsteadiness proceeded from an inordinate desire to possess every kind of excellence that he saw in the works of other artists; and he admitted that he failed to consider that in colouring, as in style, there are excellences which are incompatible with each other. His own portrait was among those in the exhibition of 1790.

JAMES PAINE, who was clerk of works at Greenwich Hospital and architect to the king, was likely to be well known to REYNOLDS. For when the creation of the Royal Academy was first mooted he prepared plans for a building. It was not then believed that they would be obliged at first to hold their exhibitions in the auction-room opposite Market Lane, in Pall Mall. Although in 1771 apartments in Old Somerset House were assigned to the Academy, they were ill adapted for exhibitions. It was not until 1780 that the first exhibition was held in Somerset House. PAINE'S contributions to the Academy were only seen in 1783, and consisted of elevations of three stone bridges across the Thames at Chertsey, Walton and Kew. His son exhibited a design for a monument to the Earl of CHATHAM in 1781, a court in a prison, and a bridge across the Foyle at Londonderry.

Another early architect was WILLEY REVELEY, who was a pupil of Sir WILLIAM CHAMBERS, and began exhibiting in 1781 with the customary "Mausoleum." He prepared a design for a temple "to the memory of the late Mr. HANDEL" in 1784. He accompanied JAMES STUART in Greece, and sent a drawing showing "Ruins of the Temple of Jupiter Olympus at Athens, with the Acropolis, and taken on the spot," in 1785. His best known work is the church of All Saints at Southampton. The REPTONS are connected with the history of gardening. HUMPHREY, who is described as an honorary exhibitor, sent a drawing of the pump-room at Bath with another drawing in 1787. He proposed various improvements for Bath and for Magdalen College, Oxford. His son, JOHN ADEY REPTON, also appears to have been employed for the improvement of Magdalen. He ceased to exhibit in 1804, but he was among the competitors for the Houses of Parliament and lived until 1860.

* *The Royal Academy of Arts.* A Complete Dictionary of Contributors and their work from its foundation in 1769 to 1904. By Algernon Graves, F.S.A. Vol. VI. Oakes to Rymsdyk. London: Henry Graves & Co., Ltd. George Bell & Sons.)

The doctrine of heredity finds several illustrations in the Dictionary, and among them the PAPWORTH family. JOHN PAPWORTH began exhibiting in 1791 with a "Model of a British Capital, designed by WILLIAM PORDEN," who was an architect connected with JAMES WYATT, and who seems to have had the Prince of WALES, Earl GROSVENOR and other notabilities for clients. One of PORDEN's drawings was "The Elevation of a House lately built for Mrs. FITZHERBERT at Brighton." JOHN PAPWORTH was a regular exhibitor in the latter years of the eighteenth century and the beginning of the nineteenth until 1815. One of his drawings represented the "Hall of Hela, the region of eternal punishment." JOHN BUONAROTTI PAPWORTH was appointed architect to the King of WÜRTEMBERG in 1819, and his last exhibit was a mansion in the Japanese style. C. PAPWORTH was among the honorary exhibitors. GEORGE PAPWORTH began exhibiting in 1796: he was afterwards employed in Dublin, and appears to have been connected also with the manufacture of patent stone. EDGAR GEORGE PAPWORTH was a sculptor, and exhibited a large number of works between 1832 and 1866. EDGAR GEORGE, jun., was also a sculptor who contributed between 1852 and 1882. JOHN WOODY PAPWORTH, architect, began exhibiting in 1837. Then there was R. PAPWORTH, another architect; T. PAPWORTH, a sculptor, and WYATT PAPWORTH, who contributed several designs, but was afterwards known as a constant writer on architectural subjects.

HENRY PARKE was a pupil of Sir JOHN SOANE, and in 1826 he commenced his representations of Egyptian scenery. He drew so many ruins, we can understand why one of his last drawings should be "The Wreck of Ancient and Modern Splendour." Sir JOSEPH PAXTON exhibited in 1854 "The Entrance Court, Mentmore," and two views of the Crystal Palace at Sydenham. The next year he had two views of mansion at Ferrières. The late JOHN LOUGHBOROUGH PEARSON, R.A., first exhibited in 1851, and continued until 1897. Among the designs were several which are masterpieces, such as Holy Trinity, Westminster; St. Peter's, Vauxhall; St. John the Evangelist, Red Lion Square; Truro Cathedral; St. Stephen's, Bournemouth. Sir JAMES PENNETHORNE only exhibited four times between 1823 and 1840. The subjects were the Quadrant, Regent Street; a National Monument, Westminster Hospital, and the Royal Exchange. FRANCIS CRANMER PENROSE exhibited a drawing of a church in 1838. In 1846 he had "A View of the Acropolis at Athens, as it probably appeared at the time of the Crusaders." There were views and suggestions for the completion of St. Paul's, but he was not fortunate in obtaining commissions.

The Royal Academy, it must be allowed, did not set itself against architecture in which iron was the principal element. A drawing by OWEN JONES of a shop front in cast-iron was received. In 1852 Mr. W. V. PICKETT contributed a mansion which was a combination of parts in his system of iron manufacture. An iron verandah, portico, &c., appeared next year, and in 1864 still further designs. It might be supposed that at one time it was considered lucky for an architect to begin with memorials of the dead. W. F. POCOCK enjoyed a large practice for several years, and in 1799, 1800, 1802 and 1803 he was represented by mausolea. His final work in 1841 was the Wesleyan Centenary Hall. AMBROSE POYNTER exhibited a design for a church in 1817; in 1823 he showed the restoration of a house in Pompeii from drawings made on the spot. In 1852 he contributed a hall at Pynes, Devon.

His son, Sir E. J. POYNTER, has been an assiduous exhibitor. From 1861 until the present time, with the exception of the year 1887, one or more of his works added to the interest of the Academy. In 1867 his *Israel in Egypt* appeared, and the next year he was elected an Associate. *Atalanta's Race* was shown in 1876, and in the same year he became an Academician. In 1896 he was elected President and knighted. All who love sterling art must express the hope that pictures by Sir EDWARD POYNTER will be seen in many future years. SAMUEL PROUT exhibited several drawings between 1803 and 1827. The majority of them were English subjects. AUGUSTUS PUGIN, who is described as architect and painter, commenced his career with a design for an intended villa in the North of England. His last works were shown in 1826-7, and related to cemetery buildings. A. W. N. PUGIN did not contribute until 1849, when he was established in practice. His four drawings in that year were "Dining Hall at Alton Towers," "St. George's Cathedral," his house at Ramsgate and "Bilton Grange."

WILLIAM RAILTON is best remembered by the Nelson Column in Trafalgar Square, but between 1829 and 1851 his name was attached to several drawings of paintings and residences. Among the drawings by JAMES RANDALL there was one in 1814 for "A Gallery, as it was intended to have been erected in the Garden of Leicester Square, by B. WEST, P.R.A." If the work had been carried out it would have saved London from an humiliation which was allowed to exist for too long a time. It seems incredible that the late Sir ROBERT RAWLINSON could produce anything which would be accepted at the Royal Academy. He was, however, allowed to present a design for Westminster Bridge, having triumphal arches surmounted by British lions, &c., &c., a design for weaving sheds, and for a water tower. The committee must have been very generous in those days. ROBERT REED had a large practice in Edinburgh. In 1819 he exhibited a "Design for a National Monumental Church for Scotland in the Style of the Parthenon at Athens." It was to be set up at "the north end of the earthen mounds fronting Princes Street, opposite the opening of Hanover Street, Edinburgh." DAVID ROBERTS was so faithful to architecture he deserves to be noticed. France, Spain, Egypt, Palestine, Belgium, Italy, Edinburgh yielded him subjects. But long as is the list of his works, there does not appear to be any example of Greek architecture amongst them.

Recent schemes for metropolitan improvements do not recognise Drury Lane and Covent Garden theatres as centres which deserve to be isolated. In 1812 a drawing was sent by D. ROBERTSON in which he proposed to clear away all the buildings in front of Drury Lane northward to Long Acre, and the whole of the buildings between Drury Lane and Covent Garden theatres, and to make a square two sides of which would be occupied by those theatres, the third by a new theatre and the fourth by new and extensive police offices. The name of PETER F. ROBINSON is now almost unknown, but it was familiar to visitors at the Academy between 1797 and 1833. In 1811 he showed "Museum in Piccadilly for Mr. BULLOCK as an Exhibition for Subjects of Natural History." That was the Egyptian Hall, which was only lately removed; and there the exhibition was held of TOM THUMB, which led to the suicide of BENJAMIN HAYDON in an adjoining room. Mr. GRAVES's "Dictionary of Contributors" will be found to suggest many things which are sad as well as pleasant in the history of English art, and it is deserving of adoption as a national work.

Sir H. Campbell-Bannerman gave a written answer last week to the question whether the Government or the Trustees of the National Gallery, or both of these bodies, have the power to refuse to hang pictures which may be offered them for that purpose by the trustees of the Chantrey Bequest Fund if they consider such pictures unsuitable for permanent exhibition, and whether they have power to return to the trustees such pictures as they may consider it to be unadvisable to retain. Sir H. Campbell-Bannerman says:—The Treasury letter of November 11, 1898, to the Royal Academy gave the trustees of the National Gallery no power to reject Chantrey pictures, and by a letter of November 29, 1898, the trustees concurred in the Treasury arrangement.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. John Belcher, A.R.A., president, in the chair.

Mr. ALEXANDER GRAHAM, hon. secretary, announced the decease of Mr. Andrew Moseley, aged ninety-four, who was elected Associate in 1838, Fellow in 1850, and who was placed on the list of retired Fellows in 1902; and Mr. P. Wilkinson, elected a Fellow 1890.

The Royal Gold Medal, 1906.

The PRESIDENT said:—I count myself peculiarly fortunate in that it falls to my lot to-night to present the Royal Gold Medal to so great an artist as Sir Lawrence Alma-Tadema. You know how sincerely I have desired, how earnestly I have striven, to effect a close relation between the arts, to bring the painter and the sculptor into association and collaboration with the architect for the achievement of the noblest results—results which shall be a triumph of art in its unity and entirety. It is a very happy occasion for me therefore when I am called on behalf of this Institute to do honour to a man like Sir Lawrence, who is not only one of the first of living painters, but has also shown so fine an appreciation and so great a knowledge of architecture, both on its artistic and its practical side, that it has been said that if choice or destiny had not determined him an eminent painter, he might have been a still more eminent architect.

The Gold Medal presented by the King is, as you are aware, conferred annually upon one who is recommended by this Institute and approved of by His Majesty as having designed or executed a building of high merit, or as having produced a work tending to promote or facilitate the knowledge of architecture. Our distinguished member, Sir Lawrence Alma-Tadema, is qualified on both grounds. Indeed, he has rendered such good service to our art—indirectly for the most part it is true, yet not the less substantially and really—that, though he is known to the world chiefly as a great painter, the Institute has felt no hesitation whatever in presenting his name to the King for the Royal Gold Medal, and His Majesty has, with equal readiness we believe, recognised Sir Lawrence's merit and graciously approved the Institute's choice. We have all admired the fine architecture which is so beautiful a feature in many of Sir Lawrence's pictures. Before we speak of that, however, let me tell you, what probably some may not know, that Sir Lawrence *is* an architect. If you have had the privilege of examining the house and studio which he has built himself in St. John's Wood, you will have recognised the hand of a master in every part of it. Not only is it an interesting and delightful building for the ordinary visitor, full of beautiful features which meet you and surprise you at every turn, but it possesses also many details which are worthy of the architect's careful study. The smallest and most insignificant details, in fact, such as would probably escape the layman's attention altogether, have received an amount of thought and care which is both unusual and suggestive. I learnt much that has been useful in Sir Lawrence's house, and its many novel and effective features impressed me greatly. If you ask me what "style" it is—rather an incautious and self-betraying question—I reply, "It is real Alma-Tadema," and that means, at any rate, that it is instinct with life. "To copy and imitate is death to art" is one of Sir Lawrence's principles, and though his archæological knowledge and skill are beyond dispute, and in respect of certain periods and countries unrivalled, yet in his own house he has known well how to be original—both in the arrangement of the plan and in the adaptation of forms and materials to his particular purpose. All is fresh and beautiful, and parts of the house possess a character and environment which would make a Roman of the times of the Empire feel quite at home—even in St. John's Wood. I say a Roman advisedly, of course, because, as we all know, ancient Rome has been Sir Lawrence's chief theme as a painter. He has, I believe, saturated himself with the beauties and glories of Italy—as that great country was before its sun went down. He is probably the first living authority on the artwork of Greece and Rome, and that not merely on the æsthetic side, but on the practical constructive methods that were then in use.

His research has been of the widest scope. He has not been content with studying the grand structures and remains of ancient buildings. He has ventured among the tombs, both Etruscan and Lycian. He has had an eye for Assyrian bas-reliefs, terra-cotta slabs, and all those miscellaneous relics which are to him who knows how to read them a revelation of the history of the past, an index of the power and spirit of vanished nations. This is how it is that Sir Lawrence has been able to use his great gifts to portray for us the architecture of the past, particularly of Rome in all its magnificence. He is never satisfied with a mere suggestion or rough indication of a building. Every single detail, each moulding or other ornament, is most carefully and truthfully set forth. It must be the best of its kind too—something selected for its beauty, and finished and refined with perfect taste. What a wealth of material too he employs, and how he revels in the expressive qualities of each kind. Has anyone else presented, or will anyone ever present, the translucent properties of marble so well as he? Whether it be marble, stone, bronze or silver, he has studied the forms most suitable to each, that everything may be perfect both in form and colour. And then he portrays the whole for us under the sunny skies of Italy, that the beauty of the artist's work may be lighted up and intensified by the beauty and glory of the world of nature. As an indication of the interest that Sir Lawrence takes in other forms of art than that which he has made expressly his own, I may cite two well-known pictures of his, "Architecture in Ancient Rome," in which he depicts the architect engaged on his work, and another in which the sculptor Phidias is represented putting the finishing touches to the Parthenon frieze and explaining it (apparently) to his friends and patrons. He has also given us a picture of a sculptor's studio and a corresponding one of a painter's studio. Architecture figures more or less conspicuously in quite a large proportion of Sir Lawrence's paintings, as you may see by the photographs which he has kindly lent for your inspection this evening. In some it is quite a (if not the) prominent feature, as, for instance, the picture in which he has reconstructed the Roman Colosseum, and another representing the Baths of Caracalla in all their splendour—magnificent paintings, both of them, impressing us with a conviction of the absolute accuracy of every detail, such as only an architect could reproduce. I must not attempt to speak of all Sir Lawrence's paintings that contain architectural accessories—a bit of an exterior in this one, a bit of an interior in that, and so on—pictures in which the architectural element is naturally and properly limited and made subservient to the figures in the composition. But this I should like to say, that however much or however little may ultimately find place in the actual canvas, it has all been carefully planned and set up in section first. There is one of Sir Lawrence's pictures which presents a complete architectural work, filling, indeed, the major part of the canvas. I refer to the painting known as "Down the River," which contains the whole of a well-designed bridge of five arches, a reconstruction—idealised no doubt—of the celebrated bridge of Augustus at Rimini. The four piers contain good-proportioned niches occupied by bronze statues, and framed with column, cornice and pediment. The parapet is perfectly plain and, like the arches, without moulding. The bold cornice which separates parapet and arches is horizontal. The arches vary in height and evidently follow the curve of the roadway. Over the centre arch is a raised stone block panelled for lettering, and above that again a recumbent river-god. At one end of the bridge may be seen an arched entrance to the roadway. The whole treatment is simple and dignified, and the effect of the long horizontal line of the cornice is particularly good. But, as a wonderful illustration of Sir Lawrence Alma-Tadema's architectural knowledge and the clearest proof of the practical value of his archæological researches, I desire to direct your attention to the series of designs which he made for Sir Henry Irving for the scenery to illustrate Shakespeare's play of "Coriolanus." Here we have whole buildings, and even groups of buildings, exteriors and interiors, presented with a marvellous appearance of solidity, and marked not only by a wealth of beautiful detail, but also—which is perhaps more wonderful—by complete constructional fidelity. Mr. Phenè Spiers, writing of these scenes in the *Architectural Review*, makes a point of the constructive genius displayed in them, and remarks that Sir Lawrence's "interpretation, based on the most profound archæological research, of the variety of design in Etruscan architecture comes to us virtually as a revelation." Quite apart from the beauty of the colouring or the picturesqueness of the grouping, the actual designs fill us with admiration. In the Roman Forum scene, for instance, as shown in the original drawings, Sir Lawrence

Digitized by Google

has reconstructed the Forum buildings for us after a manner which we instinctively feel is absolutely true, not only to the general form and spirit of Roman work, but also to the particular period in which the play passes; and as for detail, even the construction and framing of the timbers are carefully shown. In the widely projecting timber eaves which constitute a striking feature in the typical Etruscan temple the artist has treated a somewhat difficult problem. This great projection (over 7 feet) of the beams which support the boarding of the roof and gutter was intended to protect the wall decorations beneath them. But these single beams, relatively to the whole, look thin and weak; so Sir Lawrence added two extra ones underneath of shorter length, thus dividing the projection into three parts. He also terminated each timber end with a bracket, just as we see in some of those old ceilings where the joists are exposed and the span is great. Mr. Spiers, himself no mean authority, speaks of this treatment as both original and effective. Then there is the house of Tullus Anfidius—a beautiful design with a projecting and overhanging balcony of wood, full of detail, evincing great technical knowledge. The charm of the whole scene in which this is presented will not easily be forgotten. In another scene there is a very striking entrance doorway or projecting portico, the upper part of which, covered in by a semicircular roof of bronze plates, forms a kind of outlook. The constructive timbers with their tenons and pins are all carefully shown in this design. The general form has been probably suggested by some old tomb, but the details are fresh and original. Amongst the beautiful interiors presented in these designs we may mention the Senate House and Coriolanus's house. In the latter the excellence of the plan, the beauty of the colouring and the effects of light and shade attract our attention and excite our admiration. The arrangement of the Senate House is simple and withal impressive. The beautifully moulded square Etruscan piers, enclosing the hemicycle of stone seats ranged in tiers above one another, are very fine in scale, their apparent size being increased by their contrast with the small figures of the projecting Etruscan frieze above. Between the piers and the frieze is an architrave marked by a curious and effective square block corbel.

I have indicated a few of the most striking features in this wonderful series of designs, but no words of mine can convey any adequate conception of the amazing wealth both of knowledge and of skill to which they bear witness. When we consider the many and varying elements which go to make up their truth and their beauty we can only wonder that they all fall within the scope of one man's powers. To one of the rarest gifts as a painter Sir Lawrence Alma-Tadema adds the powers of a great architect, and endows all his work with a perfection of taste and a fulness of knowledge which in their combination are unrivalled. The rising generation, who are not too old or too proud to learn, may profit much by Sir Lawrence's example. He has shown to all men the immense importance of accurate and careful detail. He is a living witness to the truth that the ultimate refinement of all work depends upon the amount of thought and study bestowed upon each and every part. Furthermore, all his work is an illustration of the right and true use of archæological knowledge. Though he is well versed in all the forms and details in use amongst the Romans, he has not been content merely to copy and imitate their work—he has advanced it along the old lines, after the traditional manner and in the true spirit of the original. He has not cast aside the experience of the past, but has shown us how it can be rightly used and carried forward. His work has given us a true insight into the methods by which alone our beloved art can be advanced and made to live. In the presentation of the Royal Gold Medal we recognise and acknowledge Sir Lawrence Alma-Tadema's services to architecture—in promoting a knowledge of and quickening an interest in it—and we are glad to be thus permitted to honour him. He has had many honours conferred upon him. He is the possessor of the Order of Merit. He received his first gold medal at the age of twenty-six; I am not sure how many he has received since. But not one of all the many distinctions that have been conferred upon him has been bestowed with more heartfelt pleasure and more real esteem than the medal I have now the honour of presenting.

The President then made the presentation.

Sir L. ALMA-TADEMA, in replying, said:—The sun has often shone upon me in the course of my life, but it has never warmed me more than at this moment, when the apostles of architecture have bestowed upon me that great distinction, the Royal Gold Medal, for services rendered to the well-beloved sister art. Our kind President has honoured me by explaining to you my connection with architecture; and I am proud to think that my poor services to an art which I love beyond expression have been thought worthy of consideration, although, when I compare my achievements with my love, it seems to me that I have done very little. The sister arts have always appeared to me indivisible—different parts of a single whole; and I realise that from this point of view I might be regarded as a link of some interest, my own particular art being so closely concerned with architecture that I was myself at times almost tempted to believe I knew something about it. It would no doubt be enlightening if we could point out to one another the causes that lead us each to his peculiar bent in the pursuit of a common ideal; but none of us really knows what impelled him to choose a certain pathway in the kingdom of art. Art is so manifold in its aims and expressions that it seizes every one of us in a different way, and yet in the same way; it seems to take possession of us, and forces from us different expressions of the same truth. What this truth is no man has yet been able to define: it always seems to me that art is an expression of the human mind which exists merely because it is an expression of beauty, and to quote Winckelmann's fine definition, "Beauty is one of the great secrets of nature, of which we all behold and receive the influence, but of which a general and clear understanding belongs to the eternally unfathomable truths." Indeed art is a thing about which one cannot speak or reason; yet it is a thing that fills one with emotions and expressions which one spends one's life trying to communicate to one's fellow-creatures, in the silent language of one's craft; if once art has a foothold in a man's nature it masters him and forces him to do this, it convinces him that he is bound to communicate his impressions, that he may not keep them to himself, and that there is no happiness for him unless he can share with all the world that which possesses him so deeply. Every artist is conscious, therefore, that he has little to say concerning his artistic aims and ideals beyond what can be read in his work. I have taken the liberty of showing you, by permission of the President and Council, a few reproductions of my pictures, in order to prove to you how greatly my mind has always been pre-occupied by architecture in the execution of my own art. I should, of course, have preferred to show you the pictures themselves, but, with the exception of a few, they are all abroad. You will see that in some I have tried to reconstruct antique buildings; in others I have been concerned with the proportions of figures to architecture—I am even showing you a composition of a Gothic entrance to a cathedral, exhibited as long ago as 1857, to prove to you that my very beginnings were architectural; and a painting of the church of St. Clemente in Rome, dated 1863, will show you that during my first visit to Italy, at a moment when I was steeped in studies of the Merovingian period, I was mainly pre-occupied by the study of Early Christian churches. I cannot sit down without a sincere expression of gratitude to the President for his all too kind words of goodwill towards me and my art, and to you, ladies and gentlemen, for the way in which you have sympathised with me in the receipt of this honour, which, I am happy to feel, has met with the approval of His Majesty.

The PRESIDENT said if they looked at the reproductions the works of their honoured Fellow he thought they would admit that the large number of pictures were planned out with architecture in the composition. They would have an opportunity, he said, of viewing the engravings and photographs arranged around the room, but before they did so he would ask Sir Lawrence to say a few words on the collection.

Sir L. ALMA-TADEMA in his remarks said the painter had a great advantage over the builder—the architect—because he would sometimes be asked to repeat the theme of his pictures, whereas no client, the speaker fancied, had ever commissioned an architect and allowed him to work from old plans.

Sir ASTON WEBB, R.A., proposed a vote of thanks to the President who had served them so well during the two years he had held office. As their President he had guided the affairs of the Institute with judgment, and the position had required great discretion and tact during the last two years. As an architect they all honoured him for his work and for the individuality shown in it. Mr. Belcher worked on traditional lines, but in all his buildings there was that individuality of character which they looked for in all good

Digitized by Google

architecture. As a man he had been faithful and just in his relations with others.

Mr. JOHN SLATER formally seconded the motion, and amid great acclamation the President briefly replied and the meeting terminated.

THE SCHOOL OF ARCHÆOLOGY IN ROME.

IT may be said with truth and without exaggeration that the English visitors who go to Rome every year may be counted by the thousand. Many of these are, says a correspondent of the *Liverpool Courier*, of course, tourists of the kind with whom we are familiar at Blackpool and Llandudno, worthy folk intent on seeing the world and pleased at the way in which modern Italian taste has smartened up old Rome. These find ineffable joy in the new post office, the new synagogue, the new tunnel under the Quirinal and the instalment of electric light in the Corso. They are relieved to find that the ruins are not more ruinous than they are and that there are not more of them. They are interested in all that they see, but are not very interesting themselves.

There is, however, a smaller class of Englishmen who go to Rome as often as their means will admit, but their journey is in the nature of a pilgrimage to a holy shrine. They have been brought up as scholars, and for them ancient and historic Rome has a message more important and more weighty than even Mediæval Rome, with its stately but somewhat barbaric pomp. Some even of these scholars are at a loss to find their way amongst the maze of antiquities of the Eternal City, and none can be surprised at this when we reflect on the fact that some 3,000 years have passed since Rome was built, and that natural decay has been busy from the earliest times in causing the historical buildings of one generation to disappear and to be replaced by those of another generation. Besides this, sieges innumerable, huge fires, floods and, above all, base Mediæval nobles by their ravages have done their very utmost to make a gulf between the Rome of past history and the present time. As fortune has willed it they have not succeeded, and Rome still remains, in spite of barbarian foe and of her own traitorous sons, the magnetic city, which draws to her all those to whose heart history, religion or art makes any appeal.

It is natural to expect that all civilised nations should vie with each other in the honourable rivalry of disinterring the ruins of the past, and in reconstructing history by the aid of their efforts. And as a matter of fact Germany, France, the United States of America and England have each established a school of archæology in Rome, whose object it is to investigate such antiquities as may be unearthed, and to publish the results to the world. Of the countries named, the first three give a handsome subsidy at the Government's expense towards the upkeep of the school, and this is notably the case with Germany and France, whose contributions to archæology have been very great and continuous. England until the last year or so has contributed absolutely nothing as a nation, and the school has been "run" by the unselfish and unpaid efforts of some enthusiastic Oxford students, while the rent of the buildings and the upkeep of the scanty library has been defrayed by the subscriptions of private individuals who happened to take an interest in archæology.

It should be made known then to British scholars visiting Rome that the British Archæological School is situated in the Palazzo Odescalchi, Piazza dei Santi Apostoli, in Rome. A new director has been appointed in the person of an Oxonian, who had long given his services to science and to his countrymen for nothing. The director brings out every year a book containing a description of the most recent archæological discoveries in Italy, and containing also a description of the researches which either he or his colleagues have made during the year. Unfortunately for us the Italian Government will not permit any citizen of a foreign Government to excavate, and unfortunately for science the Italian Government has not the money to spend in excavating the enormous amount of land which is known to conceal treasures of art.

Still, even without excavating, there is much for a school of archæology to do in Rome. The director, Mr. Ashby, and his colleagues range over the Campagna and hardly ever return without identifying some site and stumbling on some treasure, for it must be remembered that the Campagna is in many ways only partially explored, and the Romans themselves are most incurious as regards their own antiquities. Besides this the officers of the British Archæological School make it their duty to conduct scholars round the Forum and Palatine and other resorts which offer the greatest attraction to antiquarians, and offer their services to aid such visitors to enable them to examine with profit the different remains of centuries of civilisation. They boast, too, a library in which scholars can read and write and find books of reference, and friends to answer questions. In return for their services the director and his colleagues are very anxious to secure donations of books for their library and of money to extend their operations.

Those who have not lately been in the Eternal City are perhaps unaware how many new and interesting facts have been brought to light by recent excavations. The ancient sepulchres found in the Forum Romanum have proved what sort of men lived on the site where Rome afterwards stood before that city was founded. The passages which have been laid bare in the Colosseum have shown us the way in which the wild beasts were forced on to the arena, there to prey upon their unfortunate victims. New houses have been unearthed on the Via Appia, notably one close by the Porta Sebastiana, which exhibits to us exactly the way in which a great Roman nobleman had his home and its surroundings constructed. We trust, then, that some of the many strangers who pass their winters in the Eternal City may see their way to support an institution which lays itself out to aid all British subjects resident in Rome.

LONDON COUNTY COUNCIL COMMISSIONS.

IT appears that numerous inquiries have been received from influential auctioneers and surveyors as to whether the London County Council would be prepared to pay them commission in the event of their introducing tenants for the surplus land from the Holborn to Strand improvement. The improvements committee consider that it is to the Council's interest to allow its officers to conduct negotiations for the disposal of its surplus property, but that if it were known that commission would be paid in those cases where a letting was effected through an introduction by an agent, it might be possible for the Council to secure tenants who would not otherwise entertain the idea of dealing with its property. It is the general practice throughout the profession for commission to be charged by and paid to surveyors, &c., in such cases. The usual commission in respect of property in the central parts of London is half a year's ground rent, but in the case of suburban property one year's ground rent is generally allowed. Having regard to the valuable character of the surplus land from the Holborn to Strand improvement, it is thought that commission should be paid at a less rate per cent. than in the case of ordinary property. A scale of commission has accordingly been framed as follows :—

Annual Rent.	Suggested Commission.	Annual Rent.	Suggested Commission.
£	£	£	£
500	125	4,500	450
1,000	150	5,000	500
1,500	175	5,500	550
2,000	200	6,000	600
2,500	250	6,500	650
3,000	300	7,000	700
3,500	350	7,500	750
4,000	400	10,000	1,000

It will be noticed that the suggested commission varies from one-fourth of a year's rent in the case of a letting at 500*l.* a year to one-tenth of a year's rent in lettings of from 2,000*l.* to 10,000*l.* a year, so that if by the payment of commission the letting of a site were accelerated by only three months the Council would gain financially, whilst in the case of the more valuable sites the Council would gain if a letting were accelerated by only five weeks. The committee believe that the modified scale of commission would be accepted by the profession. The minimum annual rent of the unlet portion of the surplus land from the improvement, even after the letting at 55,000*l.* a year of the central portion of the Strand crescent site shall have been completed, may be estimated at a sum approaching 100,000*l.* The committee are strongly of opinion that, as a means of expediting the disposal of the land, the Council should agree to the payment of commission as suggested above. They desire, however, to direct particular attention to the fact that the arrangement will only apply to land from the Holborn to Strand improvement, that all negotiations for the letting of the land will be conducted as heretofore by the Council through its own officials, and that the commission will only be payable in those cases in which a letting is actually effected as the result of an introduction to the Council.

NOTES AND COMMENTS.

THERE is so little remaining above ground of the Temple of Juno Lacinia, near Cotrone, in Calabria, the intervention of the Italian Government to protect the remains cannot be of much advantage. The greater part of the masonry was utilised for the construction of a mole for the protection of the little harbour of Cotrone. Careful excavations might, however, reveal the plan of the building. Probably no other temple received so much praise from poets. Although distant from Greece, countless votive offerings were sent to it. The renowned painting by ZEUXIS of HELEN OF TROY was deposited there. In order to be able to paint the figure, the artist was allowed to select five of the most beautiful women in Cotrone to serve as models. How he was able to use so many for a single figure has been debated by writers on æsthetics. ZEUXIS was also permitted to exhibit the *Helen*, and was said to have made so much money he could afterwards dispose of his pictures gratuitously. People used to come to Cotrone from all parts of the then civilised world in order to gaze upon the painting. A Doric column which has survived is 26 feet high, but it is inadequate to give a notion of a temple that in times of war was considered sacred and was spared.

THE annual Congress of the Société Centrale des Architectes, which this year was presided over by M. NENOT, came to a close on last Saturday. The premiums were distributed by M. DUJARDIN-BEAUMETZ. The principal awards were as follows:—Médaille d'honneur to M. DUCHATELET, architect, Paris; Prix Dejean to M. CORDONNIER, architect, Lille; large silver medal for private architecture to M. SIBIEN, architect, Paris, and to M. LEMAIRE, architect, Valenciennes; silver medal for archæology to M. DUFOUR, architect, Paris; silver medal for jurisprudence to M. EWALD, architect, Paris; large silver medal for students of the schools of France in Athens, Rome and the East to M. ALBERTINI, member of the School of Rome; large silver medal for studies of French monuments to M. VENTRE, architect, Paris.

ACCORDING to Mr. G. C. HYDE, great care should be exercised in the introduction of ornamentation in the buildings erected in earthquake districts. Throughout the devastated district in San Francisco, great blocks, stone spheres of masonry, carved figures, &c., were thrown to the ground by the force of the oscillations, and had the disaster occurred at a time when the streets were crowded with people it is safe to assume that great numbers of lives would have been sacrificed. It is also suggested that cornices should everywhere be constructed of very light material, which should be anchored in a firm manner to metal supports forming a part of the steel or other framing of the structure. In no case should heavy projecting masonry be used for cornicework, no matter how apparently well anchored it may be. Ordinary mortar is another source of danger in such districts as San Francisco. Mr. HYDE observed many cases of brick walls unexposed to fire which were found to have practically no tensile strength—hardly as much as would have been secured by the use of well-selected and well-tempered clay. Such masonry was destroyed by the earthquake, and in its destruction caused very considerable loss of life. But if the earthquake had occurred at a less fortunate time, this poorly constructed masonry would have been responsible for a far larger number of deaths. Properly designed and executed masonry employing Portland cement mortar was found to have withstood the force of the vibrations reasonably well.

THE position of St. George's Hospital is undoubtedly one of the most commanding in the Metropolis. To have an hospital on a site of the kind impresses foreigners with a belief in English benevolence. Like other hospitals which were erected several years ago, St. George's has many defects, and the whole staff have agreed in a report that rebuilding will sooner or later become essential. At the same time they are not in favour of removal. The treasurer has been, however, endeavouring to obtain offers for the ground. But the minimum sum required is 400,000*l.* As yet no speculator has offered that amount. The estimated cost of rebuilding the hospital on the present site is 350,000*l.* If some of the adjoining property were purchased, additional wards could be found by an outlay of 120,000*l.* Under the circumstances it is difficult for the governors to come to a decision. After a long debate on Tuesday the resolution adopted two years ago was reaffirmed, viz.:—"That it is not desirable at the present time and in the existing circumstances to remove St. George's Hospital from its present site."

THE second part of "The American Vignola," by Professor WARE, has appeared after an interval of about three years. It relates to arches and vaults, roofs and domes, doors and windows, walls and ceilings, steps and staircases. General directions are first given concerning the treatment which should be followed according to Italian practice mainly, and the diagrams are of the kind which is adapted to elucidate principles. In other words, the parts are treated as if architecture was identical with construction. In the supplementary plates ornament is not eschewed. In that way the skeleton as well as the outer clothing are suggested in their true relations. Professor WARE understands the needs of a student, and he supplies it as far as is necessary with Italian work. The book can be obtained from Mr. BATSFORD.

ILLUSTRATIONS.

NEW OFFICES FOR THE HEARTS OF OAK BENEFIT SOCIETY, EUSTON ROAD, N.W.

WE have already given some views of the interior of the new offices of the Hearts of Oak Benefit Society, which were opened by HIS MAJESTY on Saturday, June 2. When the character of the majority of the houses in the same thoroughfare is remembered the introduction of so effective an example of modern Renaissance must have a beneficial effect which will lead to rebuilding of many premises. The courage, good taste and public spirit of the society are demonstrated by the character of their offices, and the possession of so telling and enduring an advertisement was a wise appropriation of funds. The architects are Messrs. ESSEX, NICOL & GOODMAN, of Birmingham, who have been aided by the designing power of Mr. NICOL, jun.

NEW PREMISES FOR MESSRS. WARING & GILLOW, LTD., OXFORD STREET, W.

THE view now published represents Messrs. WARING'S new building without any interruption from other premises. Although Oxford Street contains many skilful examples of architecture, the new building has characteristics by which it asserts itself. For a business like Messrs. WARING'S that is an advantage. Importance is also attached to the treatment of the ground floor by which the space for exhibiting goods is increased. Mr. R. F. ATKINSON is the architect.

HAWSTED HOUSE.

ONE of the most interesting of the Suffolk mansions is that which is sometimes called Hardwick House, and stands within about five miles of Bury St. Edmunds. In the seventeenth century it was known as Hawsted House, Hawsted Place, or The Place. It was one of the mansions visited by Queen Elizabeth. Her Majesty rode in the morning from Sir William Cordell's at Melford and dined with one of the Drurys at Lawshall Hall, about five miles distant from Hawsted. This visit is thus recorded in the register of that parish under the year 1578:—"It is to be remembred that the queen's highnesse in her progresse, riding from Melford to Bury 5° Aug. Regineque 20 annoque D'næ predicto, dined at Lawshall Hall to the great rejoicing of the said parish and the country thereabouts. In the evening she came to Hawsted; her apartment there ever afterwards as usual retaining her name. Tradition reports that she dropped a silver-handled fan into the moat. It was at this time perhaps that the royal guest bestowed the honour of knighthood upon the master of the mansion."

It was this Sir William Drury who, it is believed, rebuilt or greatly repaired Hawsted House. Hawsted House might be confused with other ancient mansions if it were not that in the eighteenth century an ample description of it was prepared and which is now reprinted:—

Its situation, as of many old seats in the neighbourhood, is on an eminence, gently sloping towards the south. The whole formed a quadrangle 202 by 211 feet within, an area formerly called the "Base Court," afterwards the "Court-yard." Three of the sides consisted of barns, stables, a mill-house, slaughter-house, blacksmith's-shop and various other offices, which Harrison, in his description of Britain, tells us began in this (Elizabeth's) reign to be thrown to a greater distance from the principal house than they were in the time of Henry VIII. The entrance was by a gatehouse in the centre of the south side, over which were chambers for carters, &c. This was afterwards laid open and fenced with iron palisades. The mansion-house, which was also a quadrangle, formed the fourth side, standing higher than the other buildings, and detached from them by a wide moat, faced on all its banks with bricks and surrounded by a handsome terrace, a considerable part of which commanded a fine view of the surrounding country, and bespoke a taste superior to the artificial mount, which in many old gardens was to be clambered up for the sake of the prospect. The approach to the house was by a flight of steps and a strong brick bridge of three arches, through a small "jealous" wicket formed in the great well-timbered gate that rarely grated on its hinges.

Immediately upon peeping through the wicket the first object that unavoidably struck the sight was the stone figure of Hercules, as it was called, holding in one hand a club across his shoulders, the other resting on one hip, discharging a perennial stream of water into a carved stone

Digitized by Google

basin. On the pedestal of the statue is preserved the date, 1578, which was the year the Queen graced this house with her presence; so that doubtless this was one of the embellishments bestowed upon the place against the royal visit. A fountain was generally (yet surely injudiciously in this climate) esteemed a proper ornament for the inner court of a great house. This was supplied with water by leaden pipes, at no small expense, from a pond near half a mile off. Perhaps the figure might be designed to represent a wild man or savage, having no attribute of Hercules but his club, and all his limbs being covered with thick hair and his loins surrounded with a girdle of foliage. He resembles much the supporters of the arms of the families of Berkley of Stratton and Sir John Wodehouse. *Hombre salvagio*, just come out of the woods with an oaken plant in his hand and overgrown with moss and ivy, was one of the personages that addressed Queen Elizabeth at her famous entertainment at Kenilworth Castle.

The inner court, as it was called, in which this statue stood, and about which the house was built, was an area of 58 feet square. The walls of the house within it were covered with the pyracantha of venerable growth, which, with its evergreen leaves enlivened with clusters of scarlet berries, produced in winter a very agreeable effect.

Having crept through the wicket before mentioned, a door in the gateway on the right conducted you into a small apartment called the "smoking-room," a name it acquired probably soon after it was built, and which it retained with good reason as long as it stood. There is scarcely any old house without a room of this denomination. In these our ancestors from about the middle of the reign of Elizabeth spent no inconsiderable part of their vacant hours, residing more at home than we do, and having fewer resources of elegant amusement. At one period at least this room was thought to be the scene of wit, for in 1688 Mr. Hervey, afterwards Earl of Bristol, in a letter to Mr. Thomas Cullum, "desired to be remembered by the witty smokers at Hausted." Adjoining to this was a large wood closet and a passage that led to the dining-room, of moderate dimensions, with a large buffet. These occupied half the south front. At the end of the dining-room was originally a cloister, or arcade, about 45 feet long, fronting the east and looking into a flower garden, within the walls of the moat. The arches were afterwards closed up and glazed and a parlour made at one end. There are few old mansions without one or more of these sheltered walking places, and they certainly had their use; but this age of list, sand-bags and carpets, that dreads every breath of air as if it were a pestilence, shudders at the idea of such a body of the element being admitted into any part of a dwelling. This cloister was terminated by the spacious and lofty kitchen, still standing, and well supplied with long oaken tables.

On the left-hand of the entrance, and opposite the smoking-room, was the chapel, a room of state, much affected by the whole manorial lords, who seem to have disdained attending the parochial church. The last sacred office performed in it was in July 1733. Through this was a door into the drawing-room or largest parlour, which, with the chapel, occupied the other half of the south front. Adjoining to the parlour was a large gloomy hall, at one end of which was a screen of brown wainscot, in which was a door that led to the buttery, &c. These formed the west side of the square. Beneath these apartments and those on the south side were the cellars, well vaulted with brick. The north side was occupied by the kitchen, and at the back of it was a drawbridge. These were the apartments on the ground floor, which was raised 12 feet above the surface of the moat. Over the gateway, chapel and largest parlour were the royal apartments, which were approached by a staircase out of the hall. On this staircase, against the wall, stood some painted boards, representing various domestic servants. Several bedchambers of common proportions occupied the chief part of the rest of the first storey. Among the rooms on that floor was one called the still-room, an apartment where the ladies of old amused themselves in distilling waters and cordials, as well for the use of themselves and of their poor neighbours as for several purposes of cookery. In this room stood a death's head, no improper emblem of the effects of the operations carried on within it.

Contiguous to one of the bedchambers was a wainscotted closet about 7 feet square, the panels painted with various sentences, emblems and mottoes. It was called the painted closet; at first probably designed for an oratory and, from one of the sentences, for the use of a lady. The dresses of the figures are of the age of James I. This closet was therefore fitted up for the last Lady Drury, and, perhaps, under her direction. The paintings are well executed and now put up in a small apartment at Hardwick House.

The following sentences, which are intelligible enough, are in cartouche scrolls in narrow panels at top:—Quod sis esse velis nihilque malis. Summam nec metuas diem, nec optes. Quæ cupio, haud capio. Parva, sed apta mihi: nec tamen hic requies. Nunquam minus sola, quam cum sola. Amplior in cœlo domus est. Frustra nisi Dominus.

Among the emblems with mottoes are:—(1) A monkey sitting in a house window and scattering money into the street. Ut parta labuntur. (2) A camel trampling in dirty water. Pura juvent alios. (3) A fire on the banks of a river. Dum servi necessaria. (4) A painter having begun to sketch out a female portrait. Dic mihi qualis eris. (5) A human tongue with bat's wings and scaly contorted tail mounting into the air. Quo tendis? (6) A tree with sickly leaves and a honeycomb at its roots; near it is another quite leafless. Nocet empta dolore voluptas.

Altogether there are about fifty examples. The bottom panels are adorned with flowers in a good taste.

The windows, in general, were spacious, but high above the floors. In still earlier times they were very narrow as well as high, that they might be more difficult marks for the arrows of an enemy, and that, if the arrows did enter, they might pass over the heads of those that were sitting. After this, precaution was needless; the windows, though enlarged, continued to be made high, even till modern days. The beauty of landscape, so much studied now, was then but little or not at all regarded; and high windows, when opened, ventilated the apartments better than low ones, and when shut the air they admitted was less felt.

On two porches, between which stands the figure of Hercules, are still extant in stone the arms of Drury, consisting of sixteen quarterings, and those of Stafford of Grafton, with a canton ermine and five other quarterings. This circumstance, corroborated with the general style of the building and the date on the pedestal of the statue, induces one to believe that this house was rebuilt or thoroughly repaired by that Sir William Drury who married a lady of the name of Stafford, and who succeeded to the estate upon the death of his grandfather in 1557. The oak panels of the wainscot of one of the rooms at Hardwick House are all marked in gold with the Stafford knot, the cognisance of that family.

The walls of the house were chiefly built of timber and plaster. The plaster in the front was thickly stuck with fragments of glass, which made a brilliant appearance when the sun shone and even by moonlight. Much of it still remains and appears to be but little injured by centuries—perhaps will survive the boasted stucco of modern artists. This excellent composition contains plenty of hair and was made of coarse sand, abounding with stones almost as big as horse beans. And in some of the old walls round the house where the bricks have crumbled away the layers of mortar continue sound and support themselves by their own compactness. The art was not lost even in the seventeenth century, for some plaster on an outhouse, which bears the date 1661, still remains perfectly firm. This house was no bad specimen of the skill of former artists in erecting what should last. Part has been taken down, not from decay, but because it was become useless. The mode of its construction contributed towards its durability, for the tiles projected considerably over the first storey, and over the ground floor, so that the walls and sills were scarcely ever wetted.

In the year 1685 this house paid taxes for thirty-four fire-hearths, two shillings each hearth.

The banks of the moat were planted with yews and variegated hollies, and, at a little distance, surrounded by a terrace that commanded a fine woodland prospect. Here were orchards and gardens in abundance, and a bowling-yard, as it was called, which always used to be esteemed a necessary appendage of a gentleman's seat.

This place was well furnished with fish ponds. There is near it a series of five large ones, on the gentle declivity of a hill, running into one another, the upper one being fed with a perennial spring. There is another similar series of small ones that served as stews. These must have been made at a very heavy expense, but they were necessary when fish made so considerable a part of our diet as it did before the Reformation, and when bad roads made sea fish not so easily procured as at present.

There was also a rabbit warren in the park, a spot that would have borne good wheat. But it was, like a pigeon-

Digitized by Google

house, a constant appendage to a manorial dwelling. In the eighth year of James I. a stable near the coney warren was let with the dairy farm, and even in the next year we hear of the warrener's lodge.

One principal reason of the number of warrens formerly was the great use our ancestors made of fur in their clothing. "I judge warrens of coneys," says Harrison, "to be almost innumerable, and daily like to encrease, by reason that the black skins of those beasts are thought to countervail the prices of their naked carcasses." The latter were worth 2½*d.* a piece, and the former 6*d.* 17 Henry VIII.

The following summary description of Hawsted appears in a survey of the manor taken in the year 1581 :— "Willielmus Drury miles, dominus hujus manerii, habet in manibus suis scitum manerii de Buckenhams, in quo inhabitat, quam optime constructum, cum uno curtilagio, gardino, uno le mote circumjacente, uno le traves ante portam messuagii predicti, et unam magnam curiam undique bene edificatam, cum stabulis, orreis, pistrino, le dayery howse, et aliis edificiis necessariis et aptis pro manutencione capitalis messuagii predicti, et uno orto sive pomario, ex parte orientali messuagii et magne curie predicte."

Sir William Drury was elected one of the knights of the shire in 1585, and in 1589 was killed in a duel in France. His corpse was brought into England and interred in the chancel here, where a fine marble bust of him in armour still remains.

THE CAPETOWN COMPETITION.

IT would be strange if the decision in the competition for the Law Courts, Capetown, should differ from the majority of such cases in being accepted without protest. The site was bounded by two streets. Forty-two out of the forty-four competitors placed the principal entrance in the more important Queen Victoria Street. The two who placed it in Keerom Street secured the first premium. Among the memorials from societies to Dr. Smartt, the Commissioner of Works, is the following :—

We, the President and Council of the Transvaal Institute of Architects, desire to call your attention to the following facts connected with the recent award in the above competition.

The dominant feature of the best law courts in Europe is almost universally the public entrance and the central hall leading from it, which are considered as representing the architectural expression of the dignity of Justice. The new Capetown Courts will face one fine main street and one mean back one. The problem of the plan depended, therefore, upon the choice of streets for the public entrance. All other difficulties in the plan hung in the main upon this point.

It was expressly stated, however, on the secondary conditions issued to competitors, that "Queen Victoria Street is the most important thoroughfare." We claim that this condition clearly implied that the public entrance should be in this street, and all the work of competitors started from this fixed point.

We now find to our dismay that the *one* design which ignored and reversed the important condition is the one awarded the first prize in the competition.

We do not for a moment impute any bad faith to the assessors, nor cast any aspersion upon the successful design, but we do seriously consider that by ignoring in the award the fair and reasonable intent of the conditions a great injustice has been done to the architects of South Africa, who, through no fault of their own, wasted an immense amount of time and money in what was an absolutely useless quest from the outset; that damage has been done to the cause of architecture and the whole system of architectural competition in South Africa, and that in this case the Government of Cape Colony has not had any benefit from the competition of architects for the new Law Courts.

We respectfully beg that this memorial may be duly considered by the Government, and its decision communicated to us.

The following is the official reply :—

Sir,—With reference to your letter of February 14 last, to the memorial subsequently received from the Cape Society of Architects, and to representations which have been put forward respectively by the Presidents and Councils of the Natal and Transvaal Institutes of Architects, I am directed to inform you that the issues involved have received the Commissioner's careful consideration.

The question now at issue arises directly from the request preferred by the Cape Society of Architects for the publication of the award of the advisory committee and the professional assessor.

The desire then expressed was that publication of the assessor's report might be made, for the reason that, having regard to the importance and national character of the contemplated building, the general public might fairly ask to be made acquainted with the grounds for the award. If, however, this view were not entertained, it was thought that the competitors, who unitedly had incurred substantial outlay in the preparation of designs, should be furnished with a copy of the assessor's report.

Publication being deemed unnecessary, the circumstances under which the decision upon the competition was arrived at were conveyed to you by letter of February 10 last.

Your reply of February 14 indicated that, in the view of the Cape Institute, the exhibition of the designs had disclosed a unique and unsatisfactory position which called for action in the interests of the whole of the profession in South Africa ; and that the request for publication of the award had been preferred in the hope that by this means information would be obtainable as to the reasons which led up to it.

Failing publication, however, the Institute proceeded to formulate their objections to the confirmation of the decision on the grounds in brief that—

On examination of the original conditions, issued in May 1905, it was found that one indispensable piece of information had been omitted, viz. an intimation as to which of the streets bounding the site was the more important.

In respect to this point the memorial states :—"In view of the absence of definite information upon this and other points, a list of queries was forwarded to the Public Works Department, among them being the following :—'Which is the more important of the streets concerned, Keerom Street or Queen Victoria Street, and into which should the chief entrance open ?'

"The Public Works Department replied to this query in the following terms :—'Queen Victoria Street is the more important thoroughfare.'"

In regard to the "list of queries" referred to, I am to point out that (as will be seen from the printed memorandum issued on August 24, copy of which I enclose) the particular point in question was not included amongst the queries raised by the Cape Institute.

The inquiry emanated from two individual competitors, and the fact that it was not embodied in the representations from the Institute dated August 4, 1905 (some months subsequent to the publication of the conditions), appears to be inconsistent with the claim now preferred, that on examination of those conditions it was found that information on this point, which the Institute considered indispensable, had been omitted. Under no circumstances can the reference to the relative importance of the streets be regarded, as it is termed in the memorial, "the chief of the conditions," for if this were so it is inconceivable that the Institute could have overlooked its absence in their official representations.

It is clearly to be inferred from the terms of the memorial above quoted that the point as to the relative importance of the boundary street was raised by the Institute, and it is therefore evident that some misapprehension exists, since the reference to this particular subject in the printed memorandum was solely due to the fact that, in order to insure absolute equality of treatment for all competitors, an addendum to the Institute's queries was compiled by the Department from the inquiries made by individuals.

In respect to the reply given to the particular query in question, the memorial further states, "This reply was taken to be a fair answer to the query." To this no exception is taken ; but the Commissioner regrets his inability to follow the further remark, viz. that this reply was taken "to clearly imply that the chief entrance was to be in Queen Victoria Street."

The exact terms of the competitors' original inquiries were :—

> "Will you kindly tell me which is the more important street, Keerom Street or Queen Victoria Street ? We require to know this so as to know which should have the most important elevation to it."
>
> "We should like to know which is the most important of the two streets, Keerom Street or Queen Victoria Street, and into which should the principal entrances open ?"

Digitized by Google

And it will be seen, therefore, that the reply is strictly confined to such terms as would convey a statement of fact, which was well within the knowledge of the main body of competitors and was ascertainable without difficulty by the comparatively few who may not have possessed any acquaintance with local circumstances, and that advisedly it refrained from affording foundation for any contingent implication or deduction upon points in which it was considered essential that free scope should be left for the unfettered exercise of individual judgment.

The point which the memorial advances as practically the pivot of the whole matter was not in any way an item of the original conditions of competition, though, of course, it cannot be entirely excluded from all reference to them, since it appears in the series of replies to inquiries arising out of these conditions. These replies were not, however, as they have been termed by the Transvaal Institute, "a series of secondary conditions," but were merely replies to inquiries received; issued in a convenient form as a matter of courtesy, and circulated to all competitors alike in order to insure absolute equality.

The fact that some at least of the competitors—even though it may be a small percentage—were found to depart from the solution adopted by the majority is not without its importance as an indication that even by competitors the point was not regarded as so essential and primary a condition as the Institute now feels it to be, or that the information furnished bore, of necessity, the construction placed upon it in the memorial.

It is apparently argued that the question of design hinged upon the selection of a suitable position for the judges' rooms. In respect to this the Commissioner does not propose to go further than to point out that such a matter would be entirely one of internal arrangement, and therefore one to be left to the judgment of individual competitors. He desires, however, to reiterate that all information given was studiously avoidant of any indication of preference for any particular arrangement of the features of the proposed building.

The memorial proceeds to dissociate the Institute from casting any reflection upon the committee or assessor, an attitude which is also assumed by the Transvaal Institute, who specifically repudiate any implication of bad faith, while, as regards the value of the design both Institutes deny any desire to cast aspersions upon it. Ultimately, however, the memorial crystallises the point of the complaint in the statement that the assessor or committee has "apparently ignored the circumstances." This, it is felt, cannot be construed as otherwise than tantamount to an expression of the view that these gentlemen did not give due regard to the information upon which their judgment had to be formed. Upon this point the Transvaal Institute expresses the view that "by ignoring in the award the fair and reasonable intent of the conditions a great injustice has been done to the architects of South Africa." This is somewhat different from the view of the Cape Institute, but, taken together, the effect of the two arguments cannot be regarded as other than an expression of opinion that the body of gentlemen appointed for the deliberate consideration of the competitive designs, and contingently of all matters and documents leading up to the production of those designs, had failed to give due weight to the data placed before them.

Since any such view would project far in the direction of impugning the action of the gentlemen referred to, at least to the point of laxity or neglect, the Commissioner feels that the Institute will on consideration concur with him that any such aspect of the matter is hardly open to further discussion.

The due observance of all requirements of professional etiquette and professional practice were, it is considered, amply provided for in any respect in which non-professional experience might possibly have been lacking, and this special feature apart and upon any general issue of whatever nature Dr. Smartt feels assured that no scintilla of complaint would be justifiable.

Under these circumstances, therefore, while Dr. Smartt deeply regrets that an honourable and important section of the community should conceive that they have any cause for dissatisfaction with the outcome of the competition (the results of which, he is given to understand, have been in the highest degree creditable not only to individual competitors, but to the profession as a whole) he feels that, in the circumstances as they are now before him, and as he is not prepared to query or interrogate the decision which has been arrived at by the advisory committee, there is no direction in which further action can be taken in this matter.—I have the honour to be, &c.,

(Sgd.) LEWIS MANSERGH,
Secretary for Public Works.

PAULTON'S HOUSE.

A VISIT to Paulton's House, formerly the residence of Sir Hans Sloane, and now in the possession of Mr. Hans Sloane-Stanley, was permitted last week to the members of the Hampshire Field Club and Archæological Society. A paper was read on the occasion by Mr. W Dale, F.S.A., who said:—

We are here to-day by the kind invitation of a descendant of the illustrious Sir Hans Sloane, whose portrait is before you. There are three other portraits in London, one by Slaughter in the National Gallery, one by Kneller in the rooms of the Royal Society, and another by Murray in the Royal College of Physicians. The career of this famous man is so well known that I need only remind you of a few points in it. He was born in 1660, and came of an old family. In early life he was a great traveller, and all his days a collector, principally of natural history objects and books and manuscripts. As a physician he attained to great distinction in his day, and was first physician to George II. He also attended Queen Anne in her last illness, and it was by his direction she was bled, which modern doctors would probably say was the reason that there was so quickly a change in the succession. In 1727, on the death of Sir Isaac Newton, he became President of the Royal Society. In 1742 he went to live at Chelsea, where he founded the botanic gardens, which is still the property of the Society of Apothecaries, and where his name lives in the streets and squares of that neighbourhood. By his will, made in 1749, he bequeathed his wonderful collection to the nation on condition that they paid the sum of 20,000*l.* to his family. It had cost him 50,000*l.* In 1753 an Act of Parliament was passed accepting the gift. Montagu House was purchased, trustees were appointed, and so the British Museum was founded. Museums in those days were, of course, very different from what they are now, for in the first catalogue one of the objects described is "A man's breeches singed with thunder." Natural history objects are also very differently treated, and those of us who were taken as children for nature study in Great Russell Street can remember hippopotami and giraffes in a sad state of repair, with loose straws sticking out of their sides. Such things have found a home elsewhere, but the priceless books and manuscripts remain, and we must ever have in grateful remembrance the memory of Sir Hans Sloane, to whom we owe the initiation of our great national collection.

Before we separate for the purpose of wandering over this beautiful house, I have asked permission to indicate in a few sentences one or two things you should specially see. There are four pictures by Sir Joshua Reynolds, and there are two large portraits of George III. and Queen Charlotte. Our host informed me that no less than seventy-two of these portraits were painted and were placed in the various embassies, and as his ancestor was *charge d'affaires* at Paris he became possessed of a pair. In the same connection, you will also see the badge which was worn by a king's messenger. Amongst the china are some fine pieces of Sèvres and the largest Chelsea group that is known, with other valuable English china, together with some charming patch-boxes and *bonbonnières*. There is a wonderful collection of watch-dials, some of them probably dating from the time when the watch was first made at Nuremberg, early in the seventeenth century. The case of snuff-boxes is unique, for Mr. Stanley only collects those that have a royal head upon them. There are many Stuart or Jacobite relics, and especially some fine Jacobite glass. Mr. Albert Hartshorne has published a book upon "Ancient Glasses," and devotes an entire chapter to the Jacobite glass, which all belongs to the earlier part of the eighteenth century. You will see a very fine example of one of the portrait-glasses of the Young Pretender, with air twisted stem. There is a fine series of leathern black jacks, some silver-mounted and some good pewter. Pewter has of late gone up greatly in value and is much prized. The pewter here is some of the best that was made, for it bears the London hall-mark of Pewterers' Hall, viz. the Cross with the Crown over it, and I am inclined to assign it to the seventeenth century. I refrain from dealing with the furniture, but merely mention that there is a remarkable set of Queen Anne dining-room chairs and a carved oak

Digitized by Google

sideboard of 1603, quite perfect and untouched by paint or varnish. I must not omit the inevitable "Bellarmine" jug which is here well represented. These were first made in the Netherlands in the sixteenth century, and the human face upon them is said to have been designed by the Protestant party as a burlesque likeness of their great opponent, Cardinal Bellarmine. They were subsequently copied and largely made both on the Continent and at Fulham. In conclusion, he said they were all very much obliged to Mr. Hans Sloane-Stanley for affording them the opportunity of inspecting his rare collections.

The visitors were then permitted, says the *Hampshire Advertiser*, to roam at their own sweet will over the house, which is a veritable museum of priceless treasures of art and *certu*.

ROMAN ROAD, BLACKSTONE EDGE.

ON Saturday the Manchester Branch of the Classical Association visited Blackstone Edge in conjunction with the Roman antiquities committee] of Yorkshire. It would be difficult to imagine, says a correspondent of the *Manchester Guardian*, a more suitable spot where antiquarian societies from the two counties might join hands. The Roman road, which it was the object of the excursion to examine, crosses the county boundary on the top of the Pennines, which here reach a height of close on 1,500 feet. Whether this road is the finest specimen of a Roman road now remaining within the limits of the Empire or no, it was at any rate selected to form the single illustration of the article on the roads of the Empire in the last edition of Smith's "Dictionary of Greek and Roman Antiquities." It is interesting to remember also that a coloured picture of this remarkable causeway forms the first illustration in the first volume of the "Proceedings of the Lancashire and Cheshire Antiquarian Society," and that this Society arranged in its year of inauguration to pay two visits to Blackstone Edge to examine the relic. In the course of the discussions which took place on these occasions Professor Boyd Dawkins (who was then president) pointed out that the question that arose before any other was whether it was a Roman road at all. This question is still an open one, for nothing has been discovered during the twenty-three years that have elapsed to overthrow any rival theories that have been advanced. The great concensus of opinion, however, is strongly in favour of its Roman origin, and the battle of discussion rages chiefly around the remarkable trough which runs down the centre of the road. There were counted no less than twelve theories that have been advanced to explain the existence of this trough.

Those who visit the road by way of Littleborough should not fail to notice the fragment (whether *in situ* or not can only be determined now by excavation) which may be seen near the door of the little roadside inn at Lydgate. By following the wall for about 200 yards past the old oil mill a little further ahead another fragment of the road may be picked up. The causeway is then lost on the open moor for some distance till it is seen cutting its way straight over the steep face of the Edge into Yorkshire, with a gradient in some places of nearly one in four. The road is here 18 feet wide, the ashlar paving is exceedingly well preserved, the camber of the surface is easily seen, and the central trough is so well shown that one might imagine that the stones (many of which must weigh nearly half a ton) had been chiselled out within the last century. Near the summit a modern conduit has been cut right across the Roman road, which appears again, however, higher up, and at this point, just over a week ago, a very interesting discovery was made by Mr. W. H. Sutcliffe, of Littleborough, whose name in connection with the antiquities of the district will be familiar to readers of the recently issued volume of the "Victoria History of Lancashire." Mr. Sutcliffe's discovery, which consisted in the uncovering of stone foundations at the highest point of the road, no explanation of which has so far been forthcoming, added to the interest of the visit of the two societies on Saturday, but it did not prevent the visitors from devoting a large share of their attention to the famous central trough, which is a feature of the road on both sides of the Edge.

The causeway lies in the line of the road that ran (and may still be traced) from Manchester to the Roman station at Ilkley, and the section under consideration can be followed for about two miles. The fullest examination of the causeway has been made by Dr. Colley March (his measurements have recently been confirmed by Mr. Sutcliffe), and his theories as to the object of the trough are therefore most worthy of attention. They are, moreover, supported by the opinions of a number of other antiquarians. The suggestion is that the central trough acted as guide to a skid or sledge, which was used to brake the vehicles as they descended the incline. Whether the skid took the form of a sledge or a two-wheeled trolley (suggested by the double grooving of the trough), or whether the vehicle itself carried a central wheel and whether a chain or rope was worked from the top of the hill—these are questions on which the theorists have rung the changes and may safely continue to do so. One pertinent question arises, however, to which classical scholars to-day should be able to give some answer. Are we justified in supposing that the sufflamen, or "drag," referred to by Juvenal and other classical authors, ever took the form suggested by this theory?

The trough is not the only interesting feature of the causeway. Dr. March made out—and his observations were confirmed by a no less careful observer than Watkin—that the road showed what seemed to be five parallel pairs of ruts, each pair giving a gauge of 4 feet 6 inches. This is exactly the gauge which Mr. Kirk discovered in 1885 when excavating the Roman road running through Delamere Forest, and it is worthy of notice that between the wheel ruts in the forest Mr. Kirk found a trough some 10 inches deep, which it was conjectured had been worn by the horses. Approximately the same gauge is found marking the gateways of two Roman forts in Britain, and also in the streets of Pompeii, and it differs by less than 3 inches from the gauge of the old stage coach, which is still retained on our railways and tramways.

There are two other points of interest that arise, one bearing especially upon a road crossing a stretch of uninhabited country. Apparently no traces have been found in Britain, so far, of the halting-places or changing stations (*mansiones* or *mutationes*) which studded the roads of the Empire and made possible the perfect system of posting which was one source of its strength. No one can say, however, what light might be thrown on these and other questions by a systematic excavation of the remarkable stretch of road here referred to. The other question has reference to the particular forms of vehicles which traversed these roads, and whose wheels made the impressions on them which still remain. It is quite possible that the depth of the ruts found on the pavement of the Roman roads is partly due to the rude construction of some of the heavier vehicles. The wheels of the plaustrum, or cart, for example—to which Virgil makes several references, speaking of the "slowly rolling carts of Mother Ceres," and in other places of the "creaking" and "groaning" of the axles—probably consisted each of one disc of wood nearly a foot thick. The wheel ruts on the Blackstone Edge Road, however, were made by much narrower tyres. The Romans found several different forms of vehicles in use among the Britons when they came, and chariots of the same form as those found in Britain were actually used in Rome by the leaders of society. It has been conjectured that at least five or six different forms of carts and chariots may have been employed by the Romans in this country. It is quite possible that the future excavation of Roman sites, whose soil is of a nature that preserves wood (Melandra is a case in point), may give us definite information on this interesting question.

The visit of the two societies to Blackstone Edge on Saturday was rendered more interesting and pleasant by the sections and drawings supplied by Mr. Sutcliffe, by his kind hospitality and by the paper he contributed on the subject of the road.

THE JACOBSEN COLLECTIONS AT COPENHAGEN.

VISITORS to Copenhagen have long been familiar with the collections of modern and of ancient sculpture formed by Dr. Carl Jacobsen and accessible to the public—the one in the New Carlsberg Glyptotek and the other near his own house in the south-western district of the city. The two collections, says a correspondent of the *Scotsman*, are now united, and the ancient sculpture as well as the modern has been presented by its owner to the nation. A new museum for its reception, from designs by the Danish architect Kampnidian, has been built behind the New Carlsberg Glyptotek, the cost of this having been in part borne by the State, but in part by Dr. Jacobsen, who has presented a fine "Fest-Halle" of marble to be the centre of the group of galleries. On June 27 the completed building

Digitized by Google

with the two collections were to be opened and formally dedicated to the public use.

Such a collection of sculpture as Dr. Jacobsen has formed during the last five-and-twenty years demands not only a genuine artistic enthusiasm, but also taste and connoisseurship. Dr. Jacobsen's knowledge of ancient sculpture is very considerable, and he has from this point of view fully won his right to the position of director of the museum, which he will henceforth hold. The taste that has directed the formation of the collections is a catholic one, and there is really no museum in Europe where there are provided such facilities as in the Carlsberg Glyptotek for the study in the same building of characteristic examples of ancient and modern sculpture. The modern section contains many of the most representative pieces of the leaders in this art in our own day, such as Rodin, Meunier and others, and a comparison of their aims and methods with those of the Greeks is at once instructive and mentally enlarging. In the open air, in a space to be laid out at the rear of the museum, the visitor will see a bronze replica of Rodin's effective group of "The Burghers of Calais," the original of which stands just outside the town of Calais on the side towards the land. Near it will be replicas of Constantin Meunier's "Iron-Worker," and of the same artist's "Sower," while the galleries of the Glyptotek itself are filled with casts or bronze and marble replicas of works by the artists already mentioned, and by sculptors such as Barrias, Falguière, Guillaume, and other representatives of "modernité" in the plastic art. On the ancient side, moreover, not only is Greek sculpture represented, but also Roman, for a large section of the museum is devoted to a collection of Roman portrait busts, male and female, many of which show that excellence in the display of individual character for which such works are distinguished. There are, indeed, putting the Louvre and the Vatican out of the question, few better iconographic collections anywhere to be seen. There is also a good display of Etruscan art, some pieces of which, notably a group of small pediment figures in coloured terra-cotta, are of great rarity and interest. This collection was chiefly formed in Rome by the well-known archæologist, Wolfgang Helbig, and it embraces also a large number of carefully-executed copies on a large scale of the best Etruscan wall-paintings, from tombs in Corneto and elsewhere, the originals of which are not easily accessible and are in process of decay. Egyptian sculpture, moreover, has some rooms in the new museum devoted to it, and one or two bronzes here are of special merit.

The main part of Dr. Jacobsen's collection consists, of course, in antique marbles and bronzes, and he has been fortunate in having had opportunities for making acquisitions which are not likely to occur often again. Archæologists will welcome with special satisfaction the appearance in the Copenhagen Glyptotek of the very important early Greek bronze figure known as the Sciarra statue from the collection of the noble of that name in Rome. This small figure, which wants the left arm, is one of the few examples now known of a school and period that were among the most important in the annals of Hellenic art. It has long been recognised that the supreme merit of the Athenian sculpture of the days of Pericles was due to the happy blending of Dorian simplicity and strength with the sense of beauty, the richness and the vein of feeling which were an inheritance that Athens owed to the Ionian school of sculpture. Phidias himself was said to have been a pupil in the workshop of the Argive master, Ageledas, and it is of interest to know the exact kind of influence to which he would be subjected in such a centre of Dorian art. The Sciarra bronze is one of a few original pieces in different collections which are held to represent the Argive or Peloponnesian art of this particular period, and its archæological value is accordingly very great. A number of Greek heads representing, mostly in original works, several interesting schools and tendencies in ancient sculpture will well repay study, and the department of sepulchral sculpture, where again we are dealing wholly with originals, contains some charming pieces. A singularly well-preserved Hellenistic bronze Herakles is also prominent. The lover of antique art will probably, however, be chiefly attracted by the two fine marble statues of poets from the Borghese collection, which are undoubtedly the gems of the museum. One is the fine standing figure holding the lyre known as "Anacreon," the other the seated figure of a poet, distinguished by its refinement and warmth of feeling. In these works we have an example of the expressive side of Greek plastic art. The seated poet is instinct with intellect and feeling, while "Anacreon" is aglow with lyric fervour. Yet how controlled is the expression, with what suavity do the lines of the composition combine to impart to each piece a look of completeness and repose.

How different were the laws which the Greek bound himself to observe from those which guided Rodin, let us say, in his group of "The Burghers of Calais." The modern artist has cared little for the pure beauty of line in drapery or the full contour of well-nurtured elastic human flesh, so dear to the Hellenic eye. On the other hand, with infinite art he has so composed his group that, from whatever point of view we regard it, there is something to arrest the gaze—some weird face, some dramatic gesture, some tell-tale falling-in of the weeds that cling to the emaciated forms. One would say that the ugliness of gnarled joints and bony angularities had been deliberately emphasised to heighten the tragic horror of the group. The modern work is more direct in its appeal, and in the superficial aspect more real and living than the Greek, but then its effect is comparatively soon exhausted. Of the more profoundly studied and more evenly balanced antique masterpiece we can never exhaust the interest. Its very reticence and control make it the more pregnant with meaning. The longer we live with it the more we see in it of beauty and suggestion.

Reflections and comparisons of this kind are inevitably suggested by any comprehensive survey of the plastic art in its older and more modern forms, such as is afforded by the Jacobsen collection. The productions of sculpture are less generally popular than those of painting, and we should be all the more grateful when these productions in their best and most typical forms are placed before the public in such an attractive setting as the munificence and good taste of a private citizen have provided for them in the new Copenhagen Museum.

AMERICAN SOCIETY FOR TESTING MATERIALS.

THE ninth annual meeting of the American Society for Testing Materials was held at Atlantic City on June 21-23. The following remarkable series of reports and papers were to be read:—Memoirs of deceased American investigators who have contributed in a marked degree to the advance of the testing of materials, Report of committee on standard tests for road materials, The development of the test for cementing value of road materials, Notes on the hardness and abrasion tests of road materials, Report of the committee on standard specifications and tests for sewer pipes, Report of the committee on fireproofing materials, Report of the committee on standard specifications for the grading of structural timber. The subject of the annual presidential address was—The American Society for testing materials: its past and future, The national bureau of standards, Concrete column tests at Watertown arsenal, Some effects of earthquake shock and fire on materials and buildings at San Francisco, The corrosion of steel as affected by its chemical composition, Electrolytic corrosion of steel, Report of the committee on the heat treatment of iron and steel, The effect of heat treatment on high carbon steels, The beneficial effect of adding high-grade ferro-silicon to cast-iron, Report of the committee on reinforced concrete, Tests of reinforced concrete beams, Notes on the compression tests of cement, Consistency of concrete, Present status of our knowledge in regard to the constitution of Portland cement, Progress made in the investigation of structural materials during the fiscal year ending June 1906, Report of the committee on standard specifications for iron and steel, Experiments on the segregation of steel ingots in its relation to plate specifications, Fire-box steel—failure and specifications, Report of the committee on preservative coatings, Protective coatings for the preservation of steel, Practical testing and valuation of japan, Testing of shellac varnish, Report of committee on standard specifications for cast-iron and finished castings, Report of the committee on standard specifications for foundry coke, Some results of the Government fuel tests at St. Louis, Report of the committee on standard specifications for staybolts, Report of the committee on uniform speed in commercial testing, Report of the committee on the tempering and testing of steel springs, Report of committee on uniform specifications for boilers, Tension tests of steel angles, Investigation on the conductivity of concrete and the effect of heat upon its strength and elastic properties, The determination of the specific gravity of cement, A new device for the mechanical sifting of concrete aggregates, Relation between some physical properties of

Digitized by Google

bitumens and oils, Proximate composition and physical structure of Trinidad asphalte, with special reference to the behaviour of mixtures of bitumen and clay, Some sand experiments relating to the percentage of voids and tensile strength of cement mortars.

Report of the committee on waterproofing materials, Some mistakes in waterproofing, Methods of testing cements for waterproofing properties, Report of the committee on standard methods of testing, New features of two large testing machines, The Purdue University impact machine, Report of the committee on the magnetic testing of iron and steel, Complete equipment for magnetic testing, Mechanical experiences with limber and stiff rail sections, Effect of combined stresses on the elastic properties of iron and steel, Tests of metals in reverse torsion, Additional data on the Rattler test for paving brick, as disclosing the limit of permissible absorption.

BRITISH FORESTRY.

IN the House of Commons Mr. Herbert Roberts lately asked what steps have been taken to carry into effect the recommendation of the departmental committee of 1902 on British forestry, and whether any communication ha been addressed to corporations and municipalities relative to the committee's recommendation as to the desirability of planting with trees the catchment areas of their water supply. Sir E. Strachey, in reply, says :—(1) The departmental committee recommended that the Alice Holt Woods, in Hampshire, should be made available as soon as possible to serve as a demonstration area in England. This has been done. A full report as to the past history, present position and future management of these woods has been prepared by Dr. Schlich at the request of the Commissioners of Woods and Forests, and the recommendations made therein are being systematically carried out. A certain amount of experimental planting has already taken place. Copies of Dr. Schlich's report, illustrated by plans, can be had on application to the Commissioners. It was also recommended that a suitable estate should be purchased in Scotland to serve as another demonstration area. Several properties have been brought to the notice of the Commissioners of Woods and Forests, but for various reasons they did not appear suitable for the purpose. Two additional properties are now under consideration, and as soon as a suitable estate has been found the Treasury will be approached with a view to purchase. (2) The recommendation of the departmental committee that lecturers should be appointed at Oxford and Cambridge has to some extent been met by the augmentation of the salary of the Sibthorpian professor of rural economy at Oxford, who is now professor of forestry botany. It is understood that an estate will be placed at his disposal for demonstration purposes. (3) A sum of 500*l.* a year which was placed by the Treasury at the disposal of the Board for the establishment of lectureships in forestry has been allocated to the University College of North Wales at Bangor and the Armstrong College at Newcastle-on-Tyne. The results have been most encouraging. A considerable number of students have been found desirous of taking a full collegiate course of study, good classes of practical foresters and others have been conducted at selected local centres, while there has been a constant demand on the part of landowners for expert advice from the lecturer. (4) A school for working woodmen has been established by the Commissioners of Woods and Forests in the Forest of Dean, and is now in the third year of its existence. From eighteen to twenty youths are receiving instruction. (5) Legislation would be necessary to remove the inequality in the levy of the estate duty on timber, and it has not been possible hitherto to take any steps in this direction. The matter has, however, not been lost sight of. (6) The Railway Fires Act, 1905, which comes into force on January 1, 1908, will give some protection to owners of woods against loss by fire caused by sparks from locomotives. (7) Special inquiries were made in 1905 with a view of ascertaining the extent of land now occupied by woods in Great Britain, and the results have been published in the agricultural returns for that year. The three categories suggested by the departmental committee were adopted. (8) With the object of ascertaining the districts in which local authorities have developed the catchment area of their water supplies by afforestation, the Board communicated with the Local Government Boards for England and Scotland, who sent out a circular letter to all local authorities asking for a return. The results were tabulated and published in the Journal of the Board of Agriculture for November, 1904. A leaflet on the relation of woods to domestic water-supply was published in January, 1904, and a large number of copies have been issued. The Board are keeping the various recommendations of the departmental committee steadily in view, and they hope to be able from time to time to proceed further in the directions indicated in their report.

BUILDING IN NEW SOUTH WALES.

IN the report of the Government architect, Mr. W. L. Vernon, for the year 1905, it is recorded that an important addition was made to the work of the branch by the transfer to it of the architect's branch of the Department of Public Instruction engaged in the erection, improvement and repair of school buildings, of which there are upwards of 4,000 throughout the State. This entailed some rearrangement with regard to the *personnel* of the staff thus brought over, and every effort was made to avoid injustice or hardship to these officers. It has resulted, as was anticipated, in a considerable modification of the cost of the preparation of smaller works and the inspection thereon in the country districts, whilst the existing drafting office staff at the head office is available for all metropolitan and the larger class of school works. I have endeavoured from the outset to render efficient and satisfactory services to the Department of Public Instruction, and, as soon as the somewhat different modes of practice are brought into line with those of this department, I have reason to hope a satisfactory result in all respects. Mr. Wigram, the architect in charge, was transferred at the same time, and his intimate knowledge of school work has fortunately been available.

A portion of the branch has been kept fully employed in satisfying the requisitions and instructions of the Department of Home Affairs of the Commonwealth Government. In this case also (as in the schools) my officers and myself have done our utmost to satisfy the instructions, and I am in a position to state that the work carried out is of a satisfactory and substantial character, and at a cost governed by the keenest competition, excepting in the smaller works, which have been entrusted to Mr. King and his experienced staff in the Government architect's yard. The branch has, in agreed upon commission, earned this year 2,465*l.*, which is placed to the credit of the salaries list. Representations were made with the view of reducing, if possible, the unnecessary amplification of small requisitions, and a correspondence has been carried on and interviews held with the inspector-general of works for the Commonwealth, with the view of accomplishing this object. The same difficulties had to be met in dealing with the payment of claims either by contract or day-labour accounts, or for stores issued or goods purchased from merchants, and in this again an endeavour has been made to simplify the procedure.

During the year a special committee was appointed to deal with the safety of theatres and buildings of public resort and with the recommendations of licenses. The Government architect and the principal assistant architect (Mr. McRae) were made members of the committee, and the latter has consequently been much engaged in attending to this special work. It involved the measurement and preparation of plans of all the metropolitan and Newcastle theatres, and special investigation and report upon upwards of 300 buildings of entertainment throughout the State. Considerable negotiation has consequently taken place with the proprietors of these buildings, and a reference to the committee's report will show that the general subject has been sufficiently brought in hand to admit of recommendations with regard to further legislation.

This branch has also undertaken the administration of the recently passed Scaffolding and Lifts Act, and one inspector (Mr. Fildes) was appointed by the Public Service Board to undertake the work, assisted by two officers detailed from the branch, whose services are therefore no longer available in connection with building operations. Under the Act the Government architect is appointed arbitrator, in cases of appeal by owners and contractors, against the requirements of the Act. I have in consequence been called in on various occasions to give a decision with regard to the construction of lifts, but, so far as the compliance with the regulations of scaffolding is concerned, I have the pleasure of stating that there has been little or no necessity for my services.

The inspector of scaffolding and lifts reports as follows :—

"During the year 1,267 notices stating intention to erect

Digitized by Google

scaffolding were received, which means that approximately 6,200 inspections were made. The regulations now in force were not gazetted until January 20, 1905, and prior to this date the inspectors were put to considerable trouble in getting scaffolding erected to standard dimensions, but since the gazettal of the regulations this matter has been greatly facilitated, resulting in no appeals being made, and a marked improvement in the class of scaffolding used throughout the district. There have been recorded nine fatal accidents and twenty casualties on buildings in the twelve months, but no fatality and only one casualty was attributed to defective scaffolding, and in this case the workmen injured erected the scaffolding without the knowledge of the inspectors or the authority of their employers. I must here acknowledge the great assistance which Messrs. Burns & Little have given me in carrying out the inspection of scaffolding. The number given of scaffolding inspections made does not imply but half the work done. The lists regularly received from the Water and Sewage Board and the Sydney and North Sydney Municipal Councils give us the addresses at which building operations are being carried on, and among these there are many scaffoldings and much gear used and inspected for the erection of which it is not compulsory to give notice to the inspector. The number of lifts in commission totals 613, upon which over 1,600 inspections have been made. The majority of these lifts were erected prior to the Act coming into operation, and the greater number, particularly 'goods lifts,' have been erected without that due regard for the protection of life and limb which this class of machinery demands. This fact has necessitated great alterations being made to them, and since January 20, 1905, when the present regulations were gazetted, further precautionary measures of a structural nature are being insisted upon, which cannot help but to greatly minimise the risk of accident which is attendant on these machines. The inspector has had considerable difficulty in impressing upon owners and users of lifts the dangerous nature of these machines, but when pointed out no great difficulty is experienced in insuring compliance with the regulations. The number of notices received for the erection of hydraulic lifts is forty-two; electric lifts, twenty-nine; other power, six—making a total of seventy-seven new lifts. Twelve appeals have been heard and determined, covering thirty-five lifts. Five fatal and several minor lift accidents have occurred, but in each case it was proved to be through the injured one's own carelessness. Eleven steam cranes have been erected, upon several of which additional safety precautions have been insisted upon, and I purpose drafting and submitting regulations governing the construction and use of these machines, 'Alabamas,' and steam hoists for building purposes."

Another change was commenced with respect to the transfer of the lighting of public buildings in the city to the new electric works of the City Council. This has necessarily been a long and costly work, entailing practically new installations in the buildings themselves. Mr. Raw's time has been much occupied with this matter, and it is with regret that I have to refer to the necessary inevitable discharge of the staff of electricians, engineers and firemen from the temporary stations, which will, as soon as possible, be dismantled, and the cost of lighting transferred to the votes of the several departments occupying these buildings.

A further addition was also made to the work of the branch in the retransferring to it of building matters in connection with the lighthouses and pilot stations on the coast from Point Danger to Green Cape. It may be interesting to note that prior to the year 1890 these services were rendered by this branch, and were then transferred to the harbours and rivers branch. I have entrusted the immediate supervision of these works to Mr. Drew, whose thorough knowledge and experience should be an assurance that this highly technical class of work is still in good hands.

On the absorption of the schools' work, before referred to, a most important change was made with regard to the supervision of works in the country districts, with the view of diminishing the cost of country inspection if possible. The assistants to the district architects were withdrawn, the office at Grafton was closed, and its work transferred to that at Armidale, while regulations were formed under which the inspection of works contracted for was entrusted to the various district works officers stationed throughout the State.

The Palais de Justice, Paris, is to be enlarged and the houses required for the purpose are to be obtained without delay.

GENERAL.

An Exhibition of etchings by Mr. Frank Brangwyn is now open at the Salle de l'Art Décoratif, in the rue Laffitte, Paris. It contains about forty examples of the artist's work, including his "Building of the New Museum, South Kensington."

The Lord Provost's committee of Edinburgh Town Council, who have had under consideration the proposed site for a municipal art school, recommend that a portion of the ground now occupied by the cattle market at Lauriston should be granted by the Council as a site for the buildings, and that Mr. Morham, the city architect, be instructed to mark off about 1½ acres in extent with a view to its selection being approved by the Council.

When the Baths and Gymnasium provided by Mr. Andrew Carnegie for Dunfermline, at a cost of 40,000*l.*, were approaching completion, two panels illustrative of the objects of the institution were placed at each side of the main entrance. The Carnegie Dunfermline Trust, however, organised a competition among several senior South Kensington students. The building has now been adorned by new panels in bronze executed under the superintendence of Mr. R. Goulden, A.R.C.A., Chelsea, the successful artist. The subjects represent "The Angel of Purity guiding the Steps of Children" and "Moral Strength repelling Sloth or Evil."

The Edinburgh Dean of Guild Court has granted a warrant for the erection of the drawing classrooms at Heriot's Hospital at the northern boundary of the grounds. The building, which will be of one storey, will be 160 feet long and 33 feet broad.

The Honorary Secretary to the committee of the Manchester War Memorial Fund has received a communication from Mr. Hamo Thornycroft, R.A., the sculptor to whom the commission for the commemorative statue has been entrusted, informing him that the group is finished in plaster and ready for the bronzefounder to cast. Mr. Thornycroft expects that the whole will be ready for fixing in six months' time. He furnishes the following description of the memorial:—"It consists of a group of two soldiers as in the midst of a hand-to-hand fight; one of them down on the ground wounded, resting on one hand, while with the other he hands his last cartridge to his brave and stalwart comrade, who stands above with firmly planted feet and tightly gripped rifle in the action of defence. The figures are larger than life—what is known as 'heroic' size, about 6 feet 8 inches—and are placed on a rocky plinth about 2 feet 6 inches deep, so the whole group is about 9 feet in height. This will be placed on a granite pedestal, which will be enriched with panels inscribed with the names of the men of the Manchester regiments who fell in the late war."

M. Adolphe Thiers, architect, has obtained the prize founded by the late M. Bartholdi for his design in the Salon of a structure at the confluence of two rivers.

The British Archæological Association will hold its annual assembly in Nottingham during the last week of July. This is the first time the Association has paid a visit to Nottingham, and arrangements are being made for a thorough examination of the chief antiquities of the neighbourhood. The president of the Association is Mr. Charles E. Keyser, F.S.A., of Reading.

Mr. Horniman asked the Prime Minister in the House of Commons whether he would consider the advisability of so altering the terms of the appointment of the new director of the National Gallery as to give greater facilities for the rapid acceptance or purchase of pictures, so that donors might not be discouraged by delays and money wasted by the pictures not being bought until after they had been sold by the original owners. Sir H. Campbell-Bannerman in replying said:—The present director of the National Gallery has been appointed on the same terms as his predecessor. The expediency of modifying the status and power of the director is receiving careful consideration.

The Prix Charles Blanc, of the value of 2,400 francs, has been divided this year among M. Gualtier, for his essay on "Le Rire et la Caricature," M. Bréhier for his "Christian Basilicas," and M. Bertrand for his "Versailles."

The Secretary of the Institute of Architects in Ireland denies that the new conditions of contract were adopted without consultation with the Builders' Society.

The Local Government Board have sanctioned a loan by the Essex education committee of 2,143*l.* for the purpose of enlarging the Staples Road Council schools, Loughton.

URALITE IN AFRICA

The Best Fire-Resisting Material for General Building Work.

East London, South Africa.

Messrs. A. C. MAYTHAM & CO., Electrical Engineers, write:

Dear Sirs,—We have to advise that during the recent destructive fire on the premises of Messrs. Rubenstein & Co., adjoining our stores in East London, we had the opportunity of practically testing the fire-resisting qualities of Uralite. During the progress of the fire it was found that our stores were endangered owing to the falling girders and columns displacing part of the existing party wall between the two buildings. These holes we promptly blocked with sheets of Uralite, which resisted the fierce flames in every way, and certainly saved the store from what would otherwise have been certain doom. At the same time sheets of Uralite were placed in the roof lights, the glass of which had been destroyed by the great heat; this alone prevented a catastrophe, and points conclusively to the qualities of this non-combustible fire-resisting material.

(Signed) A. C. MAYTHAM & CO.

Testimonial from J. R. CORDINGLEY, Esq., Contributor of peal of Eight Bells to St. John's Church, Bradford, Yorkshire:—"We think we have one of the finest peals in the country, and one that gives the ringers and ourselves every satisfaction. They are often heard at a distance of four miles."

Design 9×6, as shown above.

The "SANATORIUM" Ventilator,
Or AIR BRICK,

Is a great improvement on the common flimsy louvre Air Brick. The Sanatorium vent has been designed in accordance with the requirements of eminent architects and surveyors, and while admitting a constant abundance of air, it is of artistic appearance, being in a frame, and fitting flush with the building, the rim or flange of the frame neatly covering the joints of the surrounding brick or stone.

The "SANATORIUM" VENTILATOR
Is most effective, strong and durable, being made of superior metal, and having inserted midway between each bar a metal support or protection against the breakage which is so often the defect of the common unsightly louvre, these supports imparting great strength and rendering their durability practically equal to the building itself. It is so constructed with its overlapping bars, that no wet can enter.

Better in Appearance and more Effective than any other Air Brick.

Sizes made, 9×8, 9×6, 9×9, 12×6, 12×9, 10×10.
Galvanised or Painted.

"SANATORIA" VENTILATING CO.,
168 Montague Street, BLACKBURN.

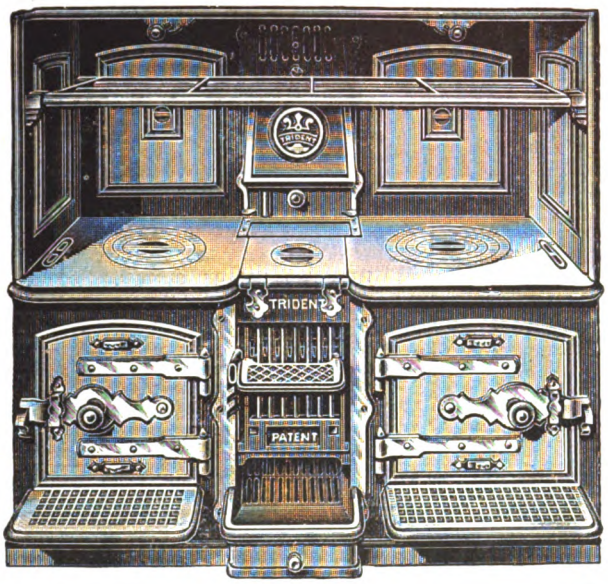
NEW PATENT "TRIDENT" RANGE.

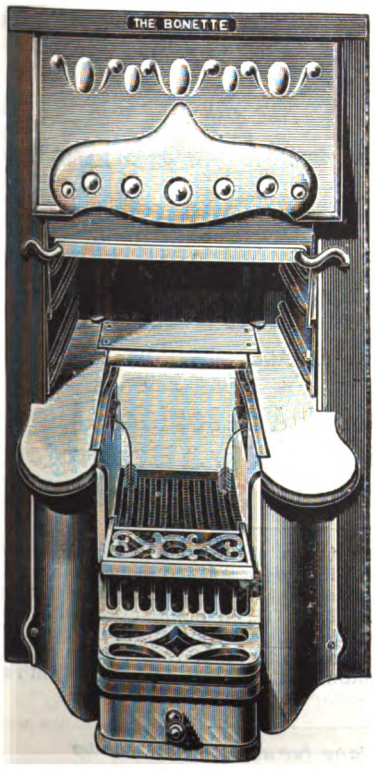


THE BEST AND MOST ECONOMICAL COOKING RANGE YET PRODUCED.

As a COOKER it cannot be beaten.

It BOILS, BAKES and ROASTS to perfection, provides abundant HOT WATER, and is unequalled for ECONOMY.

It provides a cased Flue Range at a moderate price.



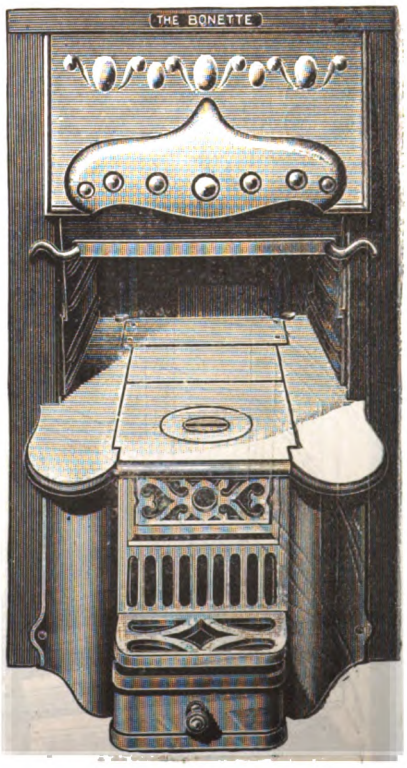
All Flues are easily cleaned, and back Boiler and Pipes are perfectly accessible from the front and easy to get at for repairs, or can be entirely taken out and replaced without disturbing Ovens.

Made in all styles, either with Low or High Ovens, or in combination, and either with Cast-iron Flues, or for fixing in brickwork.

It is easy to fix and simple to use, and full printed instructions are supplied with every Range.

Supplied and kept in Stock by all the Principal Ironmongers in London and the Provinces.

The "BONETTE" Combined Sitting-Room Grate and Cooking Range.



An ideal Stove for Flats, Lock-up Shops, Bungalows, Workrooms, &c.

Requires no brickwork, all Flues formed in Iron.

Makes an OPEN FIRE HOB GRATE as shown on Left, a CLOSE FIRE & HOT PLATE as shown on Right, or by lowering the front door or Curtain makes a PERFECT ROASTING or BAKING OVEN.

Made also with CIRCULATING BACK BOILER.

Write for Catalogue and full Particulars.

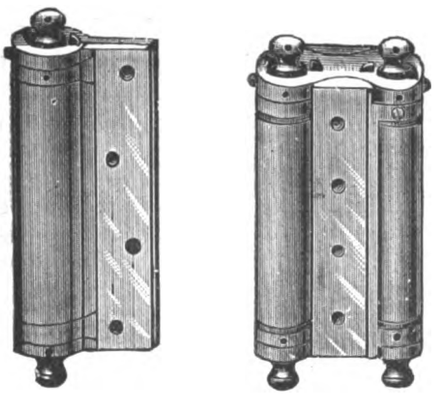
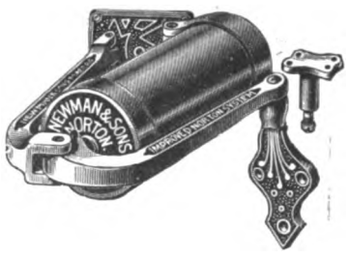
URALITE IN AMERICA

For use in Factories, the best Fire- and Fume-Resisting Material in the World.



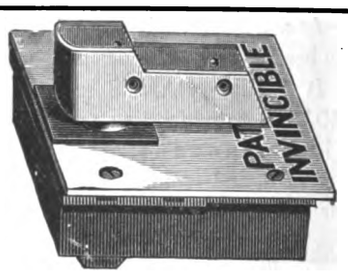
Messrs. JOSEPH BANCROFT & SONS Co., Manufacturers, Bleachers, Dyers and Finishers, Rockford, Wilmington, DELAWARE, write:—

In answer to your enquiry as to the satisfactory results obtained from the use of Uralite, will say that we think from our experience it is the only material which would answer in the places in which we have used it. We have found that acid fumes do not affect it, and that it can be washed down with water without harming it. It also has been through the test of fire without damage, so that we consider it eminently satisfactory.



Your friends respectfully,
(Signed) JOSEPH BANCROFT & SONS CO.

British Uralite Co., Ltd.,



50 CANNON STREET, LONDON, E.C.

NEWMAN'S PATENT REGULATING HELICAL SPRING HINGES,
With Patent Stop to Prevent Overwinding.
The power can be instantly taken off while the Hinges are being fixed and afterwards adjusted to close the Door conveniently. They cannot be overwound.
Made in Brass and Iron, 3, 3½, 4, 4½, 5, 6 and 7 inches

NEWMAN'S NORTON SYSTEM.
MADE IN MALLEABLE IRON.
The Best Door Spring and Check for closing Doors without noise.
Pressure is direct, but diminishes pleasantly as Door is opened.
Also made with Patent Regulator to latch stubborn bolts.

NEWMAN'S PATENT INVINCIBLE,
With and Without Pneumatic Check.
Will hold Door **rigidly to centre,** but diminishes in power as Door is opened, allowing comfortable passage through.
The **Best** Spring to close Door **against wind pressure,** and the most suitable for Banks, Schools, and other public buildings. Made in sizes to suit all Doors.

Made solely by W. NEWMAN & SONS,
DOOR SPRING MAKERS AND BRASSFOUNDERS, **HOSPITAL ST., BIRMINGHAM.**
ESTABLISHED OVER 100 YEARS.

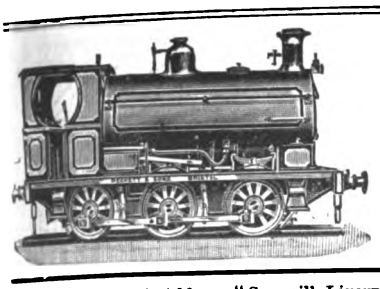
THE LARGEST CONTRACT
FOR
SPIRAL STAIRCASES
EVER PLACED

Has been entrusted to

THE ST. PANCRAS IRONWORK CO., LTD.,

for fixing spiral staircases at ALL STATIONS on the following Tube Railways:—

Baker Street & Waterloo;
Great Northern, Piccadilly & Brompton;
Charing Cross, Euston & Hampstead.



THE new principle upon which these staircases are constructed combines great strength with lightness and economy of material. They are built entirely of steel, and were specially designed by THE ST. PANCRAS IRONWORK CO., LTD., in conjunction with the Engineer of the Underground Electric Railway Company of London, Ltd. Each Staircase is about 18 ft. in diameter, and they vary in height from 50 ft. to 200 ft. The treads and landings are covered with a new and improved non-slipping material.

Full particulars and designs for similar work can be obtained on application to - - -

THE ST. PANCRAS IRONWORK CO., L
171 St. Pan

Importers of all descriptions of Timber. Sawing and Planing Mills at above address. Specifications cut to exact size.

AWARDED SILVER MEDAL, SANITARY INSTITUTE, 1902.

THE BRITISH SANITARY CO.'S
NEW AND IMPROVED SELF-ACTING EARTH CLOSET.

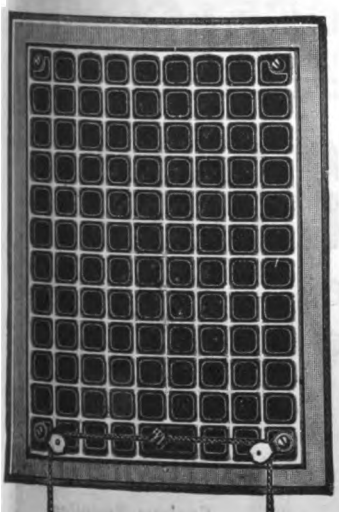
HIGHEST AWARDS:

Birkenhead, 1881; Newcastle-on-Tyne, 1882; Glasgow, 1883; Dublin, 1884; Plymouth, 1885; Edinburgh, 1886; Glasgow, 1887; Haddington, 1892; Liverpool, 1894; Newcastle-on-Tyne, 1896.

For Simplicity and Efficiency their Closet stands alone.

Medal from the Society of Architects, London, for superiority of workmanship and materials used in manufacture of Closets.

ITS ADVANTAGES ARE—



1ST. The simplicity, strength of the mechanism, and non-liability to get out of order. 2ND. It is self-acting. 3RD. The effective distribution of the deodorising material thoroughly covers and absorbs all offensive matter and smells. 4TH. The large capacity of the containing magazine holding the earth or other deodorising material. 5TH. The very moderate price it can be sold at as compared with other closets not even possessing the above advantages.

PRICE LIST AND FULL PARTICULARS SENT ON APPLICATION TO

THE BRITISH SANITARY COMPANY, 341 BATH LANE (at Charing Cross Station), NORTH STREET, GLASGOW.

COOLEY'S PATENT
DOUBLE DOWEL-PINS.
By this system each Block is securely fastened to its neighbour, and by means of the double-grip of each Pin it is absolutely impossible for the Blocks to loosen; hence it can be recommended in all places where the traffic is heavy, such as in Factories, Schools, Public Halls and Sheds, &c.
For **Wood-Paving** purposes this system will considerably increase the life of the road by reason of the formation of a solid mass, which counteracts the destroying effects of *vibration*.

BEST CURE FOR
SMOKY CHIMNEYS.
BY ROYAL WARRANT to HER MAJESTY the LATE QUEEN VICTORIA.
PATRONISED BY THE NOBILITY THROUGHOUT THE KINGDOM.
MILBURN'S PATENT
NOISELESS
REVOLVING CHIMNEY COWL.
NORTHUMBERLAND WORKS, MARLBOROUGH.

THIS is the only Cowl as yet in the market which in ALL cases prevents wind blowing down Chimneys. It is almost impossible to say too much in its praise. Placed in the most trying situations, it has never been known to fail. Great care is used in the construction of its internal fittings, which, being made of Copper and Brass, will last a long time. It is not at all liable to get out of order, and is made so strong that it will stand the force of a hurricane; in fact, increased action of a storm only increases its efficiency. It is perfectly noiseless; is easily swept—the shaft being free from obstruction to the sweep machine—the head cleansing itself; a heavy fall of snow does not impede its action, neither is it affected by frost. In case of the chimney taking fire it would remain uninjured, being made fireproof; and the oil-box requires replenishing with oil only once in six years.

Made in Galvanised Iron, with Copper Fireproof Oil-Box, £3 10s.
DELIVERED FREE to any Railway Station in the United Kingdom.
CAN BE FIXED BY ANY BUILDER.

DOULTON'S Patent Isolated Trough Closet

WITH SYPHONIC ACTION No. 333.

Fitted with Cast-iron Closet Screens Glass Enamelled or coloured Vitreous Enamelled.

For Schools, Barracks, Factories, &c.

In manufacturing this pattern, three or four important points have been borne in mind, viz.:—

The isolation of each person.

A large surface area and depth of water in the basin.

A good flushing rim, by which the whole interior surface is thoroughly cleansed when the cistern discharges.

A tank arrangement that allows a large aftercharge supply.

Doulton's Patent Automatic Regulator for controlling the discharge of flushing tanks in connection with Trough Closets can also be supplied.

AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for new over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods
They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.
N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

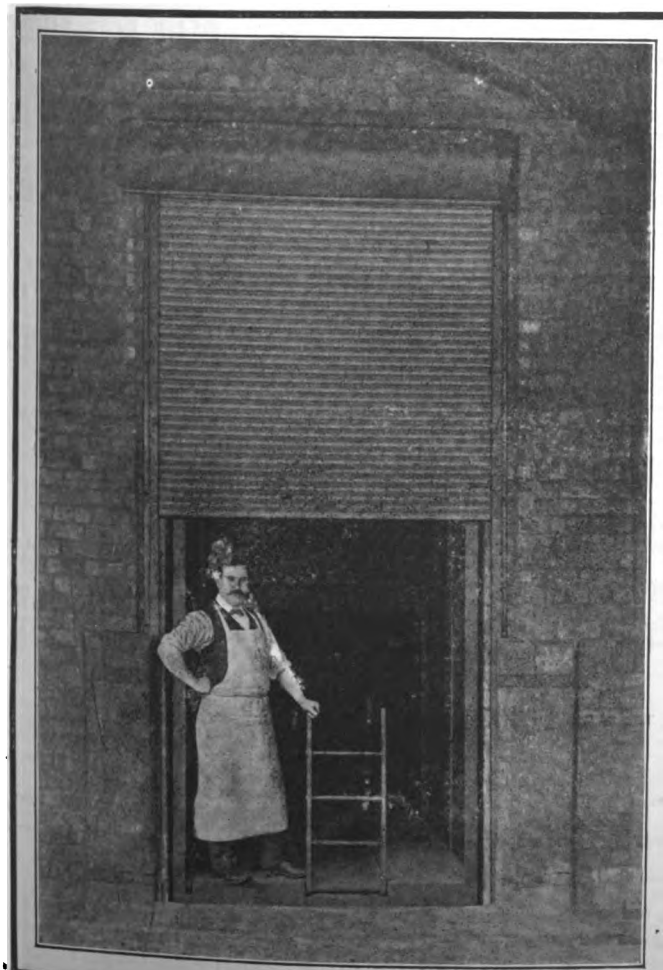
ARCHITECTS AND BUILDERS PLEASE NOTE.

CALL AND SEE THE PATENT "GASCOL" STOVE.

The special attention of all Architects and Builders is called to the "GASCOL" patent stove, which is a self-setting stove, which can be heated by either gas or coal, or both at once, effecting a great saving when a small fire is required for warming purposes.



Some Striking Advantages of the "GASCOL"

The "GASCOL" patent stove is constructed on scientific principles, and is exceedingly economical in use, the Oven, with tap full on, consuming but 10 feet of gas per hour. It is strongly built and the fittings are of the best quality. The change can be made in a moment from coal to gas, or *vice versa*. The Gas Hot Plate is fitted with one Boiling Burner, one Simmering Burner, and one Combination Griller and Boiling Burner, with Rise and Fall Double Deflectors, along with a strong tinned Grill Pan and Grid. The Oven is fitted with two Burners, two Runners, one Grid Shelf, and one Browning Sheet, all of which are detachable, and can be easily removed for cleaning. The Gas Connection can be made either at back or front of the Range. The "GASCOL" is simple in action, automatic in working, and is the ideal cooking stove for villas, flats, &c. It is, moreover, exceedingly moderate in price. All Architects and Builders are requested to call and see the "GASCOL" at any of the leading Wholesale Ironmongers, or it may be seen in operation at the showrooms of

MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED.

This Business, having been ESTABLISHED 40 YEARS, has all the experience that time and thought can give and ingenuity can devise in producing the

Most perfect Earth Closet.

Where used there is no danger of typhoid fever. The Company has obtained

A NEW PATENT, 1905,

For further improvements, making its apparatuses

The Perfection of Earth Closets

Without increase of prices. They have been awarded Cold Medals and other Highest Prizes ever given for Earth Closets.

BEWARE OF INFERIOR AND UNRELIABLE IMITATIONS.

They are also especially suited for buildings and places below the level of drains and outfalls, and also where there is difficulty in obtaining a water supply. Testimonials of their value in these respects can be seen at the Company's Offices. They are well made and finished, in plain and in elegant woods, and can be fitted in any position inside or outside Mansions, Cottages, Schools, Hospitals, and Workshops. They are supplied to Camps, and for use on board ship. They have been supplied to Windsor Castle and Sandringham. Over twelve thousand have been supplied to Departments of H.M. Government. When they are required temporarily the Company will contract for lending a quantity, and will fix them if necessary.

On view at the Company's Address. Descriptive illustrated pamphlets and particulars sent post free.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

COMPETITIONS OPEN.

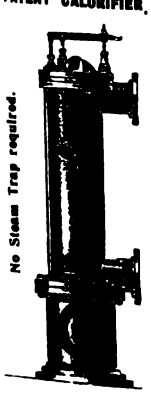
BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

CROMPTON.—Jan. 31.—For a Carnegie free library. Premiums of 30*l.*, 20*l.* and 10*l.* are offered. Deposit 10*s* 6*d.* Instructions from Mr. F. F. Gartside, clerk, Town Hall, Shaw, near Oldham.

LONDON.—Jan. 15.—For a new central public library building in Mare Street, Hackney, to cost not more than 10,000*l.* Premiums of 50 guineas, 30 guineas and 20 guineas respectively will be awarded. Deposit 1*l.* 1*s.* A professional assessor will be appointed. Mr. W. A. Williams, town clerk, Town Hall, Mare Street, Hackney.

WALES.—Jan. 13.—For the erection of a public building (comprising a market hall, public library, refreshment-rooms and stables) on a site at Llanidloes, Montgomeryshire. Mr. W. J. Evans, Llandinam Hall, Llandinam, Montgomeryshire.

WALES.—March 20.—For a free library to be erected in Bangor at a cost not exceeding 3,000*l.*, inclusive of architect's charges. Premiums of 25*l.* and 15*l.* respectively will be paid to the authors of the two approved designs. Premium for successful design to merge into the architect's commission. Deposit 1*l.* 1*s.* Application to Mr. Wm. H. Worrall, clerk to the general purposes committee, Municipal Offices, Bangor, North Wales.



CONTRACTS OPEN.

URALITE in AUSTRALIA
A Great Boon in Tropical Climates.

Brie Brie, Glenthompson.

The cooling properties of Uralite were first brought under notice at Greenvale, where Mrs. Austin has a tank covered in with it, and although this is exposed to a hot sun all day, the water was almost like iced water.

Yours truly,
(Signed) J. H. MURRAY.

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

AN EXPLANATION.—The Luxfer Prism is a flat-backed prism, and is the best for Daylighting dark interiors. The absurdity of any claim to the contrary can easily be demonstrated. Prisms with corrugated backs were patented by the Luxfer Company in 1897, and discarded in favour of a more perfect invention, viz. The Luxfer Prisms, that have been sold in this country during the past six years.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

THE annual statistics in the hematite iron trade show that the industry in the North-west of England has been highly prosperous. The make of hematite iron and speigel amounted in 1905 to 1,345,613 tons, an increase of 265,113 tons on the output of 1904. The stocks at the end of the year, including 51,863 tons held in warrant stores, were 77,565 tons, and the increased consumption during the year was 191,009 tons. Foreign shipments of hematite iron during the year were 47,672 tons, an increase of 13,416 tons against 1904; coastwise shipments were 288,263 tons, an increase of 14,205 tons. Foreign shipments of steel were 134,054 tons, a decrease of 27,021 tons; coastwise shipments reached 335,983 tons, an increase of 78,977 tons, and deliveries of iron locally and export by rail were 981,953 tons, an increase of 163,388 tons. The average number of furnaces in blast during the year was 29½, and the average value of hematite iron was 60*s.* 5½*d.* The price of hematite iron to-day is 72*s.* per ton net f.o.b.

TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent Manchester grates to the Hadlow schools, near Tonbridge.

MESSRS. THOS. PIGGOTT & CO., LTD., of Spring Hill, Birmingham, have just issued a circular relating to the welded pipes manufactured by them, by which they insure perfect welding by a patent process.

ON December 28 a fire broke out at the mill of Messrs. R. J. Wood, Ltd., Broadfield Mill, Heywood, in the roperace, but it was speedily extinguished by the "Titan" sprinklers, which came into operation instantaneously.

MESSRS. S. W. FRANCIS & CO., LTD., have obtained the order from the Crown agents for the Colonies to supply their steel revolving shutters to 105 openings to the Federated Malay States railway sheds.

A VERY pretty almanack comes to hand from the Val de Travers Co., Birmingham. We have also received from Merryweathers, of Greenwich Road, London, an almanack with an illustration of one of their motor fire-engines. Messrs. Shand, Mason & Co. are also issuing an almanack of particular service, as the dates are given, besides 1906, of the years 1905 and 1907, but the value is nullified by printing on thin paper.

IT was stated lately at a meeting of one of the sections of the Architectural Association that the Eureka slates were thinner than Westmoreland green slates and were likely to lose their colour. Thereupon Messrs. Roberts, Adlard & Co., the sole agents for the Eureka slates, wrote to the speaker pointing out that the slates were not as thin as ordinary Welsh slates, and could be supplied as thick as Westmoreland if specially ordered; and, as to colour, they could in certain circumstances give a reasonable guarantee.

WE have received from the Patent Victoria Stone Company their office diary and blotter. This should be of use to architects and builders, as it is of convenient size, and plenty of room is left for each day's engagements. Without in any way being obtrusive, the company have inserted some excellent views of the work carried out by them at various public and private buildings. The illustrations are well reproduced, and contain a few words of explanation of the style and quantity of stone used. This is important information for architect or builder who may be requiring to use the patent stone supplied by this company.

MESSRS. MITCHELLS, ASHWORTH, STANSFIELD & CO., LTD., of Elmwood Mills, Leeds, and 108 Hatton Garden, London, the makers of the patent impregnated felt which is such an important factor where reduction of vibration and sound is required, have received the following valuable testimonial from the Minister of Public Works, Berlin:—"Felt plates under the name of 'Sleeper Protecting Felt' have been placed upon the market, which said plates have stood the tests which they have been subjected to by the Railway Board. The felt plates have been used as lining between base plates and pine sleepers. After lying for a period of seven years the sleepers showed no marks worth mentioning." The firm manufacture three kinds of felt, all of which are durable, resilient and weatherproof. Particulars for adapting will be found in the catalogue issued on application.

BUILDING AND BUILDERS.

THE Walthamstow Urban Council are about to apply to the Local Government Board for sanction to borrow 46,000*l.* to carry out the scheme prepared by the engineer for the treatment of sewage.

DURING alterations at Bocking the workmen who were engaged in pulling down some Jacobean oak panelling came across a large oak stanchion. On the exposed surface is a beautiful arabesque painting of the Tudor period.

A NEW secondary school is to be erected at Braintree at a cost of 9,000*l.* The architect is Mr. Wykeham Chancellor, of Chelmsford, and the contract has been secured by Mr. James McKay, of Clacton-on-Sea. The work is to be commenced early in the new year.

ON the corner of New Street and Waterloo Lane, Chelmsford, new Bank chambers are to be erected; the plans submitted by the executors of the late Mr. C. Pertwee have just been passed by the local authority, the Chelmsford Council.

"MAXIMUM LIGHT GLASS."

LENSES AND PRISMS COMBINED IN ONE SHEET.

ABSOLUTELY THE BEST FOR DAY-LIGHTING DARK INTERIORS.

Increases the Daylight from 5 to 20 times.

By reason of a lens surface running vertically on the outside and at right angles to an interior prismatic surface, this glass possesses a double refractory power.

All the light from the sky is gathered, projected, and completely diffused.

The use of the "Maximum Light Glass" lessens the cost of artificial lighting.

Supplied in ordinary window-glass sizes.

Also in ornamental designs in lead or copper.

VARIETIES.

THE Fairfield Council have just appointed Mr. Farr, of Rugby, as surveyor.

TWO new libraries are about to be erected at Ilford, the central library, at a cost of 6,000*l.*, and a branch library, at a cost of 4,000*l.*, at Seven Kings.

THE roadway in the vicinity of Stratford Court-house, at an estimated cost of 300*l.* to 350*l.*, is to be paved with wood blocks, the work to be carried out by the Town Council.

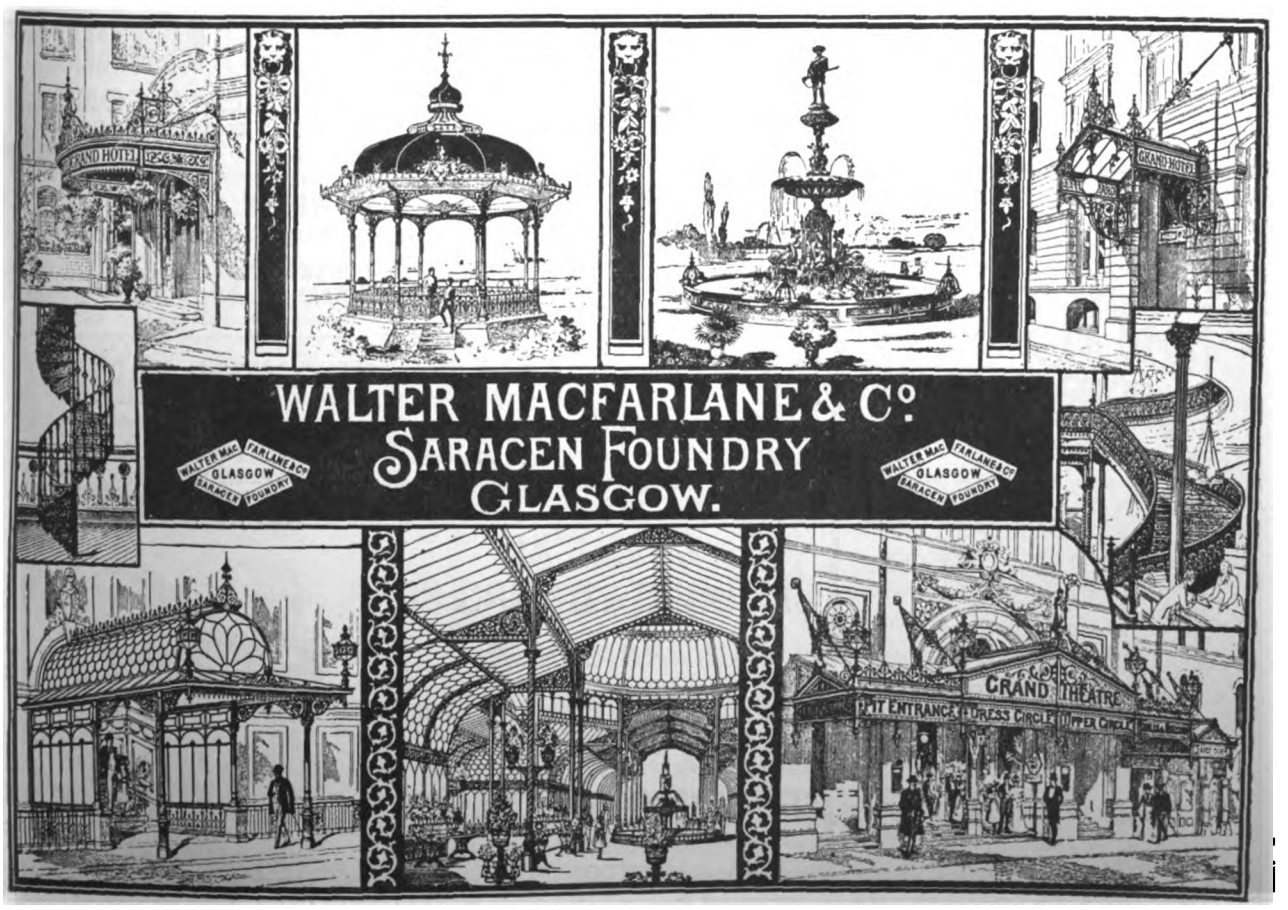
MESSRS. JOHN AIRD & Co. have received from the Egyptian Government the contract for the erection of a further barrage of the Nile at Esneh. The amount is stated to be more than a million sterling.

THE *Sketch* for December 27 contains a laudatory notice of our contemporary the *Illustrated London News*, undoubtedly the leading illustrated journal of the world. May it continue to hold that proud position. Although other journals come and stay, and many others "come and go," may the *News* "go on for ever."

MR. ANDREW CARNEGIE has provided baths and gymnasium to Dunfermline. The original estimate of the cost was 20,000*l.* Afterwards he approved of alterations, which brought the estimated cost to 35,000*l.* After all accounts have been settled it is found that the total expenditure was 43,000*l.* Mr. Carnegie has increased his donation to that amount.

THE Shrewsbury Town Council on Monday decided to apply to Parliament for an Act to confer further powers on the Corporation with reference to the water-supply of the town. The Council having resolved to purchase the gathering grounds at a cost of about 30,000*l.*, the total estimated expenditure on the scheme will approximate 178,000*l.*

MR. ROBERT M'ALPINE, Greenock, head of the firm of Robert M'Alpine & Sons, railway contractors, is about to commence the erection of twenty-five tenements in the east end of Greenock. The entire scheme provides for the erection of forty-five tenements representing 360 dwelling-houses. It is Mr. M'Alpine's intention to reserve about an acre of ground as a recreation-ground for the use of the tenants.



THE London County Council highways committee are going to adhere to the contract to lay the tramway track at Lambeth and Battersea with Aberdeen granite setts in preference to Norwegian setts, as recommended by the Councils of these places. The contract for the Aberdeen setts is in the hands of Messrs. Whyte & Co., who laid the tracks for the Aberdeen Suburban Company.

THE American Consul for Edinburgh and Leith in his report to his Government for 1905 says "that from every point of view—financial, industrial and commercial—Scotland's position at this time is considerably stronger than it was a year ago, and there is ample basis for the opinion expressed by leading men of affairs that 1906 will bring still better conditions."

THE Admiralty have for some weeks past been carrying out boring operations at St. Margaret's Hope with a view to ascertaining data for foundations for the naval base at Rosyth. Already a large bed of mud and other material has been pierced without solid strata being reached. It is reported that the borers have gone to a depth of about 40 feet without striking a satisfactory bed.

THE mayors of Douglas, Morecambe, Llandudno and Blackpool have organised a conference in the Manchester town hall on the 6th inst. to discuss the question of the overcrowding of the various seaside resorts named in the second and third weeks in August. They think it is very desirable that the congestion which has hitherto prevailed on account of the very large number of holidays in these two weeks should be obviated by spreading the several holidays over a longer period.

A RECENT congress of scientists and workmen held in the Trocadéro at Paris to consider the evil of lead-poisoning among painters approved of a Bill the chief provision of which is entirely to prohibit the manufacture of white lead. The 2,000 delegates declared that only the prohibition of the use of white lead would remove the diseases arising in connection therewith. The measure has the almost unanimous support of the members of the Chamber, who, however, have secured the insertion of a provision giving the manufacturers four years from the date of enactment in which either to close their works or convert them into factories for the production of material having a non-poisonous basis.

MR. W. D. CAROE, the Master, at the quarterly meeting of the Plumbers' Company held at the Guildhall on Monday, admitted the following operative plumbers to the freedom on having passed the company's examinations in the technology of plumbing and workmanship in the honours grade. Their ages range from twenty-two to thirty-two :—Frederick George England, R.P., of Sunderland; Frederick James Fearns, of Manchester; Alexander Forbes, R.P., of Aberdeen; William Morris, R.P., of Southport; Hargreaves Riley, R.P., of Accrington; Joseph Tolmaer, R.P., of Blackpool; Edwin J. H. Upham, of Cardiff.

THE Lambeth Borough Council have decided that the following clauses shall be inserted in the tenders for the coming year :—The contractors shall exhibit in a prominent position in their offices, premises or works, and at any offices, premises or works of the Council, where the contract is being executed, or where the men employed in and about the execution of the contract have access, a printed notice, to be supplied by the Council, defining the rates of wages and the conditions of labour which the contractors, in pursuance of the conditions of their contract with the Council, are compelled respectively to pay and observe. The borough engineer, or other officer of the Council, under whose control the contract is being executed, shall have the right regularly to inspect and examine the contractors' time sheets and wages sheets.

ELECTRIC NOTES.

THE electric-lighting committee of the Portsmouth Town Council has decided that the whole of the tram routes in the borough shall be illuminated by 1,000 candle-power electric arc lamps. Altogether 126 lamps will be required.

HIS Majesty's Consul at Trieste has reported to the Foreign Office that, owing to the continuous increase in the price of raw material, the Austro-Hungarian manufacturers—following the example of their German colleagues—have augmented by 10 per cent. the price of electrical materials and electrical machinery.

THE Dolter Electric Traction Co., Ltd., have completed arrangements with the National Electric Construction Company to instal the Dolter system at Mexborough, where some six miles of track had already been equipped. The entire length between Mexborough and Swinton will be ten miles, and it joins the Sheffield system at Rotherham. The trams are propelled on the principle of surface contact. The system consists of a long iron skate or runner, so suspended from the under part of the car that it just touches the surface of a number of iron blocks embedded in the road, each of which forms the upper part of a water-tight contact box, a chamber in which is suspended a ball-crank lever. The system is in operation in Paris, Dresden and other places on the Continent.

PRESERVATION OF BUILDING MATERIALS.

IF the old builders used materials in excess they were not altogether to blame, for they had no other way of resisting the decaying operations of nature. In modern times economy has to be practised, and the dimensions of all parts of a building are reduced to a minimum. It was to counteract economy which became parsimony that by-laws were enacted in this country. In order to cope with the organic and inorganic influences to which timber was subjected, chemists invented some kinds of remedies. Creosoting, which was invented by John Bethell, who, like Lord Armstrong, was a solicitor, found more favour than kyanising or burnetising, &c. We can see its use on nearly every railway in blackened sleepers. It is necessary with the process to drive the creosote through the fibres of the wood, and as that is only possible from the ends of a plank or beam, force is required. The result is that creosoting is only practicable when a large quantity of timber has to be prepared. And in consequence it is rarely applied to timber which is used in building. The appearance of timber after it has been operated on is not satisfactory. "Anthrol," which is fortunately a British, and not a foreign invention, and is made in Glasgow, can for timber to be used in buildings or engineering works on a small scale serve the same purposes as creosote. It is fluid, and can be applied by means of a brush or by immersing timber in a bath of "Anthrol." The appearance suggests the application of a light brown stain. It will no less serve as a

preservative of stone and brickwork, for it has a sterilising power which appears to be fatal to all agents of decay. Stone or brick will be darkened, no doubt, but only temporarily. "Anthrol" has other uses, but as a preservative of building materials it becomes a desirable addition for all varieties of construction.

HEAT ECONOMY IN FACTORIES.

AT the ordinary meeting of the Institution of Civil Engineers on Tuesday, December 19, Sir Alexander Binnie, president, in the chair, the paper read was "Heat Economy in Factories," by H. A. Mavor, M.Inst.C.E. The following is an abstract of the paper:—

In an investigation undertaken in 1898 on the comparative costs of power in factories in the United Kingdom, the author found great difficulty in obtaining accurate data, owing in many cases to the fact that the fuel consumed was applied for heating as well as for power. This circumstance appeared to offer inducements for further examination of the question, and the paper is an account of a method of inquiry which has resulted in a simplification of the problem and in the acquisition of useful results. The method consists in dealing with the heat-production and distribution by a system of double-entry accounts, in which the boilers are debited with the heat represented by the coal and credited with the heat represented by the steam. These credits are carried to the debit of accounts dealing with the various uses to which the steam is put in the factories. These accounts, again, are credited with the work performed, the balances being carried to a balancing account, which brings out the efficiency of the prime movers and separates out the useful work and the losses in such form that the losses can be divided into necessary and avoidable losses, the whole giving a comprehensive view of the conditions of efficiency in terms of British thermal units.

Six specimen balance sheets are given in the paper, and the accounts are shown in detail, the cases chosen being:—

(*a*) A factory in which there is a small amount of heating and a number of steam-engines.

(*b*) A factory where the power is obtained from one large engine and the heating occupies a prominent place.

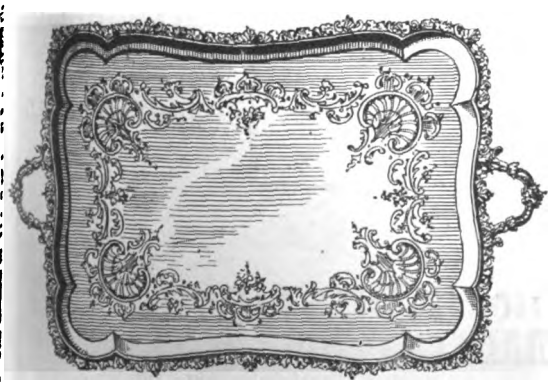
(*c*) A similar factory where there are many engines and a scattered and complicated heating system.

(*d*) A factory where there are a number of engines of various sizes and a considerable amount of heating and boiling.

(*e*) A factory similar to (*d*).

(*f*) A blast-furnace plant.

The balancing accounts in each case are discussed in detail and indications are given of the methods of arriving at the results, showing the bearing which the ascertained efficiencies have upon existing methods of working and proposed modifications thereof.



BUILDING AT WORTHING.

THE agenda for the Worthing Town Council meeting, says the *Sussex Daily News*, contains abundant proof of the continuous growth and prosperity of the town. Plans have received the approval of the works committee for the erection of nearly fifty new houses, and almost as large a number was passed last month. Several large estates have recently been opened up and building is brisk. Another report which speaks of progress relates to the making up of new roads and of the execution of private street works, the streets concerned including Chaucer, Cowper, Farncombe, St. Valerie and Boundary roads, Elm Grove and Heene Terrace. The "making up" of Eton and Harrow roads has just been completed. The majority of the thoroughfares named are lined from end to end with houses of recent construction. The Corporation have also undertaken improvement schemes which must tend to enhance the attractiveness of the borough. The work of roofing in the open-air bath, which will provide a much larger and more convenient swimming bath than has hitherto existed in Heene Road, is reported to be proceeding satisfactorily. Further progress in the extension of the Marine Parade westwards will shortly be made, as tenders are to be invited for the erection of standards and rails for the newer part of the esplanade between Heene and Seaview roads, which is part of the scheme.

AUSTRALIAN COMMERCIAL ARCHITECTURE.

DURING the last twenty or thirty years what may be designated as commercial architecture has made great progress in the Australian Commonwealth, especially in Sydney and Melbourne, in both of which cities the numerous palatial buildings occupied for mercantile, banking and other business purposes form a strange and instructive contrast to that with which commercial people of an earlier generation were familiar, and not the least interesting fact connected with the new order of things consists in its representing, in the majority of instances, the steady development and expansion of old-established business firms, not a few dating back previous to the period of gold discovery.

Springing from small beginnings over forty years ago, the firm of Messrs. Anthony Hordern & Sons has become the largest general store in the southern hemisphere, the continued expansion of its business operations necessitating the construction of the most extensive premises of their kind, at a cost of over 300,000*l*. Mr. Samuel Hordern, who is now the sole proprietor of the business, made a trip some two years ago through Europe and America, with a view of studying the best examples of commercial architecture, and on his return to Sydney he entrusted his architect with the task of preparing the plans for the new building, to make way for which eighty shops and other structures had to be demolished, the area to be covered embracing about three acres of valuable ground in the heart of the city. About 500 men were employed in the work of excavating the foundations to a depth of from 15 feet to 20 feet, and early in 1904 the great walls commenced to rise. In these and the foundations 10,000,000 bricks have been used—sufficient, if placed end to end, to form a line from Sydney to New Zealand or from Brisbane to Adelaide, a seven weeks' journey for a man walking 30 miles a day. The lengths of hardwood for joists and of kauri pine for flooring represented a mile of timber for every day in the year. One thousand iron columns, 50,000 bags of cement and 8,000 sheets of corrugated-iron were required and used. The 1,430 lighting windows and the 35 large show windows necessitated the use of an acre of glass.

In connection with the new building, Mr. Hordern gave imperative directions that the building should be as thoroughly Australian as was possible. Everything that could be so supplied was of local material, and much of it was prepared in the firm's own workshops. Australian enterprise had made the building necessary, Australian money was erecting it, Australian brains were to guide its future destinies. The work of construction was carried out by the day labour system, under the supervision of the firm's own building and factory managers. That Australian materials were used wherever possible meant that they were used nearly everywhere. Such items as the ornamental ceilings and panelling, fittings, show-cases, joinery and much of the decorative work all came from the firm's factories and workshops.

In its completed form the building is stated to be the largest commercial structure of one standard of architecture extant. The main frontage is 455 feet, one of the end frontages 228 feet and the other end frontage 250 feet. The lower three floors, representing a space of 9 acres, are open for general business. The two upper floors, of 6 acres, are for reserve stock and other purposes. Just as the many separate departments on the shopping floors are arranged upon a plan of perfect order and simplicity, so also are the reserved stock floors, which are divided by passage-ways into squares and the squares into store-rooms, the door of each of which bears the name of the department or branch to which it forms an adjunct.

In addition to luxurious accommodation for customers in the form of lavatories and retiring-rooms, there are a large fountain and confectionery counter at one end of the dress department, and a refreshment-room capable of seating at once from 300 to 350 persons, all at small and widely separated tables, all the marble employed being made at the works of the firm. A remarkable system of pneumatic cash tubes, the largest the Lamson Store Service Company has ever put up, has been installed in the building. The main cash receiving-hall has hundreds of large polished, bright metal tubes, forming an organ-like dome overhead, and from these tubes the cash cartridges drop with a continuous rattle, like shells into a beleaguered fortress, while sixteen cashiers, each working at his own till, are kept constantly busy in receiving cash and counting out change.

URALITE
FOR
Theatres, Music Halls, &c.

Messrs. SMITH BROS., Gas, Electrical, Sanitary and Water Engineers, 91 Brooke Road, Stoke Newington.
November 11th, 1905.

Messrs. THE BRITISH URALITE CO., LTD., London.

Dear Sirs,—Regarding the "Uralite" supplied by you, this was fixed on a ceiling in a first-class London ball-room, with most satisfactory results, besides giving peace of mind to the owner, who knows that even great vibration will not cause large patches to fall (as with plaster), endangering his patrons, who may be dancing beneath it. It also makes the roof practically fireproof and vermin-proof.

Yours faithfully,
(Signed) SMITH BROS.

THE BRITISH URALITE CO., LTD.,
50 CANNON ST., LONDON, E.C.

frontage, is 500 feet long, and is said to be the longest of its kind ever installed anywhere. The pneumatic power for one of the end blocks is supplied by two sixty-five horse-power electric motors, driving powerful "Roots" blowers—colossal cylinders enclosing fans that accomplish seventy-eight revolutions per minute, and propel 110 cubic feet of air at each revolution. There is a similar plant, but of rather less power, for the other end blocks. The twenty-one lifts are supplied by hydraulic power, and the entire building is illuminated by gas and electricity. There is also a telephone switchboard with eighty-one lines, and, in addition, an extensive inter-departmental service.

Warned by the experience of the great conflagration which some time previously destroyed the huge building in which the firm's business was formerly conducted, most complete provision has been made throughout the establishment for the prevention of fires. There are sixty-six fire-stations fitted with the most modern appliances and convenient fire-escapes of the most modern pattern within easy reach of every point in the building. Further, Grinnell sprinklers, with altogether ten miles of service pipes, are fixed on every floor, as well as automatic fire-alarms. The main stairways are of steel, and the lift-wells can be cut off so as to prevent them from feeding flames by acting as air-draughts. The fact that customers do not go to the two top floors is an additional safety measure.

THE BIRMINGHAM BUILDERS' EXCHANGE.

THE Builders and Birmingham Trades' Exchange and Exhibition may now be considered as an established institution. The Midland city is so often looked up to as a precursor of revolutions in business, it is not unwarranted to believe that similar Exchanges will be arranged according to the Birmingham system. One reason for its success is the character of the advisory council. The president is Mr. William Sapcote, who is an ex-president of the Midland Centre National Federation of Building Trades' Employers. Among the vice-presidents are Messrs. Andrews, Doubleday and Hale, architects; Colonel Barnsley, the president of the Birmingham Master Builders' Association; the Professor of Hygiene in the University; Dr. Edwards, a medical scientist; and Mr. Titterton, a member of the Corporation. The Council consists of three contractors, an electrical engineer, an accountant, a patent agent and an exhibition manager. The general manager and secretary is Mr. W. J. Spurrier. The best evidence which can be afforded of the satisfactory character of the Exchange will be found in the list of firms represented in the building. Among them are:—Doulton & Co. Ltd., Maw & Co. Ltd., Minton, Hollins & Co., Twyfords Ltd., Geo. Farmiloe & Sons, Ltd., Bath Stone Firms Ltd., Mackey & Davies, Christie Patent Stone Co., Empire Stone Co., Lyne & Son, Panicali Bros., Gibbs Bros., Hamblet's Blue Brick Co. Ltd., Haunchwood Brick and Tile Co. Ltd., G. W. Lewis Tileries, Ltd., W. E. Partridge & Co., Peter Wood, Ltd., Gibbs & Canning, Ltd., Geo. Skey & Co. Ltd., Yarrow & Co. (Bolton) Ltd., Blackwell Bros., English Bros. Ltd., E. Cotterill & Co., Phillips & Son, George Price, Ltd., Wm. Harland & Son, Arthur Holden & Sons, Ltd., Dunmore, Ltd., Kaye & Co. Ltd., Saxon Portland Cement Co. Ltd., Crompton & Co. Ltd., John Gibbs & Son, the Cloisonné Glass Co., Wm. Pearce, Ltd., the Fire-Resisting Corporation, Ltd., the Wood Carving Co. Ltd., the Van Kannel Revolving Door Co. Ltd., Bartlett, Scott & Co. Ltd., Kenrick & Jefferson Ltd. and many others.

What must surprise many people is that such an institute was not established several years ago in Birmingham. In no part of England is time more valued, and the best way of doing business with any manufacturer in the city is to have a very definite idea of one's own requirements and be able to state them shortly and clearly. Many men, however, require before concluding business to put on, as it were, a considering cap and to go through a whole course of pros and cons on the subject. That may be a safe course, but it is not approved in Birmingham. For such excellent people the Builders' Exchange affords an excellent opportunity for study. They are likely to meet with samples of whatever they desire, and they can take their time in studying all the qualities which an object presents. The Exchange therefore saves both time and temper, and as it is a body for facilitating business rather than for obtaining profit, it is the duty of the officials to be impartial. In that way we can understand the success of the Exchange.

Are you interested in WOOD PRESERVATION?

Apply to the **ANTHROL** Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of **ANTHROL** and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The ANTHROL COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON.

Architect and Contract Reporter.

FRIDAY, JANUARY 12, 1906.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 Imperial Buildings, Ludgate Circus, London, England.

*** *Entered in the United States of America as second-class matter. Agents for America, The International News Co., 5 Bream's Buildings, Chancery Lane, London, England, and New York.*

Important Notice to the

Architects and Civil Engineers of Westminster.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Ltd., to establish Branch Offices in that district at 43 OLD QUEEN STREET, S.W., *Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.*

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

The Birmingham Offices are at 102 COLMORE ROW.

AGENTS FOR THE COLONIES.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

CROMPTON.—Jan. 31.—For a Carnegie free library. Premiums of 30*l.*, 20*l.* and 10*l.* are offered. Deposit 10*s.* 6*d.* Instructions from Mr. F. F. Gartside, clerk, Town Hall, Shaw, near Oldham.

LONDON.—Jan. 15.—For a new central public library building in Mare Street, Hackney, to cost not more than 10,000*l.* Premiums of 50 guineas, 30 guineas and 20 guineas respectively will be awarded. Deposit 1*l.* 1*s.* A professional assessor will be appointed. Mr. W. A. Williams, town clerk, Town Hall, Mare Street, Hackney.

WALES.—Jan. 13.—For the erection of a public building (comprising a market hall, public library, refreshment-rooms and stables) on a site at Llanidloes, Montgomeryshire. Mr. W. J. Evans, Llandinam Hall, Llandinam, Montgomeryshire.

WALES.—March 20.—For a free library to be erected in Bangor at a cost not exceeding 3,000*l.*, inclusive of architect's charges. Premiums of 25*l.* and 15*l.* respectively will be paid to the authors of the two approved designs. Premium for successful design to merge into the architect's commission. Deposit 1*l.* 1*s.* Application to Mr. Wm. H. Worrall, clerk to the general purposes committee, Municipal Offices, Bangor, North Wales.

CONTRACTS OPEN.

THE calendar issued by Messrs. Samuel Elliott & Sons, Ltd., of Caversham, has the advantage of great legibility, and dates can be seen in the darkest offices. At the head is a view of the doors of the Westminster Cathedral, of which the firm have reason to be proud.

THE General Election is to shortly commence, and it is not in the province of this Journal to take up either side, but the gentleman who spoke at a meeting at Grays, one of the centres of the cement trade in this country, must have been a bold man when he argued against a protective tariff. There are many British industries suffering from the unfair competition of the foreign made article. Cement and joinery are possibly two of the principal. Once compel the speculating builder to use home materials and you have possibly driven one more nail in the coffin of jerry-building. The manufacturers of this country make and supply frequently cheap and nasty goods, but the foreigner can undoubtedly beat them at all points in this direction.

TUBES AND FITTINGS

WAPLER'S VENETIAN BLINDS
Are fitted with a very simple and effective Check Action. (OWN PATENT.)
Are very light and elegant in consequence of the laths being extra thin. Are as easily worked and taken down as ordinary roller blinds.
There is nothing to get out of order. The wear on tapes and cords reduced to a minimum.
For all our Venetian Blinds we use only the very best selected Pine.

TRADE NOTES.

THE names of Messrs. Robert Blackwell & Co., Ltd. are associated with the excellent "Ruberoid" roofing. They have another product which may be considered as supplementary to the ruberoid, called giant waterproof sheeting for the securing of walls against damp. This material is manufactured from the best Manilla stock, impregnated and coated on either side with a water and acid-proof compound which renders it absolutely waterproof, air-tight and odourless. It is applied to the wall by means of an adhesive

Digitized by Google

solution which they supply, and the cost of material and applying is very small. In colour the new material is black and glazed on both sides. It is tough, odourless, and water will not pass through it. It is no thicker than ordinary room paper, and undoubtedly offers security against dampness, which can be applied without trouble.

IT has been often said that hospitals should be destroyed after a very few years of use, for in no other way can dangerous germs be extirpated. Many of the evils can, however, be removed by the employment of the "Horsfall" destructor, which has been supplied among others to the Metropolitan Asylums Board, Corporation of Glasgow, Cheshire County Council, Dublin County Council, Blaby and Wigston Joint Hospital Board, University College Hospital, London; Cape Town Municipality, Radcliffe Infirmary, Johannesburg Municipality, &c. The destructor for the Radcliffe Infirmary, Oxford, was supplied to replace one of another make which was not giving satisfaction. The secretary of the infirmary says of the new destructor that "it does its work thoroughly, and is more than adequate to our requirements, while our coal bill is considerably less." There are suitable destructors for consumptive sanatoria.

NEW CATALOGUES.

THERE is no simpler mode of obtaining power than by utilising elasticity in the form of a spring. With such a material as indiarubber a mere band suffices, but with steel it is necessary in most cases to adopt some kind of spiral. Yet the recognition of elasticity as a power is comparatively modern. It was one of the discoveries of James Bernouille in the seventeenth century, and he was so proud of it he ordered a spiral to be engraved on his tombstone, with the inscription "Eadem mutata resurgo." The controversy between Huygens and Hook about watch springs shows that the principle was not immediately adopted. All the purposes for which the spring is adapted have not been exhausted. Messrs. Terry & Sons announce that they have made thousands of different patterns, and the groups in their catalogue are evidence of an incredible multiplicity of variations of the spiral. They say that "the true art of spring-making cannot be acquired in a day or a year. We have had half a century of practical experience, and can give every satisfaction." Springs are the specialty of the firm, and the plates suggest the advantages of a concentration of skill. Producers of Messrs. Terry's class should be encouraged, for they supply aids which are valuable in many species of manufacture.

THE catalogue of the electric lifts of Messrs. Turner, Atherton & Co., Ltd., a firm established in 1860, is interesting from the testimonials which are reproduced. One company express regret that they did not adopt the Turner electric lifts at an earlier time. Another testimony says the cost of the current is not half the amount which was expected. In another thanks are expressed for attention given to small details which were outside the contract. In a printing establishment where the lifts are used for carrying formes of type to the machine, not a single mishap has occurred. Another firm state that during the two or three years since the lift has been in use there was no necessity for any expenditure on repairs. The collection forms a tribute of which Messrs. Turner, Atherton & Co. have reason to be proud.

BUILDING AND BUILDERS.

TENDERS are to be invited by the surveyor, Mr. Hill-Willis, Tilbury, for a new mortuary.

NEW sewerage works are to be carried out by the Grays Urban District Council, at a cost of 4,400*l.*, at Chadwell and Little Thurrock.

THE Romford (Essex) school accommodation committee have asked Messrs. Aylott, of Chadwell Heath, Messrs. Harrington & Ley, of Romford, and Mr. Kennedy, of Romford, to submit drawings and plans for a new school to accommodate 300 children, and for alterations and additions to the present Chadwell Heath infants' schools.

THE new county lunatic asylum for Essex, which is about to be erected under the supervision of the county architect, Mr. Frank Whitmore, of Chelmsford, will, it is estimated, cost upwards of 400,000*l.* The cost of fencing in the ground is 1,587*l.* 6*s.* The contract has been awarded to Mr. C. E. White, of Basingstoke.

ELECTRIC NOTES.

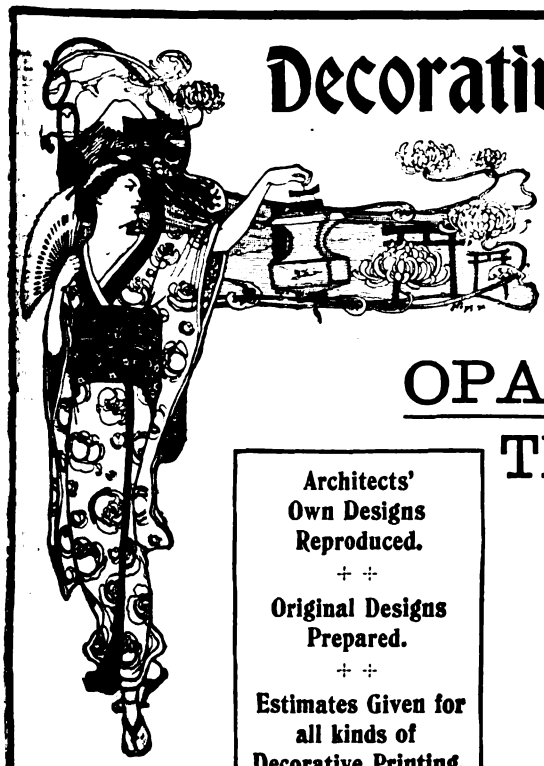
THE Sunderland Corporation have rejected an offer by the Electrical Supply Company to take over the Corporation's two power stations and pay a yearly rental of 12,000*l.*

THE Workington Town Council will commission an electrical engineer to prepare a scheme, with estimate of cost, of electric lighting.

THE electricity committee of the Walsall Town Council recommend that new works should be carried out at a cost of 13,000*l.* to meet the increasing demand for current. The undertaking is at present being run at a loss.

THE Admiralty have decided to go on with the installation of electric light and the erection of a power station in Sheerness Dockyard. The work was stopped a few months since, but is now to be pressed forward without delay.

THE Rochdale section of the Heywood Corporation tramways, which couples up virtually the whole of the electric tramways system in Lancashire, has been inspected by the Board of Trade. It will now be possible to make a journey by tram from Rochdale to Liverpool, and by the construction of a track in the Todmorden district through connection between Halifax and Liverpool will be obtained.



THE law and parliamentary committee of the Holborn Borough Council has reported adversely to the County Council's Electric Supply Bill. Having regard to past experience in connection with County Council undertakings, the opinion is expressed that it is not a suitable body to enter into an undertaking of this nature, more especially as the proposals are to be pressed forward in opposition to the recommendations of its own finance committee. It is, therefore, recommended that a petition should be presented to Parliament against the Bill.

THE Manchester City Council have arrived at a settlement of a long-standing dispute between Mr. Barlow and the electricity committee. Mr. Barlow claimed damages for injury to a warehouse of his by the vibration set up at the electricity works. An action has been pending for a considerable period, but it is now settled. The Corporation undertake to pay Mr. Barlow's costs, allow him 1,000*l.* as damages, and purchase the warehouse at a price to be fixed by arbitration, the value of the property to be taken as it was in March, 1899, with the customary allowance for compulsory sale.

THE public works committee of the Aston Town Council in a report complimented Mr. G. Trentham on the speedy completion of his contract in Birchfield Road and Witton Road, and especially on having the junction at Six Ways laid four weeks after receiving the castings from Messrs. Hadfield's works. The committee are of opinion that it is inexpedient to proceed with the reconstruction and electrification of that part of the tramways in Wheeler Street within the borough of Aston until the city of Birmingham are prepared to reconstruct and electrify that portion of the tramways in the same street within the city.

THE Lancashire Electric Power Company have lodged a Bill at the Private Bill Office to enlarge their powers. When the original Act of the company was passed it was agreed by the promoters that they should not enter any district of any local authority without its consent. In the new Bill the Lancashire company desires to obtain exemption from the clause in question, and desires to be able to supply electricity to lighting authorities and to persons requiring a supply for power, controlled only by a provision preventing them from supplying light except to authorised distributors and interfering with the supply of electricity to light railways, tramways, &c., without the consent of such distributors except the consent be unreasonably withheld, when the Board of Trade shall decide between the parties. There are a number of other provisions, including the authorisation of overhead wires.

IN addition to the loan of 1,212,000*l.* advanced by the London County Council to the Marylebone Borough Council to pay the amount of the award in respect of the purchase of the Metropolitan Electric Supply Company's local undertaking, a further loan of 433,800*l.* was sanctioned to defray the cost of the new electricity generating station in Richmond Street and Lisson Grove, now approaching completion. Of this, 340,405*l.*, repayable with interest in forty-two years, has now been advanced. The Borough Council has still borrowing powers for 48,545*l.* for alterations of works and mains, repayable in thirty-eight years, and 44,850*l.* for meters or alterations to meters, repayable in ten years. The finance committee report that it will soon be necessary to ask for the advance of these sums.

Digitized by Google

A NEW system of electric tramways has been installed. Mr. Trotter, Board of Trade inspector, in his report gives some interesting particulars of the system as under:—"Contact studs are placed in the roadway at intervals of 9 feet, and are flush with the roadway. A chain, of which each link is held up by springs, is fastened below the car. Magnets are fastened below the car, and these cause part of the chain above a contact stud to be attracted down to the stud and cause a contact-maker which forms part of the stud to be depressed on to a galvanised steel cable carried in a pipe below the road. The chain is 10 feet 6 inches long and makes contact with at least two studs. When the car moves forward the chain leaves a stud, and the movable contact within the stud is drawn up by a spring. These springs are of steel, heavily coppered. A safety device is attached to the gate of each of the life guards at a distance of about 7 feet from the chain which collects the current from the studs. If a stud is left alive the effect of the safety device making contact with it is to open the main circuit breaker on the car, thus stopping the car and calling attention to the live stud. The device is rather light in construction and should be strengthened if necessary. It is improbable that a stud will remain alive, except by failure of the spring which lifts the contact. The condition of these springs must not be allowed to deteriorate. Should one of these studs remain alive a horse treading on it would probably be killed, but a foot passenger treading on it would receive a shock which would not be dangerous to life, but which might make him stumble and be run over. I think that an accident of this kind is unlikely, and that the safety device further reduces risk. But as there is no experience in the use of this system, I recommend, subject to the report of Colonel Druitt, that sanction be given for the working of this system for twelve months."

THE electric-light committee of the Sheffield City Council has made the following reply to the complaints of the Sheffield Electrical Contractors' Association, made through the Chamber of Commerce:—That this committee regret that the Chamber of Commerce should lend itself to supporting the efforts of persons who desire to benefit themselves at the public expense, and that the Chamber should have passed the resolution without first communicating with the Corporation to ascertain the facts of the case. The committee recommend the City Council to inform the Chamber of Commerce that the wiring and fittings department of the electric-supply department was necessarily purchased at great cost under Parliamentary sanction as part of the undertaking of the Sheffield Electric Light and Power Company. That work is executed by the department only for persons already consuming electric current supplied by the Corporation or for persons about to become consumers. That in the opinion of the committee it is necessary, in the public interests and for the maintenance of a high standard of work, that the Corporation should continue to execute work of the kind referred to. That all persons and firms in the city carrying on the electric-wiring and fittings business have commenced to do so since the business now carried on by the Corporation was first established. That if it be, as stated, that the wiring and fitting contractors cannot carry on their business profitably, it is due to undue competition amongst themselves. That the committee have on several occasions received deputations of the wiring and fitting contractors, and fully investigated their complaints, and they have entirely failed to substantiate any grievance against the electric-supply department, or to show why the wiring and fittings business, purchased at great cost out of public moneys (the debt for which is still largely unpaid), should be discontinued for the benefit of private traders. The committee have no desire to injure the wiring and fitting contractors in their business. The committee simply carry on the wiring and fittings department as purchased by them with as little competition to the electrical contractors as possible.

THE foundations for the Campanile at Venice are now ready, and it is expected that the construction of the tower will be commenced early this year. It is believed the works will be completed in August 1909.

VARIETIES.

MR. HENRY OUGH, Assoc.M.I.C.E., architect and surveyor, of 64 Basinghall Street, London, E.C., having retired from business, has transferred his practice to Mr. John Moir Kennard, A.R.I.B.A., of 13 Railway Approach, London Bridge, S.E.

THE Greenock School Board have agreed that the new Cartsburn school should not cost more than 11,500*l.* An amendment fixing the sum at 10,000*l.* was lost. The school, which is to be built in Ingleston Street, is a mixed elementary one, with accommodation for 1,000 scholars.

ARCHITECTS who are connected with the Yeomanry are informed that the first number of the *Cavalry Journal* will appear on Monday next. It is published under the direction of Major-General Baden-Powell. The managing editor is Lieut.-Col. Leetham, the editor Colonel Hon. O. Lumley, and the sporting editor, Lieut.-Col. Yardley. The journal will be illustrated.

A DEPUTATION representing the Birmingham Ironmongers' Association and the Master Gas Fitters' Association waited upon the Birmingham gas committee on Monday with reference to municipal trading by the gas department. The deputation was informed that the committee will give its decision shortly.

THE Ilkeston Town Council on Monday discussed a report from Messrs. Willcox & Raikes, engineers, Birmingham, respecting drawings and estimates for Ilkeston sewage disposal works. It was proposed that 15 acres of land should be exchanged for 15 acres belonging to the Stanton Ironworks Company. The grand total of the estimate was 26,940*l.* It was resolved to apply for a loan of 27,000*l.* in connection with the work.

THE river Irwell conservancy committee of the Salford Corporation recently decided to find work for a number of the unemployed in connection with the construction of two new aerating filters at the sewage works. The distress committee issued from the Labour Registry 158 tickets to men for the work. Out of this number only eighty-nine men applied for the situations, and the manager of the sewage works has reported to the committee that three of the men have been discharged for insolence and twenty-one have given in their notices and refused to do the work. The result is that only sixty-five men are actually working, and employment was offered to 158. The work at the sewage works is divided into two shifts of three days each week, and the remuneration is 5*d.* per hour. The average weekly earnings amount to about 11*s.* 3*d.* per week.

THE Cheltenham Town Council are considering a scheme prepared by the borough surveyor (Mr. Pickering) for providing new sewage disposal works at the Haydon Farm, capable of treating the whole of the sewage of the borough before its application to the land, such scheme to include the provision of detritus and screening chambers, septic tanks and continuous filters, at an estimated cost of 34,385*l.*, and also for constructing a new outfall sewer from the Arle tank to the site of the proposed sewage disposal works, at an estimated cost of 10,310*l.*

COLONEL A. J. HEPPER, D.S.O., R.E., Local Government Board inspector, has held an inquiry at the County Buildings, Stafford, relative to the application of the County Council for consent to borrow 75,214*l.* for the purpose of extending the county lunatic asylum at Cheddleton. The attendance included Mr. W. H. Cheadle (county surveyor), Mr. Trollope (Messrs. Giles, Gough & Trollope, London), architect, and Mr. H. F. Pebworth, resident engineer. The asylum at Cheddleton was opened on August 18, 1899, and was originally built to accommodate 618 patients, including both sexes. When the institution was planned the administrative blocks were arranged so as to accommodate more patients without adding to those blocks. The additional accommodation now required was for 400 patients — 200 males and 200 females. The Council estimated the total cost of providing for the additional 400 patients and necessary items connected with the extension of the asylum at 92,000*l.* The estimate on account submitted to the Local Government Board provided for the expenditure of 75,000*l.*, made up as follows:—Two additional blocks of buildings at 9*d.* per cubic foot, 51,174*l.*; hot and cold-water supplies, fire hydrants inside and outside, heating and ventilation, 4,140*l.*; electric lighting, 1,600*l.*; telephones and night clocks, 900*l.*; electric fire alarms, 400*l.*; furniture for 400 patients at 25*l.* per patient, 10,000*l.*; contingencies, 3,000*l.*; architects' fees, 2,900*l.*; quantity surveyor's fees, lithography, advertising, &c, 600*l.*; clerk of works, 500*l.*; total, 75,214*l.*

Are you interested in WOOD PRESERVATION?

Apply to the **ANTHROL** Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of **ANTHROL** and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the **most** efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. **ANTHROL** does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, **ANTHROL**, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The ANTHROL COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON.

ALEXANDRA WHARF.

CONCENTRATION is one of the most important factors in the foundation of a successful business, in fact, success can only be built up where it forms an integral part of a firm's policy. This, while true of all business, applies with greater force where goods of a heavy or bulky nature are handled. But in addition to concentration there are other factors to be considered, namely, facilities for receiving in bulk with the least possible expenditure of time and labour, proper capacity for and method in storing, and means for expeditiously distributing from stock to buyers throughout the country.

With these objects in view Messrs. Hahn & Co. have acquired land at Victoria Docks, London, E., to which have been removed their present large stocks of mahogany, oak and other hardwoods hitherto lying at their three yards situated in various parts of London.

Before doing so, however, the whole area of four acres was planned out by them to afford the utmost facilities for receiving, storing and despatching the immense stocks they hold and are constantly receiving. The wharf has a frontage to the river Thames of 200 feet (where vessels can discharge at all states of the tide) and a depth of over 900 feet. By means of a light railway, specially built and equipped, and which serves every part of the wharf, cargoes are transferred direct from ship to their proper sheds or stacks. On the occasion of our visit the discharge of a cargo of teak had just been completed, and by its aid had been stored in an extremely short space of time.

Numerous sheds, measuring 108 feet, 100 feet, &c., and a large block of offices have been erected, in each case planned to unite efficiency and economy. In the former and on the wharf, in addition to many thousands of dry mahogany logs, were seen 4,000 to 5,000 logs of Austrian crown wainscot oak, 1,500 logs of birch, also large stocks of American whitewoods, hardwood floorings, kauri pine and walnut. We need only mention, further, that a railway siding runs through the wharf having direct connection with all parts of the United Kingdom, to prove that Messrs. Hahn & Co. are in a most favourable position to command the success that the inauguration of Alexandra Wharf deserves.

THE RETTENDON (ESSEX) TILE WORKS.

THESE tile works, which have for many years been carried on by Mr. Hedley T. Rayner and his father before him, have recently changed hands, and the new proprietor is Mr. D. B. Macbride, of 118 Queen Victoria Street, London, who is well known in the City. Evidence that tile-making was carried on in the vicinity as far back as the year 1776 (130 years ago) has been forthcoming in the fact that a tile was recently discovered on a building near Great Baddow Church bearing the date 1776, and we may add that this interesting relic was in a splendid state of preservation, as will be seen by the annexed illustration.

Rettendon, or Rettenden, from which these tile works take their name, is a small and ancient village, situated about 26 miles from London, 7 miles from Chelmsford, 3 miles from East Hanningfield, and near Great Baddow, and includes within its limits the hamlet of Battlesbridge, where is also the nearest railway station. In Domesday Book the name of Ratendune, and in other records Ratyngdon and Rettenden, are given to this parish. This lordship belonged to the nunnery of Ely from the time of its foundation by Etheldreda in A.D. 673, and on the establishment of a bishopric at that place in 1108 (?), Rettenden became part of its possessions, and so continued till the time of Elizabeth, when it was alienated. A manor-house formerly existed here, but it has been so altered and reduced in size as to contain nothing of interest. The church, dedicated to All Saints, is both ancient and interesting, while it is noteworthy that old tiles, some of which have fleur-de-lys centres, have been utilised to pave the chancel.

At the invitation of Mr. Macbride our representative paid a visit of inspection a few days ago to these tile works,

which occupy an area of about 14 acres, with a clay soil, that turns out tiles of a rich red colour. After the clay has been manipulated it is taken from the mixing ground on tip-trolleys by the engine-driven friction-hoist to the pug-mills, where it undergoes another mixing process. After standing for a day or so it is put through a roller-pressing machine, where it is rolled to the desired breadth and thickness, and is then rapidly cut into "bats" for conversion into gables, eaves, and plain and ornamental roofing tiles. These "bats" are at once taken to the drying-room, where they remain for a week or so, and are afterwards taken to the presses, where they are subjected to a pressure of about 20 tons and converted into tiles. Other productions, that is fittings, used in conjunction with the roofing tiles, such as ridges, valleys, hip-tiles, turret-tiles, angle-tiles, finials, &c., are made by hand and hand-power.

From the press the tiles are taken to another drying shed where they are "horsed" so as to give them the requisite curve, and then they are laid in "burns," or heaps of about eighty in number. After remaining here for a matter of four to six weeks, they are transferred on racks to heated chambers, of which there are seven. The heat for the drying process is generated by coke fires, and the hot air is distributed through the drying chambers by an oil engine-driven fan. After remaining here until they are thoroughly dried, which usually occupies a matter of five or six days, they are conveyed to the kilns, which have a holding capacity of about 105,000. It takes twenty-four hours to burn them here, and about six days for them to cool down, after which they are taken to the stacking ground ready for use.

It may also be mentioned that for the production of the necessary power at these works there is a 35 b.h.-p. suction gas-engine and suction gas-making plant by Fielding & Platt, Ltd., fitted with magneto-electric ignition and compressed-air starting arrangement.

The other buildings, in addition to the engine-house, comprise the heated dryer, with seven chambers; two drying sheds with fires underneath, having a holding capacity each of 200,000 tiles; three sheds for summer drying with a straight draught through, holding about 600,000 tiles, and the kilns already mentioned.

At the time of our visit there was a good stock, not only of plain tiles and eaves and gables, but also of all kinds of fittings.

The list of tiles made at these works are of the usual varieties, such as plain, round-ends, clubs, fish-tails, diamond and other ornamental patterns, &c.

It is claimed for these "Rettendon" sand-faced tiles that they give the effect of the old country roof, and with their fine red colour, which weathers down in the old-fashioned style, they are the ideal tile for country mansions, churches, &c., and are fast becoming a great favourite with architects. Another specialty at these works is the smut-faced tiles which, when laid on the roof, have the appearance of genuine old tiles, owing to the smut that is formed by a special process, giving also that touch of "light and shade" which meets with so much approval among those of artistic tastes.

We may add that the new proprietor is overhauling the works with the view of increasing his manufacturing facilities, and is introducing more up-to-date methods, which he anticipates will place him in a position not only to give quicker delivery than hitherto, but also add to the reputation of these tiles by still further improving them.

SAXON PORTLAND CEMENT WORKS.

ABOUT four years ago a description of the new works of the Saxon Portland Cement Company, Ltd., appeared in these columns. Since that time the cement has gained a reputation among users, and although the maximum normal output of the Saxon Works has been increased, it has been found impossible to supply the demand for this brand. The Norman Cement Works have been therefore erected. The main feature of the new works is that the machinery and plant have been arranged so that the product will pass through the entire process of manufacture without handling, thus insuring a considerable economy in labour. The quarry adjoins the works and the trucks of raw material are conveyed by a cableway to the drying drum-house, where it is tipped into two sets of double crushing rolls of a capacity of about 10 tons an hour, and the size of the raw material is thus reduced to about 1¼-inch cube. From the rolls the material is conveyed to two slightly inclined rotary drying drums. These are supplied with the

hot gases from the kiln-house. Instead of having separate furnaces for the drying of the material the waste gases are utilised. The dried material is next elevated to the raw meal grinding-house, where it is subjected to a battery of seven Griffin mills, and from the base of the mills the powdered marl (of a fineness of 1 per cent. residue on a 70 by 70 mesh sieve) is elevated to the mixer, which provides for the mechanical mixing of the powdered raw material in order to secure chemical combination. When it has passed the chemist's tests the raw material is delivered into a silo holding from 200 to 300 tons. From this silo the powdered marl is elevated to the hoppers over each of the five rotary kilns, and in passing from the hoppers to the kilns it is slightly damped to give the material a "bind." The rotary kiln is the most modern and important invention which has ever been introduced in the manufacture of Portland cement. At the present time 75 per cent. of the cement made in America is produced by its means. It consists of a slightly inclined steel cylinder 60 feet long and 6 feet in diameter, mounted on rollers and slowly rotated by gearing.

The finely-ground soft coal which is used for fuel is introduced into the kilns from hoppers at the lower end by a jet of hot air from a blower or fan, issuing under a pressure of about 60 lbs. per square inch. The cement-making material is fed in continuously through a pipe at the upper end of the cylinder, and descending gradually, it meets the heat generated by the perfect combustion of the finely-ground coal fed into the cylinder from the opposite end. The material becomes heated to redness as it approaches the centre of the cylinder, and forms itself into small round balls, which reach a nearly white heat in the lower third of the kiln, and finally issue as well and evenly-burnt clinker in balls about the size of a pea.

The hot clinker is cooled by five cylindrical coolers, each slowly rotating similarly to the kilns. Cold air is drawn through the coolers by the coal-blast fans above, and the heated air thus utilised for the kilns effects an economy in fuel. From the coolers the clinker is transported to a silo, from which it is conveyed to the clinker-grinding department.

A battery of nine Griffin mills reduces the clinker to a degree of fineness equal to that obtained by the ball and tube mills in use at the Saxon Works. The Portland cement then issues as a marketable product, and from these mills the finished cement is conveyed to the cement stores.

The self-emptying storage bin has been designed with a view of eliminating the handling of the finished cement. The stores have a capacity of 10,000 to 15,000 tons, and are in the shape of a large hopper with sloping sides, so arranged that the cement will discharge itself through openings into a tunnel, along which a screw conveyer carries the cement to the loading-house.

The cement is here elevated from the stores conveyer into hoppers over two automatic weighing machines, and at this point—where the mechanically-weighed sacks of cement are ready for loading—the cement is handled for the first time since the raw material was loaded into the trucks at the quarry.

Extensive sidings of nearly one mile in length have been constructed, and adjoin the different parts of the works, where material will be loaded and unloaded.

Three water-tube boilers with super-heaters and patent chain grate stokers supply the power of driving the plant, and three compound condensing steam-engines of a total of 940 i.h.p. drive different departments of the factory. Three dynamos for electric power and lighting for the works, laboratories and offices are also included in the plant.

The coal used for burning cement in the rotary kilns is dropped from the trucks on the sidings into a concrete hopper below, from whence it is elevated to the coal-storage hopper, which has a capacity of 400 tons.

From the hopper the coal is conveyed to the dryer, which also is fed by the waste gases from the kilns. When the coal is perfectly dry it is automatically conveyed behind the boilers to the coal-grinding house, where a battery of three Griffin mills reduces the coal to an impalpable flour. From here the coal dust is conveyed and elevated to the hoppers in the kiln-house ready for blasting to the kilns. A substantial brick building, comprising mess-room, lavatories and bath-rooms, has been provided for the convenience of the employés.

The Norman works of the Saxon Cement Company have been designed by the company's engineer after a careful and exhaustive examination into the latest approved processes adopted in Germany, France, Belgium and America.

CROSLAND HILL STONE, HUDDERSFIELD.

Best Crosland Hill Stone, suitable for all classes of good work, specified by most leading Architects for Church Work and Public Buildings.

Can be supplied in Random Blocks for sawing into Slabs, Panels, Heads, Sills, Mullions, Cornices, or Blocks for Carving, &c.

AN AMERICAN VIEW OF ENGLISH BUILDING.

A REPORT has been prepared by Dr. J. H. Gray on the "Regulation and Restriction of Output" in the United States and Great Britain. The following example is given as an illustration of the methods of the British workman :—

One of the most interesting cases investigated was that of a co-operative society organised to do work as a building contractor. This society, organised nearly a decade ago, and having about 600 members, a share capital of 3,500*l.* and a loan capital of 4,000*l.*, undertook to find the capital and to construct about 50 working-men's cottages for a group of its own members who were organised into another co-operative society for the sake of holding and occupying these dwellings in joint ownership. The contracting society was to have 12½ per cent. above the actual cost of labour and materials for finding the capital and doing the work. The cottages were to be built in blocks of from seven to nine dwellings, each dwelling or cottage to consist of six living rooms, a scullery and other conveniences—no basement, except for coal—a bath-room and water-closet upstairs and closet downstairs, and were to be constructed of ordinary London stock brick, 4,350 to a rod. Nearly all the members of the society for whose use the buildings were to be constructed were also members of the co-operative society which took the contract. These buildings are situated just outside of London. The first block of nine houses was begun and the workmen were dillydallying so much that a general controversy arose between the contracting and the tenant society. After a heated controversy the foreman and one or two of the ringleaders of the workmen were dismissed. The tenant society obtained a release from the contract after the first nine houses were substantially complete except as regards the plastering. Then the tenant society itself, largely with the same workmen, but with a new foreman—a man who had previously been a union man and now had become a small contractor—undertook to build the second block of seven houses. The workmen demanded that the new foreman join the union. This he refused to do, and after a while induced the workmen to proceed with the second block of seven houses. On the second block of houses the foreman received 2*l.* 10*s.* per week as a working bricklayer and 1*l.* as foreman. The bricklayers on the second block of houses were paid 11*d.* an hour, whereas on the first block they were paid 10½*d.*, which was the standard union rate. They worked nine hours per day. The brickwork in each house amounted to nine rods.

The second block of houses was built immediately adjoining the first, according to the same specifications and of exactly the same material, and largely by the same workmen. The brickwork of the first series cost 86*l.* per house and that of the second series 43*l.* per house. Deducting the cost of the scaffolding, estimated at 5*s.* a rod, and two-fifths of the remainder on the first series for labourers who received 7*d.*, against 10½*d.* for the bricklayers, and seven-eighteenths of the remainder on the second series, where the labourers received 7*d.* against 11*d.* for the bricklayers, and remembering that the bricklayers worked nine hours a day, an easy mathematical calculation leads to the conclusion that the average number of bricks laid per day on the first series of houses was about 307, and on the second series of houses was over 648.* That is, this same body of workmen working for a co-operative society of which they were members and on exactly the same kind of work, under similar conditions, laid twice as many bricks per day on the average on the one set of houses as on the other. A somewhat larger force was employed on the first series, there being regularly eight bricklayers and eight labourers, whereas on the second series there were but four labourers and four bricklayers. In a discussion with the workmen on the occasion of the completion of the second series of buildings they at first stoutly denied any restriction of output, but afterwards acknowledged that in the building trades at least there was a feeling that the men did not get as large wages as they

* Assuming that in neither case did the amount properly chargeable to superintendence (that is, in the case of the latter series of houses, for instance, the 1*l.* per week allowed to the foreman in addition to his pay as a bricklayer) enter into the total cost of the brickwork.

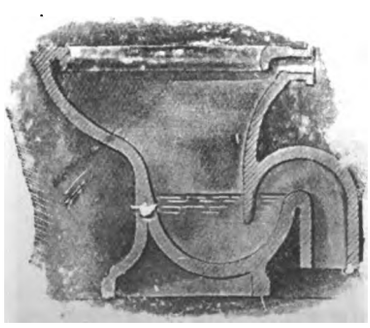
deserved; that striking did not pay; and that a restriction by general understanding was the policy adopted to get even with the builders. When asked plainly why they carried the policy so far as to practise it when building for themselves, their answer was that they could not afford to do more work when building for themselves than when building for private contractors, or else they would give their case away. They further admitted that it was the policy in that district at least for the different workmen to do a uniform amount of work. It took an hour or two to get this admission out of them, but the leading carpenter and also the leading joiner, both of whom had been especially prominent in the controversy between the two societies, finally admitted that, while they had no formal rule requiring uniform wages or a uniform amount of work, practically speaking they enforced both, for the simple reason that none of them proposed to be driven, and that, if the better men set a pace that the less efficient were unable to keep up with, the latter would drop out of the union and would be ready to act as "blacklegs," and thus injure the union when any controversy should arise between the employed and the employer. After much time spent with the president of the co-operative society which owned the houses (he was the chief factor in solving the difficulties between the two co-operative societies), and also with the foreman and workmen on the second series of buildings, the figures for the number of bricks per day on the two series were worked out and submitted in writing to this foreman. In reply he writes:—"I find you are quite correct in your figures *re* brickwork in the —— houses. We are building the brickwork of the second series at half the cost of the first. The sizes of the bricks we use are 9 by 4½ by 2½ inches. The outside walls are 9 inches thick, the main party wall between houses 9 inches, the walls dividing rooms are 4½ inches thick; the foundations are one course 8 inches, one 14 inches thick under the 9-inch walls, and 14 inches and 9 inches under the 4½-inch walls. It takes longer to build facing work than inside—I should say about one-third. We work Flemish bond and use greystone lime, one-third (one part) lime to three parts sand."

Although, as will be understood from the foregoing statement, there is much calculation even in this case, the facts, while not capable of accurate statistical determination, are sufficiently plain to throw a flood of light on London building methods. It ought to be remarked in regard to the foreman on the second series of buildings that, although he had been a member of the union before he became a small employer, or pieceworker, as they call it in England, he is clearly of the opinion that there is restriction of output, and not only refuses as foreman to join the union, but expresses the opinion that the union is injuring the country by slowing up on the rate of work. It was also learned in this connection from the president of the co-operative society, the foreman of the buildings and the chief plumber on the second series (the chief plumber on the first buildings was dismissed for dillydalling) that the cost of the plumbing in the houses was reduced more than 42 per cent, the major part of which was saved in the cost of labour, although the foreman stated that there had been a great deal of material wasted on the first series. The plumbing conveniences in the two series of buildings were absolutely identical. According to this foreman, the previous foreman had used very much more water-pipe than was necessary in reaching the bath tubs. It seems that the shaking-up that the different sets of workmen of these buildings got affected the whole working force. While figures could not be obtained for the carpenterwork, painting and plastering, it was the universal story of the men doing this work (and they were largely the men who did the work on the first series) that the cost had been very greatly reduced on the second series.



Although it may be true that co-operative building is not typical in general of building by private contractors, after interviews with nearly every workman on those buildings, the president of each of the co-operative societies involved, and the foreman, the conclusion was reached that there was great and deliberate restriction of output in the various branches of the work, and that, too, under circumstances which in and of themselves, in the self-interest of all the parties concerned, would have led to the greatest possible economy of time and the putting forth of the highest effort consistent with health and comfort. The only explanation for the unquestionable facts in the case is that the men were doing on this first series of buildings what they were accustomed to do in large measure on public works and under independent contractors.

TO BOROUGH ENGINEERS, SURVEYORS, ARCHITECTS, &c.

Hassall's Patent
Water Closet.

AWARDED THE MEDAL OF THE SANITARY INSTITUTE, 1902.

IMPORTANT IMPROVEMENT IN FLUSH-DOWN W.C.'s.

SECTION.

ADVANTAGES.

Absolute and perfect flush guaranteed with 1½ gallons of water.

ABSOLUTELY NOISELESS.

Not depending on syphonic action.

No double trap required.

The whole surface of pan perfectly cleansed each time of flushing.

Telephone, No. 20 Swadlincote.

ARCHITECTS AND BUILDERS PLEASE NOTE.

CALL AND SEE THE PATENT "GASCOL" STOVE.

The special attention of all Architects and Builders is called to the "GASCOL" patent stove, which is a self-setting stove, which can be heated by either gas or coal, or both at once, effecting a great saving when a small fire is required for warming purposes.

Some Striking Advantages of the "GASCOL"

The "GASCOL" patent stove is constructed on scientific principles, and is exceedingly economical in use, the Oven, with tap full on, consuming but 10 feet of gas per hour. It is strongly built and the fittings are of the best quality. The change can be made in a moment from coal to gas, or *vice versa*. The Gas Hot Plate is fitted with one Boiling Burner, one Simmering Burner, and one Combination Griller and Boiling Burner, with Rise and Fall Double Deflectors, along with a strong tinned Grill Pan and Grid. The Oven is fitted with two Burners, two Runners, one Grid Shelf, and one Browning Sheet, all of which are detachable, and can be easily removed for cleaning. The Gas Connection can be made either at back or front of the Range. The "GASCOL" is simple in action, automatic in working, and is the ideal cooking stove for villas, flats, &c. It is, moreover, exceedingly moderate in price. All Architects and Builders are requested to call and see the "GASCOL" at any of the leading Wholesale Ironmongers, or it may be seen in operation at the showrooms of

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels.

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM. From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the originals, mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRY BEYAART, Architect. This work contains the most interesting productions of Henry Beyaart, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14 8s.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM.

The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

Established A.D. 1774.
AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy Work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.
They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.
N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

Why Have Damp Walls?
AN ABSOLUTE CURE is
THE ERIMUS DAMP-PROOF PAINT,
Which provides a PERFECT PROTECTION AGAINST DAMPNESS, and renders outside brickwork HARD & WEATHER RESISTING. Lasts much longer than Paint, and cheaper.
WOOD, IRON ROOFING and METAL WORK may be coated with it.
Invaluable as a GROUNDWORK for SIGN-WRITING on Walls.
Is applied in the same way as ordinary paint.

THE

Architect and Contract Reporter.

FRIDAY, JANUARY 19, 1906.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 Imperial Buildings, Ludgate Circus, London, England.

*** *Entered in the United States of America as second-class matter. Agents for America, The International News Co., 5 Bream's Buildings, Chancery Lane, London, England, and New York.*

Important Notice to the Architects and Civil Engineers of Westminster.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Ltd., to establish Branch Offices in that district at 43 OLD QUEEN STREET, S.W., *Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.*

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

The Birmingham Offices are at 102 COLMORE ROW.

AGENTS FOR THE COLONIES.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BIRMINGHAM.—March 31.—For extending the present municipal buildings. Sketch plans only are required to be sent in by March 31, and from those submitted a selection of not less than six nor more than ten will be made, the authors of the selected designs receiving each an honorarium of 100 guineas upon submitting complete designs in a final competition. Sir Aston Webb, R.A., and Mr. E. Ingress Bell will act as professional advisers in this competition. Deposit 1*l.* 1*s.* The Town Clerk, Council House, Birmingham.

CROMPTON.—Jan. 31.—For a Carnegie free library. Premiums of 30*l.*, 20*l.* and 10*l.* are offered. Deposit 10*s.* 6*d.* Instructions from Mr. F. F. Gartside, clerk, Town Hall, Shaw, near Oldham.

WALES.—March 20.—For a free library to be erected in Bangor at a cost not exceeding 3,000*l.*, inclusive of architect's charges. Premiums of 25*l.* and 15*l.* respectively will be paid to the authors of the two approved designs. Premium for successful design to merge into the architect's commission. Deposit 1*l.* 1*s.* Application to Mr. Wm. H. Worrall, clerk to the general purposes committee, Municipal Offices, Bangor, North Wales.

CONTRACTS OPEN.

EUBOEOLITH.

THE application of asphalte in the paving of streets demonstrated the utility of a surface without joints. The opposition was, of course, powerful, but eventually the advantages were so manifest that the new pavement was almost universally adopted. It is no exaggeration to say that the revolution which asphalte accomplished in the streets and open spaces of cities and towns will be repeated by euboeolith in respect of the floors of buildings. In the first place it can be laid on any kind of foundation, concrete, flagstones, wooden floors, and as the entire area, however large, can be covered, as it were, with one piece, there are no joints. It is needless to say that in hospitals joints are a bane, whether on walls or on the floor, for they harbour dangerous microbes ; with euboeolith there is no shelter for those agents of evil. It is also an advantage that a bordering can be shown, and the floor will therefore have a completeness which is equal to that of parquetry. We have mentioned hospitals, but the euboeolith flooring is no less adapted for offices, warehouses, schools and public institutions, and, in fact, wherever men congregate in buildings. Although the flooring has been so lately introduced, it is calculated that over 600,000 yards have been laid. The Germans, following out their scientific conclusions, have adopted a jointless flooring on a large scale, but euboeolith is a British product, and will sustain more severe tests than any other jointless flooring. It is also economical. Architects who desire more detailed information can obtain it on application to Mr. J. Percy Day, the manager.

NOTICE.—The TORBAY PAINT COMPANY desire to express their sincere thanks for the numerous sympathetic letters received from their customers owing to the recent fire at their Branch Dartmouth Works, and are pleased to be in a position to state that it will not interfere with the due execution of orders, which will be despatched as heretofore from their principal Works at Brixham, Torbay, Devon ; 26-28 Billiter Street, London, E.C. ; and 8 India Buildings, Fenwick Street, Liverpool.

TRADE NOTES.

MESSRS. IRVIN & SELLERS, timber importers, of Bootle, are now prepared to send their steel foot-rule, which is made by Chesterman, to readers of *The Architect* on application.

THE Keynsham workhouse infirmary is being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE learn that the marble mosaic paving for the new sub-stations at Battersea, Streatham and Wandsworth, now being completed in connection with the South London tramway system of the London County Council, has been entrusted to the Atlas Stone Company, Ltd., of Cambridge. This firm carried out similar paving at the New Cross and Camberwell sub-stations for the London County Council, and had the satisfaction of having their work mentioned to the trade by the works department as examples of what was required for the new sub-stations above mentioned.

THE May-Oatway Fire Appliances, Ltd., inform us that they have succeeded with the fire offices committee in obtaining a reduction on the cost of insurance to users of approved automatic alarms. The rates have not yet been announced, but the May-Oatway Co. have been notified that their system has been approved and will duly carry a rebate. At the end of 1904 they put in a petition headed by the Glasgow Corporation and influentially signed, asking for this concession, which has now been granted to them, as well as other approved systems. Messrs. May-Oatway are to be congratulated on their success.

WE have received the following notice from the Delta Metal Company, Ltd. :—"We beg to inform you that we are this day closing our works at Pomeroy Street, New Cross, London, S.E., and that in future our London business will be carried on exclusively at our new works, East Greenwich, London, S.E. The new works are fitted up with plant of the most modern type, and are particularly laid out with a view to the rapid production of our specialties on a large scale. The greatly increased facilities for output will enable us to execute orders at the shortest possible notice, and to give immediate attention to urgent
